

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE AMERICANA

Vivien de Saint-Martin, vè-vè-ân dé sâ-ma-r-tân, Louis, French geographer and author. b. Saint-Martin-de-Fontenoy, France, 17 May 1802; d. Paris 3 Jan. 1897. He early devoted himself to geography, his first work 'Carte Electorale' appearing in 1823. He founded and conducted in 1828-30 'Bibliomappe,' a geographical journal, and subsequently was engaged for many years in various labors of translation and editing. He was one of the founders of the Paris Geographical Society, and in 1863-76 he edited the 'Année géographique,' a post which he resigned to assume direction of the 'Nouveau Dictionnaire de géographie universelle.' His works include: 'Description de l'Asie Mineure' (2 vols. 1845); 'Etude sur la géographie grecque et latine de l'Inde' (1848-60); 'Atlas universel de géographie, moderne, ancienne, et du moyen âge' (1877), etc.

Viviparous Animals, the name given to those animals which bring forth their young alive. Properly speaking, the name should be limited to that form of reproduction seen in Mammalia alone, in which the young during the whole course of their development are contained within the parent body, and bear to the parent organism a definite and intimate degree of relationship. Thus in Mammalia the young animal is contained within a special cavity, the uterus or womb, and is nourished by the blood of the parent during its development, while only at birth does it pass from the body of the parent to the outer world. See **REPRODUCTION**.

Vivisection—Its Influence on Surgery. I have been asked by the editor of 'The Encyclopedia Americana' to write a brief resumé of the influence of vivisection on the progress of modern surgery. I shall do so as briefly as I possibly can, stating only facts which are generally well known to surgeons, but of which the general public of necessity must be ignorant to a great extent. Most of the facts below stated are known to me personally, as they have occurred during my professional lifetime; and I can, therefore, vouch for their accuracy.

If a physiologist were asked to contribute a similar paper he would be able to tell a similar story as to the revelations of the functions of various organs in the human economy obtained through vivisection; if a professor of pharmacology (that is, the action of drugs upon the living body) were to write a similar paper he would be able to show an equal debt owing to animal experimentation, first in giving us an exact knowledge of the action of drugs, and, secondly, in the introduction of a large number of new drugs. In this was cocaine was introduced into medicine and the proper use of such a powerful drug as digitalis was shown.

If a medical man were to write a similar chapter he would scarcely know where to begin. The whole life history, for example, of the *Trichina* has been studied in animals and the results applied to man, so that if every one would heed the warning no one need die from the trichina worm in pork. This has had also

an enormous commercial value, since all our hog products are exported on condition that the trichina be excluded by microscopical examination. In diphtheria the percentage of deaths has been reduced in Baltimore from about 70 per cent to about 5 per cent. The saving of human life in a single year in New York has been 1,500. All this is due to the antitoxin of diphtheria, which has been evolved almost solely as a result of animal experimentation.

Two water companies in London in 1853 experimented on 500,000 human beings, and, as a result of the cholera, one of them killed 3,476 human beings. In that same year Thiersch, in Leipsic, experimented on 56 mice. Had the lesson of these few mice been heeded the lives of these human beings might have been saved. More than that, even at the present day, as a result of Koch's discovery of the cause of cholera, Haffkine, in India, is making protective inoculations which are proving of the greatest value. By the same method we have recently discovered that the bubonic plague is spread by rats, and that efficacious vaccines can be used against this dreadful disease; that the malarial parasite and yellow fever are spread by mosquitoes, as proved by studies in birds and in human beings; and the preventive inoculations against typhoid (as yet in the early stage of their use, have been discovered by the same means.

Let me give one illustration of the method by which the cause of one disease—tuberculosis—was proved. Similar methods are employed in tracing the causes of others. In a case of consumption of the lungs the expectoration is examined by the microscope after applying a staining material. Without staining the tubercle bacilli are so translucent (like little rods of jelly) that we can scarcely see them. Having found this peculiar germ in the expectoration, some of the material is injected under the skin of a guinea pig or mouse. After a certain time the animal either dies or is killed, and a post-mortem examination is made. If there are found in the body of the guinea pig little nodules—that is, tubercles (little tubers)—these are examined by the same method and the same germs will be discovered and can be obtained in a pure culture. But the circle of proof is not yet complete. A small portion of this pure culture of the germs obtained from the inoculated animal is again injected into another animal, and if the second animal suffer from a similar disease and the same germ be found again, the conclusion is irresistible that the cause of the tuberculosis is the peculiar germ always found in such cases.

I well remember the incredulity with which I first read of the origin of lockjaw from the soil, but very soon this incredulity was changed to belief in the face of absolute demonstration after this fashion: It had been well known for years that hostlers, cavalymen, farmers, and persons who were engaged in any occupation about horses were peculiarly liable to lockjaw. After the discovery of the bacillus of lockjaw in 1884, by Nicolaier, when a case of lockjaw occurred, the ground on which the patient had fallen, or the instrument by which he had been

VIVISECTION

hurt, was examined, and a certain bacillus was found in or on it. This was inoculated into animals, and was found to produce the same disorder; and the same bacillus was recovered from the animal's body, was re-inoculated, and reproduced the disease. The circle of proof, therefore, was complete. This explained the popular belief that treading on a rusty nail is a frequent cause of lockjaw; not because it was a nail or old or rusty, but because the germ of lockjaw was on it and in the ground in which it was lying. No such exact experiments are justifiable on man. The sacrifice of a few rats quickly gave us all the desired information. This has abolished lockjaw as a result of surgical operations, and enabled us to cure it in many cases even after accidental inoculation. Before 1884 it was both frequent and fatal; now it is almost a surgical curiosity, except after neglected accidents.

The two most important surgical discoveries of the 19th century were, (1) anesthesia, especially by ether (in 1846) and by chloroform (in 1847); and (2) antiseptics, by Lord Lister, who began his work soon after the middle of the 19th century and had distinctly formulated it about the end of the '60s. His remarkable paper in 'The Lancet' of 3 April 1869 (when he was simply Mr. Lister, professor of surgery in the University of Glasgow), was one of those papers which marked a new era in surgery. Several years before he had announced that he believed that inflammation and most of our surgical disorders were due to germs, and that if we could exclude these germs we would be able to secure the healing of wounds without inflammation and without the formation of pus (matter); yet it was not until 1881 that Ogston and Rosenbach discovered the germs which produce the terrible results of inflammation, such as erysipelas, hospital gangrene (what irony in the name!), abscesses, blood poisoning and even death.

Hemorrhage.—One of the most important contributions by Lister to the progress of surgery was the introduction of antiseptic threads (ligatures) of catgut, with which to tie blood-vessels. An early Philadelphia surgeon, Philip Syng Physick, tried to get rid of the dangers following silk, which had been used to tie arteries ever since Ambroise Paré introduced it in the 16th century as a happy substitute for the horrible hot pitch and hot iron which then were the only means for arresting hemorrhage. Physick sought to use buck-skin, on the ground that it was an animal substance and would, therefore, disappear by absorption. Dorsey used catgut. Hartshorne used parchment cut in fine threads, and Bellinger and Eve the tendon of the deer. But none of these surgeons succeeded in giving us harmless ligatures until Lister taught us how to use them. In the paper to which I have referred he showed that the old idea of a ligature was that it was a foreign body which was ultimately to be got rid of by its rotting through the walls of the blood-vessel. The result was that in a very large percentage of cases the blood-vessel was not stopped by a clot; secondary hemorrhage took place (usually during the second week after an operation), and many a patient bled to death.

I shall never forget one night in the Satterlee Hospital in West Philadelphia, about 30 days

after the battle of Gettysburg, when I was called five times to check just such secondary hemorrhage from the rotting through of silk ligatures. As a consequence of the introduction of antiseptic ligatures by Lister I do not recall in the last 20 years five cases similar to these five that I then attended in one night. In other words, secondary hemorrhage has almost disappeared from surgical experience.

How did Lister find out the proper method of tying an artery? On 12 Dec. 1867, he tied the great carotid artery in the neck of a horse with a piece of pure silk saturated with a strong watery solution of carbolic acid, cutting both ends of the thread short and dressing the wound antiseptically. Healing took place without any inflammation. Six weeks after the operation he investigated the parts by dissection, and found that if the thread had not been applied with the antiseptic precautions secondary hemorrhage would unquestionably have occurred, and in all probability the animal would have bled to death. On 29 Jan. 1868 he applied this principle in the case of a woman of 51 with an enormously dilated sac (an aneurysm) in the upper part of the great artery supplying the thigh and leg. She, like the horse, recovered without inflammation, and lived for 10 months. On 30 November she suddenly died as the result of a rupture of a similar dilatation of the aorta in the chest. This gave Lister the unusual opportunity of examining in a human body the result of his application of an antiseptic thread to the arteries. The case emphasizes one of the great difficulties in studying such questions on human beings. The opportunity for a post-mortem examination after such an application of a new principle can only be occasional. If this woman at the time of her death had been under the care of some other surgeon than Lister no such careful examination of the consequences of the tying of the artery would have been made, and no further progress would have followed. The result of his examination showed that in spite of his care an incipient abscess was developing at the point at which he had tied the artery. This was in consequence of the presence of the thread, and especially of the knot.

As a result of this investigation, on 31 Dec. 1868 he tied the carotid artery in the neck of a calf with catgut which had been prepared with carbolic acid, and all antiseptic precautions were used during the operation. The calf recovered perfectly, and in 30 days was killed and the parts dissected. He found that at the site of the thread of catgut, replacing the thread, there was a band of living tissue which closed the artery, and that, therefore, instead of the thread rotting through, as was the case with the silk, it had become a part and parcel of the tissue. The artery, instead of being so weakened as to allow of secondary hemorrhage, was really stronger at this point than at other points. The ligature and the knot had entirely disappeared.

I have narrated this somewhat in detail for this reason: It illustrates admirably the method of scientific progress by experiment upon animals. Neither of these animals suffered any material pain, both operations having been done with the same antiseptic care as in a human being. Both of them were killed at such a time as would facilitate our knowledge of the results.

VIVISECTION

Since then other experimenters have tied the blood-vessels in animals and have killed them at varying intervals and made microscopical examinations of the blood-vessels. In this manner our knowledge of the way in which hemorrhage is stopped is now complete. The knowledge which was attained within a short time by the sacrifice of a few animals would have been attained only after many years by occasional post-mortems, and would then have been very much less perfectly attained and by the loss of many human lives instead of a few animals' lives.

Contrast, now, the result of the old and the new surgery in the mere matter of stopping hemorrhage after operations or accident by tying blood-vessels with the old ordinary silk and the modern antiseptic catgut, or with silk itself as now used by improved methods. In the old way the blood-vessels were tied with silk, which was as clean as an ordinary housewife would have it. One end was left long, and it was no uncommon thing after an amputation of the thigh to have as many as 20 or 30 of these ligatures or threads hanging out of the wound. After two or three days, when those on the smaller blood-vessels would possibly be rotted through, each ligature was pulled upon, and those that were already loosened by putrefaction came away. Finally, at the end of 10 days, two weeks, or three weeks, the ligature on the great blood-vessel of the arm or the thigh came away, not uncommonly followed, as has been stated, by profuse and often fatal hemorrhage. Sometimes, as in Lord Nelson's case, such a ligature did not rot away for years, and required dressing of the arm all of this time on account of the constant discharge.

What happens to-day in a surgical operation where either properly prepared silk or catgut is used? We tie all the blood-vessels needing it, cut off both ends of the threads short and close the wound entirely; and, instead of having discharge and horrible inflammation for days and often weeks and sometimes months, it is now a rare thing for such a wound not to be entirely healed within 10 days, and sometimes less, and secondary hemorrhage is almost unheard of. If vivisection had given to surgery only the modern means of stopping hemorrhage it would be worth all the labor it has required and all the suffering it has inflicted on all the animals ever experimented upon.

Of late a new problem in hemorrhage has been presented. When an artery is wounded—as, for instance, if the blade of a pocket knife has been thrust into the thigh and wounds the great femoral artery—the only way to prevent the patient's bleeding to death has been to expose the artery and tie it above and below the point where it was cut. Of late several surgeons (especially Murphy, of Chicago) have made some very ingenious experiments on such wounded blood-vessels. They have carefully exposed the artery of an animal (under an anesthetic, of course), have wounded it, and then, instead of tying the artery, have sewed up the wound in the wall of the artery to see whether this could not be done successfully. The reason for this series of experiments is this: When we cut off the supply of blood to a leg or an arm by tying the blood-vessel, gangrene not uncommonly occurs, because the chief blood supply of the limb is cut off by

tying the artery. If instead of tying the vessel we can sew up the wall and it will heal, the current of blood is uninterrupted and there is no danger of gangrene. Matas of New Orleans has cured even aneurysms by sewing up the walls of the arteries in a similar manner—a great recent advance in the treatment of this often fatal disease. One thing is perfectly manifest—it would never be proper to make such experiments on human beings. Human life would be endangered, and no surgeon would adopt or would be justified in adopting such a novel procedure until it had been tried and proved successful on animals. Several successful cases of suture (sewing) of the large blood-vessels have now been done in man.

The Brain.—When I first taught anatomy, 38 years ago, the various portions of the brain were not supposed to have separate functions. We knew, of course, that disease or an injury on one side of the head produced paralysis on the opposite side of the body. Broca also discovered by observations on man in actual cases of disease that when that part of the brain corresponding to the left temple was affected the power of speech was lost. But if a man had a fracture of the skull or a gunshot wound in the region above the ear or in the front of the brain or the back of the brain, there was no well recognized difference in the results. This was largely due to the fact that such injuries are widespread, and not limited to small areas. In Germany Fritsch, Hitzig, and Goltz, and in England Horsley, Ferrier, Schaeffer, and others, pursued the following plan: The monkey's brain is the nearest in similarity to man's. A known portion of the brain—for instance, the region above the ear—being exposed, the brain was mapped out in small squares and each one of these squares in succession had the pole of a battery applied to it. The phenomena which occurred—whether opening and shutting the eyes, turning the head right or left, contraction of the muscles of the arm or leg—were all carefully noted down. In this way a distinct map of the brain was made, so that now we know definitely that a certain area of the surface of the brain governs the movements of the eyes, of the head, of the arm, forearm, hand, thumb, thigh, leg, great toe, etc. In the same way at the back of the head the area which governs sight has been found, and it was discovered that the area on the right side if destroyed made the right half of each eye blind, and that if the area of the left side was destroyed the left half of each eye became blind. This description is, probably, sufficient to indicate how physiologists and surgeons have investigated the brain.

The following is an instance which shows how accurately this method has enabled us to locate the motor centres in the brain: A girl who suffered from epilepsy and in whom the convulsions always began in the right thumb, and then spread to the arm and the body, was operated upon. A piece of the gray matter of the brain, as large as the last joint of the forefinger, was removed from the place determined upon animals as the centre governing the movements of this thumb. When she awoke from the ether every muscle moving the thumb was entirely paralyzed, and no other muscle in the body. When we remember that the muscles which move the thumb arise in the

VIVISECTION

ball of the thumb, between the thumb and the forefinger and on the front and the back of the forearm nearly as high as the elbow, this is seen to be most remarkable. I do not know a single case ever recorded of so minutely located disease. By no other means than vivisection could this small thumb centre have been determined. She entirely recovered from the paralysis, and her epileptic fits instead of being almost daily were reduced to one or at the most two a year. This has made possible the modern surgery of the brain, which would not exist to-day were it not for vivisection.

Here and there an unexpected post-mortem examination, as in the case of Lister's woman patient, has given us some special information, but nine tenths if not ninety-nine one-hundredths of our knowledge of cerebral localization is the result of exact experiment on animals. As a consequence of this in 1884, for the first time in the history of surgery, the existence of a tumor of the brain, which was not indicated by anything on the outside of the head, was diagnosed, its location determined, and the tumor removed. When the skull was opened no tumor was visible; but so confident was Mr. Godlee, the surgeon, that he cut boldly into the substance of the brain and there found the tumor which had been so accurately diagnosed. Since then this first achievement has been repeated not only scores, but hundreds of times, and the net result up to 1899 was that 491 brain tumors had been operated on. In 64 palliative operations for the relief of headache, blindness, etc., the mortality was only 15.6 per cent. In 275 completed operation, 82 died, a mortality of 30 per cent. In 43 cases in which the tumor could not be removed, 20 died, a mortality of 67.5 per cent. In 109 cases in which the tumor was not found, 57 died a mortality of 52 per cent. This localization of cerebral functions, together with antiseptics, has so revolutionized (or, rather, created) modern cerebral surgery that the principal facts are a matter of common knowledge. Tumors are now attacked not only in what is called the motor area (that is, that portion of the brain governing movement, which, roughly speaking, may be described as lying above the ear), but many times in the front part of the brain, and at the back of the brain, far outside of the motor area. In case the tumor is at the base of the brain, or at certain other parts this knowledge has prevented useless operations which otherwise might have been performed.

It is a source of sincere gratification on the part of numerous surgeons that by this same knowledge of cerebral localization derived from animal experimentation they have been able to recognize hemorrhage inside the skull, open the skull at the right point, even when there was no fracture, and save their patients. Before experiments on animals showed us how to interpret the symptoms this was an impossibility, and nearly all such patients died. Now we save, roughly speaking, two out of three.

Time and space would fail me to tell of the abscesses of the brain, of the foreign bodies in the brain (such as nails driven into it by accident or design, rifle balls which had lodged in it) and of many other similar surgical disorders the modern successful treatment of which depends directly upon the localization of cerebral

functions, which is the result almost wholly of experiments upon animals.

The Spinal Cord.—Up to the present time the belief of surgeons has been that in case the spinal cord was completely cut in two, either by gunshot wounds, fracture of the spine or otherwise, no reunion of the two ends would take place, and, therefore, there was no possibility of relief for the paralysis below the point of division of the cord which is almost always fatal. Very recently, at the Pennsylvania Hospital, Dr. Francis T. Stewart had a patient whose spinal cord was cut in two by a bullet. He removed the bone sufficiently to get access to the spinal cord, and found it completely divided. He immediately stitched the two ends together, and, strange to say, this patient has recovered both feeling and motion to some extent in both legs. Since his case two or three other similar cases of recovery of sensation and motion have been reported. I think it would be evident to any person that such a totally unexpected result deserves the most careful investigation. In man cases of such complete division followed by recovery are almost unknown; and if they had to be studied in man this would be imperfectly done, and probably would require 15 or 20 years before we would know what ought to be done. It is one of those cases in which it is our duty to investigate by experiments upon animals what is the best method of sewing the two ends of the spinal cord together; at what date after division of the cord it will be hopeless to do so; how much of the cord can be lost (that is to say, a half inch, inch, or more) and yet by stitching the two ends together it will be possible to restore the function of the spinal cord. One can see very readily that in animals all these problems can be studied minutely, in a sufficient number of cases; various procedures can be tested and the results determined accurately by killing such animals at a suitable date, and a definite conclusion can be reached in a short time.

In 1888 Mr. Horsley, the distinguished London surgeon, and Dr. Gowers, equally distinguished as a neurologist, for the first time in the history of surgery made a diagnosis of a tumor of the spinal cord, definitely located it and the former removed it, the patient making an absolute recovery. A number of other cases have been successfully operated on since then. Just as in the case of tumors of the brain, this would not have been possible had it not been for experiments upon animals, which have given us practically most of our present knowledge of the minute anatomy and physiology of the spinal cord and have, therefore, enabled us to deal with it surgically.

Nerves.—Among the most fruitful branches of research which have been so valuable in results are the animal experiments upon the different nerves of the body. The methods by which nerves could be sewed together; the possibility of taking a portion of a nerve or even of the spinal cord from a rabbit or other animal to replace a piece of the nerve when it has been destroyed by accident or disease; the possibility of sewing one nerve to a neighboring nerve in order to re-establish its function—all of these and other similar operations have been studied in animals, and could only be studied in animals with exactness.

VIVISECTION

In order to study such conditions it is not enough that the two ends of the nerve should be sewed together and then, after the wound was healed, that we should simply determine the fact that the functions of the nerve are re-established. It is necessary to know by the microscope the various steps of the process of union of the nerves—to investigate various methods of sewing them together; whether they can be overlapped, or must be applied exactly end to end; whether one end of the nerve can be split and the other inserted into it, or turned over as a flap, and so on. Evidently numerous methods can only be studied on animals. Then, when the results are known, we can apply them for the benefit of man.

The Thyroid Gland—One of the commonest diseases in Europe, and one that is occasionally seen here, is goitre. This forms a large tumor in the neck, for which formerly little could be done, as operation was nearly always fatal. Such patients were obliged to go through life with a dreadful deformity, in the greatest discomfort, and were sometimes suffocated by pressure on the windpipe. In consequence of the introduction of the antiseptic method of Lister, which we owe to vivisection more than to any other agency, operations on the thyroid gland are now so common that at the German Surgical Congress Professor Kocher, of Bern, has reported 2,000 operations done by himself, with a mortality of only 4 per cent.

Very soon it was discovered that removal of the entire gland produced a curious effect. The face became bloated; the expression greatly changed, and the patient became more or less idiotic—that is, the condition known as myxedema followed. This led to improvement in operations in several directions. First, in all those cases in which the tumor could be shelled out, as an English walnut is turned out of its shell, leaving a portion of gland tissue behind, this was done. The similar effects of the removal of the thyroid in animals were studied especially by Mr. Horsley. Surgeons then removed the thyroid gland from the neck of an animal and placed it under the skin of the same animal, and it was found that the disastrous results were avoided. After a number of experiments on animals there was good reason to believe that the disastrous effects of the operation which sometimes followed goitre could be avoided in man by the same procedure. Accordingly after removal of a goitre (that is, the enlarged thyroid gland in man) the thyroid gland of a sheep was transplanted in a number of instances under the skin, or in some cases into the abdominal cavity of the patient. In both cases there was improvement for a time; but eventually the majority of the cases suffered from cretinism or from myxedema, which may be described as a less severe form of the same disease. Finally in animals a study was made to determine how much of the gland must be left in order to prevent myxedema, and now we are able to relieve patients from goitre and yet, by leaving enough of the gland, prevent any bad results following the operation.

These results led also to a careful study of the effects of giving an extract of the thyroid gland to human beings. Some of the most brilliant results that have ever been obtained in medicine have followed the administration

of the thyroid extract to cretins in whom the disease had not been produced by operations for goitre, but arose naturally. In certain forms of goitre it has enabled us to relieve or even to cure without operation. In insanity and many other mental states it is used as a well established remedy, which in even a large percentage of cases is followed by great benefit and often by cure. In many other diseases also the thyroid extract has been used with the best results.

The Larynx.—Cancer of the larynx, or that part of the windpipe back of and just below the Adam's apple, is not at all uncommon. The only hope of such patients is in removing the entire larynx or voice box. Before attempting this for the first time on man Billroth, of Vienna, and his assistant, Czerny, now the distinguished professor of surgery at Heidelberg, tested the operation on several dogs. Billroth then removed the larynx from his patient and saved his life. This operation has now been successfully repeated scores and scores of times as a result of these few experiments on dogs.

The Lungs.—A beginning has been made in the surgery of the lungs, but as yet we have not reached the point where we can say that we have attained entire success. In a number of animals parts of the lungs have been cut out with a view of discovering the possibility of cutting out diseased portions of lung, the seat of tumors, consumption, and other disorders, and a few operations have been done upon man, with a fair percentage of success. Not uncommonly abscesses of the lungs which were perfectly inaccessible a few years ago have been reached and opened. Sometimes coins and other foreign bodies get into the bronchial tubes, and can only be reached through most difficult and dangerous operations. Several surgeons have experimented upon animals to determine the safest method of removing such bodies, but with only partial success. Is it not evidently our duty to devise new operative procedures and test them on animals first, and when a reasonably promising one has been found, to apply it to man?

The Liver.—In 1890 Ponfick, of Germany, showed that in rabbits the removal of a quarter of the liver caused a slight deterioration in the condition of the animal; removal of one half was followed by much more serious symptoms, which, however, passed off within a few days. Even removal of three fourths of the whole liver could be recovered from, but removal of more than this was always fatal. By killing the animal in which a small part had been removed at a suitable time, and studying microscopically the liver tissue at different periods of time after operation—a procedure manifestly only possible in animals—he showed that there was a reparative power in the liver, which before then was unknown.

Up to that date less than a dozen surgeons had operated on tumors of the liver. In only two of them was any considerable portion of the liver removed. After the paper by Ponfick, which showed how much could be removed, surgeons immediately operated with much more confidence, and removed considerable portions of the liver. Up to 1899, 76 tumors of the liver had been removed. Of these cases the termination of two was unknown; of the remaining 74,

VIVISECTION

63 recovered and 11 died—a mortality of less than 15 per cent. One who is not a surgeon can scarcely appreciate how differently the operation for tumor of the liver was regarded before and after Ponfick's experiments. Before that everything was marked by timidity; after that everything was marked by confidence, and all to the benefit of the patient.

The Spleen.—The same story that has been told of the liver can be told of the spleen, though with much less good results. As a result of studies, partly by accident, in man (as when in consequence of a stab-wound or other injury a spleen would protrude through the wall of the abdomen, and would have to be removed), but chiefly as a result of the careful studies of removal of the spleen in animals, beginning practically with Schindler's experiments in 1870, we are now in a position definitely to say that in man the whole of the spleen can be removed, and he can not only survive the operation, but get along comfortably without any spleen. A very considerable number of such operations have now been successfully performed.

The Kidney.—On 2 Aug. 1869 Professor Simon, of Heidelberg, laid the foundation of the modern surgery of the kidney by removing a healthy kidney from a healthy woman. The reason for it was that in removing an ovarian tumor some time before he had been obliged to remove a part of the ureter (the tube leading from the kidney to the bladder), and to fasten the cut end to the skin. As a consequence of this the woman was in a most deplorable condition from the continual escape of urine over her person. After a number of unsuccessful attempts to close this external opening, it finally occurred to him that the only way to cure her was to remove the kidney on that side. Whether a human being would recover and could live with only one kidney was practically unknown. It is true that disease had destroyed one kidney in some patients and the other had gradually developed ability to do the work of both. Injury also had destroyed parts or all of one kidney; but deliberately to take out a healthy kidney from a healthy human being was an operation not only fraught with danger, but one before which all the surgical world up to that time had recoiled. No one had studied the effect on the remaining kidney and upon the heart. No one had carefully determined what was the best method of reaching the kidney—whether through the abdomen or through the loin from the back; what to do with adhesions and many other technical questions. All these had to be settled. Accordingly he experimented on a number of dogs; decided that from these indications a human being could live with only one kidney; studied on the cadaver the best way of doing the operation, and on 2 Aug. 1869, removed this healthy kidney through the loin and saved the patient's life and made her perfectly comfortable. She died in 1877, after eight years of healthy life.

As I have said these new experiments laid the foundation of the modern surgery of the kidney have been opened; scores of stones have removed successfully. Finding this operation so feasible, surgeons were led to practise other operations; some hundreds of abscesses in the kidney have been opened; scores of stones have

been removed from the kidneys; floating (that is, loose) kidney has been sewed fast in hundreds of cases; many cases of tuberculosis of the kidney have been relieved or cured; tumors of the kidney are successfully attacked; even the cut ureter has been spliced and stones removed from it. In a word, Simon's experiments on a few dogs opened to us a new domain in surgery which until then was wholly unknown. Would it not be gross cruelty to man to prevent such beneficent researches?

The Stomach.—Until 1875 practically there was no surgery of the stomach. As occasional Cæsarcan sections have been done in the past, so occasional operations on the stomach were done when the surgeon was obliged to do them. Now, however, it is a matter of routine procedure, to the vast benefit of the human race. Had vivisection contributed nothing else to the progress of surgery than its services in the surgery of the stomach, this alone would be sufficient to justify it. I may quote from the Cartwright lectures* which I gave before the College of Physicians and Surgeons in New York in 1898:

"In 1875 Tschertneisky-Barischewsky cut out a piece of the intestines in 35 dogs, with 29 recoveries—a startling result when compared with the former fatality of such operations. This was the starting point in the new gastrointestinal surgery. The next year Gussenbauer and Winiwarter cut out a piece of the stomach in only seven dogs. We scarcely can appreciate at this day, though these experiments are so recent, how many new questions had to be answered. After their first unsuccessful experiment they naively remark that certain facts were established by the experiment, among them, 'that the surfaces of the stomach have a real tendency toward union by first intention, . . . just as do wounds of the skin.' (1) Whether this would be correct of man as well as of animals they admitted was as yet uncertain. Another point settled by the experiment was 'that there was no digestion of the mucous membrane in the neighborhood of the wound.' Their second experiment was followed by recovery, and showed not only that such an operation could be successfully done, but that the narrowing caused by the scar did not interfere with the functions of the stomach, either as to its movement or its secretion of the digestive juices, and that the removal of the pylorus was not followed either by the too early escape of the food into the intestines; or by the reflux of the intestinal contents into the stomach. The dog was killed five months later and the post-mortem showed no contraction by reason of the scar, and no digestion of the edges, and his perfect health after the operation showed that the movements of the stomach and its digestive functions had not been interfered with. Then, again, the question whether catgut or other suture material was the best, and what kind of a knot and what kind of a suture would best answer were subjects of debate. . . .

"Our anti-vivisection friends, who so often declare that experiments upon animals have never contributed anything to the progress of surgical science, may well be challenged to account for the remarkable progress in the surgery of the stomach which immediately followed these

* In quoting this I have popularised some of the medical terms there used.

VIVISECTION

fruitful experiments. The dogs that died did not die in vain. They showed the correct methods and indicated errors in technic, and directly led up to the modern surgery of the stomach and the intestine in man, as follows: In the very same year, 1876, Hueter cut out a part of the bowel, though without success. In 1877 Czerny for the first time sewed up the intestine and dropped it into the abdominal cavity, with recovery; followed almost immediately by Billroth, who did the first successful suture of the stomach and total removal of a portion of the bowel. In 1878 Forelli operated for a wound of the stomach, and in 1879 Cavazzani removed a portion of the stomach for tumor. In the same year Péan did the first removal of the pylorus. In 1880 Rydygier did the second, and in 1881 Billroth did the third and first successful one, without a knowledge of the preceding operations.²

Then followed various operations on the stomach to which I will allude later, and finally the successful removal of the entire stomach. It is quite impossible to give the details of all the various operations now done on the stomach and indicate minutely the part that vivisection has had in developing this extraordinarily successful branch of modern surgery. Suffice it to say that among them are the following, all of which owe more to vivisection experiments than to any other single agency:

In cancer of the oesophagus, or in the constriction of the oesophagus which so often follows the accidental or intentional swallowing of lye or acids, etc., so that no food can get into the stomach, we now open the abdomen, open the stomach, introduce a tube or construct a passageway into the stomach, and feed the patient through this outside oesophagus, as it were. In case the narrowing of the oesophagus is not from cancer the patient can live his natural span of life. In case of cancer his remaining days are rendered relatively comfortable, since the operation prevents his starving to death. When we have cancer at the opposite end of the stomach (the pylorus), so that the food, though it can be swallowed, cannot get out of the stomach, one of two courses is followed, both of which have been carefully studied in the lower animals and then adapted to man. First, the portion of the stomach and bowel involved in the cancer is cut out and the bowel united to the stomach directly, or, in other cases, an opening is made in the stomach and one in the bowel lower down, and the two openings are sewed together, thus allowing the food to pass from the stomach directly into the bowel beyond the cancer. The mere question of how the stomach and bowel shall be most successfully united in these cases, particularly the best method to prevent fatal leakage, has required very many series of experiments, especially in this country, by Serni, Abbe, Brockaw, Ashton, Murphy, and others. As a result of their labors sometimes we have learned how *not* to do the operation because of unexpected difficulties; sometimes how to better our procedure, until now we are in possession of satisfactory methods, as has been proved by the successful operation on man many times over. Even the sewing together of the stomach and bowel alone had been done up to 1898 in 550 cases which

have been published. I have no doubt that since then this number has almost been doubled. The mortality of this operation from 1881 to 1885 was 65.71 per cent; from 1886-1890, the mortality had fallen to 46.47 per cent; from 1891 it had again fallen to 33.91 per cent, and recently in 27 cases an Italian surgeon (Carle) has had a mortality of only 7.4 per cent.

Moreover, the experiments on animals having shown how safe various operations are, have emboldened us to enlarge the sphere of our operations and do others that were before not dreamed of—a good instance of the partly indirect good results from vivisection. A brief enumeration of some of the various operations done upon the stomach, together with their mortality, is as follows:

1. Where the stomach is bound down by adhesions (which often produce the most serious digestive disturbances, destroying comfort and even threatening life), we now open the abdomen, cut or tear the adhesions, and practically all of the patients recover.

2. Where there are foreign bodies in the stomach (or in some cases foreign bodies that have stuck in the oesophagus low down near the stomach), we open the stomach, remove the foreign body (often inserting the arm to reach it in the oesophagus), sew up the stomach and the abdominal wall, and the patients generally recover. In some cases as many as 198 staples, buttons, screws, horseshoe nails, etc., weighing over a pound and a half, have been removed, and the patients have recovered.

3. Where the oesophagus has been narrowed by the swallowing of lye, etc., instead of making a permanent opening in the stomach (as before described), sometimes by having the patient swallow a perforated shot which will carry a string down into the stomach, we can open the stomach temporarily, seize and draw out the shot, attach a conical dilator to the string, and, after having dilated the constriction of the oesophagus, remove the string, sew up the stomach and the abdominal wall and cure the patient permanently.

4. We now open the stomach purely to explore it and find out whether or not there is serious disease. This has enabled us in many cases to relieve illness which otherwise was incurable. Nearly all of these patients recover from the operation.

5. The permanent opening in the stomach through which we can feed a patient I have already described. It was first proposed in 1837. It was first done in 1849. From then until 1875 28 cases were operated on, with 28 deaths! It seemed almost as though the operation must be abandoned when, in 1875, the first operative recovery occurred. From then until 1884, in 163 cases there were 133 deaths—a mortality of 81.66 per cent. At the present time the mortality is only about 25 per cent in cases of cancer, and in the non-cancerous cases not over 10 per cent.

6. As I have indicated, in certain conditions we make an opening in the stomach and another in the bowel and sew the two together. In some cases of ulcer of the stomach, which cannot be cured by medical means, this gives wonderful results, both as to comfort and cure. The operation was first done in 1881, with a mortality

decreasing from 65.71 to 33.91 per cent in general, and in the statistics of single surgeons to only 7.4 per cent.

7. The first removal of the pylorus followed by uniting the bowel and the stomach was done in 1879. The mortality was very great, and still is large, ranging from 27.2 per cent in simple cases to 72.7 per cent when there are extensive adhesions.

8. When the pylorus is simply narrowed, but is not the seat of cancer, we make an incision in its long axis, seize the edges of the incision at the middle, draw them out at right angles to the line of the incision, and by sewing them in this position we widen the opening of the pylorus. This was first done in 1886. Up to 1894 the mortality was 20.7 per cent. Recently Carle has reported 14 cases, with a mortality of only 7 per cent.

9. In not a few disorders the stomach is dilated to nearly two or three times its normal size. In these cases we now take a "tuck" in it, as was first done in 1891. In 15 such operations only one death had occurred.

10. When the stomach, instead of being dilated, is displaced, we sew it fast, and practically in all cases recovery follows.

11. Sometimes the stomach is divided into two parts, like a dumb-bell with a very short handle. The first operation for relieving this condition was done in 1893 by making an opening in each half of the stomach and sewing the two openings together. Over 40 operations have been done for this condition, with only nine deaths.

12. Tumors of the stomach other than cancer are rare, but since 1887 at least seven cases of tumor have been cut out, of which six have recovered.

13. Partial removal of the stomach finally led to its complete removal, of which over a dozen instances have been reported, with a recovery of somewhat more than half. Nearly all, however, have died from recurrence.

Some of the above operations are not the direct result of experiment upon animals (as, for instance the taking of a tuck in the stomach); but they are the indirect result, first, through the antiseptic method, which itself is the child of vivisection, and, secondly, because through our experience in other operations we have been led to perform totally new ones. It is the same in other sciences. If we were still dependent upon the old "air-pump" worked by hand we should have no lighting by the incandescent bulb of to-day, for this is dependent upon a cheap method of making an almost complete vacuum. This is a wholly unexpected and indirect result of improvement in air-pumps as one of the chief factors of progress.

The Intestines.—Very much the same story can be told of the surgery of the bowel. Indeed, the surgery of the stomach involves largely that of the bowel. I need, therefore, only recall a very few points. When a tumor or cancer exists in the bowel, of course, in a little while it obstructs the passage of the intestinal contents; and if this obstruction becomes complete and is not quickly removed the patient must necessarily die. As a result of many experiments upon animals (more especially by Senn, Parkes, and other American surgeons) we now know how

to deal with this condition. First, if the tumor or cancer can be removed it is cut out entirely, and the two ends of the bowel are united. Our present successful means of uniting them are a result of most laborious researches by experimentation upon animals to discover the best method of doing this otherwise perilous operation. The slightest leakage of intestinal contents produces a fatal peritonitis. Where the cancer cannot be removed, in order to prolong the patient's life and lessen his terrible pangs we make an opening above the obstruction and another one below and sew the two openings together. Here again many experiments were needed to determine whether an animal could live with the intestinal contents thus "side-tracked," and, if life could be maintained, what was the best method of doing the operation.

In gunshot wounds of the intestines, which formerly were among the most fatal of all accidents, we now can rescue a very large percentage of the patients. During the Civil War practically almost every case of perforation of the intestine by gunshot died. To see whether something could not be done to remedy this frightful mortality Gross many years ago performed some experiments to determine the best treatment of such wounds. Later Parkes etherized a number of dogs, shot them, opened the abdomen and treated the wounds in various ways; and in consequence of this and other series of experiments, at the present time many instances of recovery have been reported in which multiple wounds even to the number of 17 have been found, closed by methods determined by vivisection to be the best, and the patients have recovered. To reach this result it had to be determined by accurate observation on animals what was the best method of closing such wounds; what material is the best for use as a thread; under what conditions it would be needful, instead of closing the wound, to cut out the injured portion of the bowel and unite the two ends; how long after perforation occurred was the best time to operate, and many other such questions too technical to mention here.

In typhoid fever and in ulcer of the stomach also sometimes a perforation similar to the hole made by a bullet occurs, and the contents of the intestines or of the stomach are poured out into the abdominal cavity. Of course, every one knows that if this went on for a brief time death would necessarily follow. In the lower animals we cannot produce exactly the conditions following perforating ulcer of the stomach and perforations such as occur in typhoid fever; but, in consequence of the knowledge acquired by experimenting upon gunshot and incised wounds of the stomach and bowel in the lower animals, we finally woke up to the fact in 1884 that a perforation after such an ulcer, either in the stomach or in the bowel from typhoid fever, ought to be closed. In 156 cases of such perforation of the stomach operation has been done, and the recoveries have been 46.80 per cent. But in the last 54 of these operations done from 1896 to 1898 the percentage of recoveries has risen to 64.82 per cent. In 362 such operations done for perforation of the bowel in typhoid fever up to 1904 the recovery rate was 25.97 per cent. Some individual surgeons have saved one in three, and ultimately, I believe, one half of such patients will be saved. It must be remembered

VIVISECTION

that in such perforations of the stomach and bowel *every patient* would die were no operation done. To save one half or even one third is a surgical triumph.

I have several times alluded to cutting out a portion of the bowel and uniting the two ends. This involves a number of problems which ought not, and, in fact, cannot, be studied in man because of the fact that it is wholly inadmissible to test such operations (which always involve life) on man when they can be tested accurately and more quickly by experiments on animals and without involving human life.

I have stated that by many experiments on animals we have now reached a satisfactory solution of the problem how the two ends of the bowel are best sewed together. But one other question was still unanswered—how much of the bowel could be removed and yet life be preserved. A similar question, we have seen, has been answered in respect to how much of the liver could be removed by Ponick's experiments. How much of the bowel could be removed was a most important question. We would all presume that a few inches, possibly even a foot or two, might be removed without danger; but when we remove a larger portion we cut down the digesting and absorbing surface to such an extent that it is a question whether the patient can still live. This has been determined upon animals, and then, as occasion required us to decide the question, in man. As a result of the knowledge derived from animal experimentation I saw a few years ago in Montreal a man from whom Shepherd had removed over one third of the entire length of the bowel (eight feet) which was involved in a large tumor; and yet the patient was in capital health for a long time after the operation.

Hydrophobia.—The search for the germ of this dreadful disease has as yet been fruitless; but happily the search for the means of prevention has been crowned with success. Of every 100 persons bitten about 15 contracted hydrophobia, and of those bitten on the head and face at least 80 per cent die of hydrophobia. Up to the time of Pasteur *every* person who contracted hydrophobia died, that is, the mortality was 100 per cent. The Pasteur treatment, which is entirely the result of animal experimentation, by preventing its occurrence, has reduced the mortality to less than 1 per cent of the persons bitten. And yet the establishment of Pasteur Institutes for the benefit of the human race has been resisted most strenuously by those opposed to vivisection.

Transplantation of Bone.—In 1867 Ollier a celebrated French surgeon who recently died, by experiments on animals showed that the membrane which covers the bones (the periosteum) could be peeled off a bone and transplanted to a distance into the tissues of the same animal, or even of another animal, and that it would there live and produce new bone. These experiments, very crudely described in these few words, have been extraordinarily fruitful in several directions.

First, in certain cases it is necessary to remove diseased or dead bone. These experiments showed us that if in removing the bone the periosteum was carefully guarded and left behind it would reproduce the bone. In some cases in which the lower jawbone has died as a result

of phosphorus poison in the employees of phosphorus match factories, the dead bone has been removed, but the periosteum has been preserved and a new jawbone has been reproduced. Another result has been that, instead of amputating, for example, an arm when the elbow is diseased, we can remove the bone and by preserving the periosteum can preserve a more or less useful joint.

In other cases a certain area of bone, as for instance, in the skull, is chiseled loose or otherwise separated from the surrounding bone excepting for an inch or two at the portion where the chief blood supply enters the flap. The bone is then forcibly broken at this unchiseled portion and turned back, the periosteum and scalp acting as a hinge. When the tumor has been removed, the abscess opened, or other needful operation done, the trap door is simply closed by replacing the flap, the scalp sewed in place and the integrity of the skull is restored. One can see that this is an immense advantage over having a great hole left in the side of one's skull.

In some cases, in which, in consequence of accident or abscess, a large hole already exists in the skull, we either chisel off bits of adjacent bone or replace the bone by a plate of celluloid and successfully fill this opening.

Again, in certain cases, for example, in which the jaw has been fractured, a bit of the bone has been chiseled loose from the patient's jaw and has been grafted in place as a bridge between the two fragments, so relieving the deformity or remedying an otherwise incurable fracture.

Again, a certain small number of children are born without any bone at the back of the spine in the neck or the loin (*spina bifida*). Through this opening the membranes of the spinal cord protrude and form a tumor which, if untreated, in most cases proves fatal. We now operate most successfully on most of these cases, and in suitable cases either chisel loose a bit of adjacent bone and transplant it, so as to close the opening, or in other cases take a bit of bone from one of the lower animals to fill the opening and cure the patient.

Again, in certain cases of fracture of the arm bone (humerus) the nerve going to the muscles on the back of the forearm, which winds close around the bone in a spiral, is torn in two; these muscles are paralyzed, and the patient has what we term "wrist drop," so that the hand is useless. In such cases the knowledge derived from two different series of experiments comes to our aid to enable us to remedy the trouble. First we find the two ends of the broken nerve, freshen these ends, unite them, and in many cases can change a useless hand into a useful one; but if so much of the nerve has been destroyed that the two ends cannot be brought together we now deliberately remove an inch or two of the arm bone, thus shortening the arm enough to bring the two ends of the nerve in contact and sew them together, and in a good percentage of cases we can again restore the hand to usefulness after months and occasionally even after years.

A still more remarkable transplantation of the bone is accomplished in some operations on the skull. In some cases it is necessary to remove a button of bone which may be an inch and a half or two inches in diameter in order

VIVISECTION

to do an operation on the brain. The operation which has necessitated this removal of bone may require an hour and a half or two hours. If we want to replace the bone so as not to leave an opening in the skull through which the brain may easily be dangerously injured we put the bone in a basin of hot salt solution or weak antiseptic solution, and by keeping it at a proper temperature, at the end of the operation, when it has been totally detached from the body for so long a time, we replace it and its vitality is not lost.

All of these various operations (and others which I have not time to describe) done on bone, to the immense advantage of our patients, are the direct or remote results of the experiments of Ollier and others on the transplantation of periosteum and of bone in animals. The indirect results are quite as valuable, and sometimes more valuable, than the direct results of such experiments.

An illustration of the indirect results of Ollier's experiments is shown in the transplantation of the skin. One of the oldest operations in surgery is the making of a new nose. When the nose has been lost a suitably shaped flap was cut on the forehead, leaving a sufficient uncut base for a proper blood supply so that the flap would not undergo gangrene. The flap was then turned by twisting it on its base and was sewed in place where the nose had been. The experiments of Ollier and his successors showed, however, that periosteum, and even so dense a structure as bone, could be entirely detached from the body for a long time and yet not lose its vitality. Hence we now transplant bone as well as skin to make firm instead of flabby noses. This has led us of late years to apply the same procedure to the skin, and enables us now to do far more extensive and more successful operations than would otherwise have been possible. The first method tried in man was that of Réverdin, of Geneva. He cut little bits of skin only as big as a pin's head from the arm or the thigh, not quite skin deep, and planted them on any raw surface which did not heal readily. These grafts under proper treatment adhere and form new centres from which healing of the wound takes place. Emboldened by this, Krause and other surgeons have taken very large pieces of skin, including often the whole thickness of the skin, and transplanted them. For example, in some cases of extensive cancer in which a very large portion of skin must be removed, now, while the patient is under the influence of the anæsthetic, we take strips of skin an inch wide and several inches long from the thigh, or, in other cases, from another person who is willing to give up a portion of his skin. These pieces are immediately placed on the raw place left by the removal of the tumor, and as they do not lose their vitality but grow fast to the tissues under them, the wound is healed almost immediately, instead of taking a long time for the slow formation of a scar.

One of the most difficult of all wounds to heal is an extensive burn, such as is produced by the clothing catching fire. In these cases large surfaces of the skin on the chest or the abdomen slough off, resulting in great ulcers. These sometimes take months, sometimes years, to heal, and in not a few cases never heal, no matter what is done. Now, as a result of our ex-

perience, first with the periosteum and bone and then with small bits and then larger bits of skin, we transplant strips of skin as just described, and heal such wounds in a very short time. One sees in the newspapers every now and then accounts of some woman whose long hair has been caught in machinery and almost all of the scalp torn away. These wounds are healed by transplanting skin in a similar manner.

The Blood.—We are at present only just beginning to appreciate how much we can learn from examination of the blood, especially by new methods lately introduced. Almost every intelligent person knows that the blood consists, roughly speaking, of a fluid in which float small circular disks, about $\frac{1}{100}$ part of an inch in diameter, called the red blood cells. In addition to these there is in the blood another kind of cell called the white blood cell. The red blood cells are made up chiefly of a substance called hemoglobin, which gives the color to the blood. Some of the investigations, which are really only at present at the beginning of their usefulness, are as follows. They are good illustrations of how inductive science begins by ascertaining facts. If they are valueless they are disregarded; if of value they are studied still further. It is not unlikely that the blood may soon be one of the most fruitful sources of the knowledge by which surgery may profit greatly:

First, the number of white blood cells. It is found that in case inflammation results in an abscess the number of white blood cells is increased several times. Ordinarily in a little cube of blood one millimetre (the twenty-fifth part of an inch) on each of its sides the number of red blood cells is about 4,000,000 to 5,000,000, and the number of white blood cells is 8,000 to 10,000.

If one has an abscess, the white blood cells as a rule will rise to 15,000, 20,000, 25,000 or more to the cubic millimetre—a condition that we know scientifically as "leucocytosis." In certain cases when it is a question whether an abscess exists (as, for instance, in the brain, in the liver, and other parts of the body in which the diagnosis is very difficult to make) if the leucocytosis or its absence will show us absolutely that there is or is not an abscess present, it would be of the greatest help.

Again, in typhoid fever the pain and tenderness exist just above the right groin. In appendicitis the pain and tenderness exist in the same region, and in not a few cases it is extremely difficult to distinguish between these two diseases. Especially is this true at the beginning of such an illness, just when it is most important to make the right diagnosis and institute the correct treatment. If the presence of leucocytosis will show us distinctly that it is appendicitis, and the absence of leucocytosis that it is typhoid fever, an immense gain in accuracy of diagnosis, and, therefore, of the proper treatment, will result. To open the abdomen, if it is typhoid fever (without perforation), would be a dreadful mistake; not to open it, if it is appendicitis, would be, as a rule, equally wrong treatment. If the leucocytosis is a sure guide we cannot learn it too quickly. It seems very reasonable, therefore, that experiments should be made in the lower animals by producing abscesses and determining whether under many varying conditions leucocytosis is always present

VIVISECTION

when there is an abscess and always absent when there is no abscess.

Second, the hemoglobin, which makes up the bulk of the red blood cells, is the means by which oxygen is carried to all parts of the tissues. Whenever an anesthetic, such as ether or chloroform, is given, the amount of hemoglobin is distinctly diminished, and by this means the oxygenation of the blood is hindered. In certain conditions of the system the percentage of hemoglobin is diminished to 60, 50 or even as low as 25 per cent of the normal. If an anesthetic is given to a person with an already diminished percentage of hemoglobin this percentage is still further diminished, and the oxygenation of the blood still further hindered. If, then, the percentage of hemoglobin is very small before an operation the danger of giving an anesthetic is very marked; if the hemoglobin is as low as 30 per cent it is very likely that the patient may die upon the table irrespective of the operation, simply because the anesthetic reduces the hemoglobin to such a point that the blood does not absorb enough oxygen to carry on life. Some authorities have stated that we ought never to give ether or chloroform to a patient whose hemoglobin is below 50 per cent. Others have placed the limit as low as 30 per cent. Surely this subject which is very recent and about which we know up to this time very little, ought to be investigated with the greatest care in animals rather than to decide the question by sacrificing life by venturing to give an anesthetic to patients whose hemoglobin is at so low a point as to be inconsistent with safety.

Other recent researches are those on the temperature at which the blood freezes and the lapse of time after the blood is drawn from the body before it coagulates—that is, clots. A small portion of blood drawn by a prick of the finger enables us to determine these four conditions—that is, (1) the presence or absence and the degree of leucocytosis; (2) the percentage of hemoglobin; (3) the freezing temperature of the blood, and (4) the coagulation time of the blood. We are beginning to see that these last two as well as the first two will probably prove of the greatest value in reference to surgical operations. Hence we ought to learn accurately and quickly all the facts in the case by experiments upon animals, and so avoid dangers to human life, of which until lately we have been quite ignorant.

These would include experiments upon animals fasting, or after feeding; after being bled; after surgical operations have been done upon them; after an anesthetic is given to them; when the anesthetic is administered for a short time, for a longer time, for a very long time, or for a time long enough to kill them, in order to determine what the effect of the anesthetic is in fatal and non-fatal doses. It is of the utmost importance that we should know exactly and speedily the result of all these conditions. If we are debarred from learning them by experiment on animals, then the human race must go without the knowledge we seek, saving as it is revealed to us from time to time by studying slowly and inexactly the results in man. With certain modifications due to the slight differences between man and animals the conclusions drawn from experiments on animals apply to man.

Let me give one instance which confronts

the surgeon not infrequently. An abdominal section is occasionally followed by very great and, it may be, dangerous and alarming depression. One of the most difficult things to determine in some cases is whether this condition is due to the shock of the operation or to internal hemorrhage. Thus hemorrhage differs from that which may follow an amputation or removal of a tumor from the neck, etc., by the fact that it is concealed within the abdomen, and its existence can only be inferred. If the patient is suffering from shock, stimulation, heat, quiet, certain drugs, etc., will be resorted to to enable him to recover. If it is due to internal hemorrhage, we must instantly reopen the abdomen and tie the bleeding vessel. To do the latter operation when the patient is only suffering from shock might prove fatal; not to do it, if hemorrhage is the cause of the depression, is certainly fatal. No one not a surgeon can appreciate the anxiety, the careful weighing of evidence, the intense longing for some positive means by which a correct diagnosis may always and surely be made, which every surgeon feels in such an emergency.

It is possible that by examining into the presence or absence of leucocytosis, by determining the percentage of the hemoglobin, or possibly even the coagulation time and the freezing temperature of the blood in a number of operations in human beings, we might be able positively to determine the difference between shock and internal hemorrhage, but only after making many blunders, each of which would cost a human life. In an animal we can open a blood-vessel in the abdomen and let it bleed for a longer or shorter time, and determine positively the leucocytosis, the hemoglobin, etc., the animal meantime suffering nothing because it would be under an anesthetic. Which is the right, which the kindest, which the most humane way of finding out the truth? This is an illustration of the painlessness to animals of such experiments and their priceless value to human beings.

Experiments to Enable us to Make a Reliable and Speedy Diagnosis.—In some cases in which the diagnosis is difficult, or may require considerable time, experiment upon animals aids us greatly, and so is of immense value to man. Thus in supposed anthrax, or wool-sorter's disease, a most dangerous malady, by inoculating a guinea pig with the discharge the diagnosis can be cleared up quickly and proper treatment instituted. If a case suspected to be one of bubonic plague arises the diagnosis can be established within 24 or 36 hours by a similar injection into a rat or a guinea pig, the apprehensions of a community (to say nothing of the patient and his friends) relieved and the greatest damage to its commerce averted by discovering that it is not the dreaded pestilence, or, if it is the plague, by showing the necessity for most stringent measures of prevention. I do not think any community will or ought to allow sympathy with the unavoidable suffering of a few rats or guinea pigs to weigh in the balance against the safety of many human lives or the ruin of large business interests.

An amusing instance of how sentiment gives way before affection and facts occurred not long since in England. The brother of the Duke of Newcastle was bitten by a dog supposed

VIZAGAPATAM — VIZCAINO

to be rabid. The duke was a vice-president of the Anti-Vivisection Society, but knowing that whether the dog was rabid or not (and, therefore, whether his brother was in danger or not) could only be settled by inoculation experiments upon animals, he took the dog to Mr. Horsley, in London, and had the experiment done—and promptly was compelled to resign his office in the society.

By similar means anthrax and actinomycosis (or lumpy jaw, which spreads to man as well as to herds) among cattle are diagnosed and eradicated; glanders in horses is recognized and stamped out and tuberculosis in cows is eradicated, not only preventing its spread to healthy cattle, but through the milk to many human beings, especially young children, whose chief diet must be milk.

By similar experiments on animals chicken cholera, hog cholera, Texas fever, cattle plague, and many other diseases of cattle, sheep, horses, hogs, poultry, and other animals have had their causes discovered and the means of prevention or of cure demonstrated. The reports of the Bureau of Animal Industry at Washington enter into these in detail. Surely the poor animals which have benefited so greatly from such experiments should pray to be saved from their friends if these beneficent researches are to be prohibited.

I often wonder what would have been the influence on surgery if the young man who first took ether in the Massachusetts General Hospital on 16 Oct. 1846, had died. Morton, it is true, had experimented on some dogs first, but, as we now view it, very inadequately. Had this patient died, would not the use of ether have been deferred for years, possibly even till now, and meantime the human race all over the world have gone on suffering the horrible tortures of the pre-anesthetic days and all our modern progress in surgery have been prevented?

If the sacrifice of the lives of even a considerable number of animals enables us to reach the benevolent purposes a few of which I have described, is it not plainly a moral duty to perform them so as to obtain this knowledge? Is it not wrong to hinder such benevolent researches? Especially is it not wrong so to hinder research when, in the vast majority of instances, animals suffer little or nothing? In almost all experiments not only can an anesthetic be used, but in all involving difficult and delicate operations it is essential to do so; for it is impossible to do such an operation on an animal struggling from pain. Not only, therefore, does sentiment lead the vivisectionist to spare the animal all the suffering that is possible, but scientific accuracy points in the same direction. A very few experiments, principally those on the nervous system which require us to determine the presence or absence of sensation, cannot be done with an anesthetic; but these experiments are few and far between. Some experiments also (for instance, those on lockjaw, to which I have already alluded) by producing the disease, necessarily make the animal suffer; but if by the suffering of a few animals, human beings suffering from lockjaw can be cured, or, still better, if we can learn the cause of the disease and so can prevent it from attacking human beings, is it not worth the suffering? The infliction of suffering is not cruelty. If one dear to us meets

with an accident far away from surgical aid and we spur a horse to the utmost, so that finally it drops dead in the frantic effort to bring surgical assistance, I am sure no one would accuse us of cruelty, although we had inflicted torture upon the horse. So this infliction of pain on a small percentage of animals experimented on is not cruelty, but is the greatest kindness to other animals and to a much higher animal—man himself.

I have been able in this paper only to select a few illustrations of the progress that surgery has made by experimentation on animals. Practically, as I said at the beginning, nearly all of these have occurred during my own professional life, and I speak, therefore, of what I know. Although I myself am not a vivisectionist, yet I could not do the work I do every day and accomplish results I do were it not for just such work, of which I take advantage. In view of these facts, therefore, how unwise it would be to restrict and still more to abolish such life-giving and pain-saving results of vivisection, especially when the animals themselves benefit from these experiments almost as much as man. I have not referred to any of the older experiments, such as those remarkable experiments of Jones on the methods of tying blood-vessels in the early part of the last century, nor of Sir Charles Bell's experiments by which he determined the functions of the two different roots of the nerves just as they emerge from the spinal cord, nor of the circulation of the blood as discovered by Harvey. All these are fundamental; and without the knowledge derived from them we should be a century or more behind where we are now. I have preferred rather to take modern instances with which I am personally familiar in order to illustrate the subject which I have been asked to describe. I cannot believe that any unprejudiced, fair-minded reader will not agree with me that such humane purposes should be fostered and not hindered; should be encouraged and not abolished.

W. W. KREN, M.D.,

Professor of Surgery, Jefferson Medical College, Philadelphia.

Vizagapatam, vē-zā'gā-pā-tām', India, a town, capital of a district of the same name, in the Madras Presidency, at the entrance of the Veragatam into the Bay of Bengal, about 180 miles northeast of Masulipatam. It is a military station and has a good harbor, a modern water supply, sanitary system, hemp manufactures, and an export trade in rice and sugar. Pop. about 50,000.

Vizcaino, vēth-kā-ē'nō, Sebastián, Spanish navigator: b. Huelva, about 1550; d. Acapulco, Mexico, about 1615. After being prominent in Mexico he headed exploring expeditions from Acapulco to Lower California, 1596-7, and in 1602-3 along the California coast to latitude 43°, discovering the bay which he called Monterey, and sent a vessel which appears to have reached the mouth of the Columbia. He also sailed to Manila and Japan, 1611-14, carrying Franciscan missionaries to Japan, and was the earliest to attempt to establish commercial relations between Spain and Japan. His reports of his voyages to California were printed in Torquemada's 'Monarquía Indiana' (1615), and the greater share of his narratives, including that of

VIZETELLY — VIZIER

his voyage to Manila, was included in De Navarrete's 'Coleccion de Viajes y Descubrimientos' (1625-9).

Vizetelly, viz-è-tèl', Edward Henry (**BERTIE CLARE**), English journalist and was correspondent, son of H. R. Vizetelly (q.v.): b. Chiswick, England, 1 Jan. 1847; d. London 13 April 1903. He was educated at the Imperial Lyceum, Saint Omer, France. At the outbreak of the Franco-Prussian war he became special correspondent for the *New York Times* and the *London Daily News*, served as orderly officer on the staff of Garibaldi, and was present at Dijon and at Langres; subsequently he engaged in the Kabyle insurrection of 1871, served in the Russo-Turkish war of 1877-8 and in the Greek insurrection of the latter year. He founded the *Cyprus Times* in 1881 and the *Times of Egypt* at Alexandria in 1882. At the bombardment of Alexandria on 11-12 July 1882 he was the only Englishman in the city, and during the firing sent half-hourly despatches to London. In 1888 he commanded the *New York Herald* relief expedition sent in search of Stanley in Africa, and met him in East Africa in 1889. He was the author of 'Reminiscences of Bashi Bazouk'; 'From Cyprus to Zanzibar'; 'The Warrior Woman'.

Vizetelly, Ernest Alfred, English journalist and editor, son of H. R. Vizetelly (q.v.): b. London 29 Nov. 1853. He was completing his education in Paris when the Franco-Prussian war broke out and he became correspondent for the *Yorkshire Post*. After the close of the war he accompanied his father in the capacity of artist through Austria, Spain, Portugal, and Italy until 1886, when he joined the editorial staff of Vizetelly & Company. Subsequently he engaged in journalism, and has translated into English the greater part of Zola's works. As a novelist he has written 'The Scorpion' (1894); 'A Path of Thorns' (1901); and 'The Lovers' Progress' (1902). He edited an edition of 'The Hep-tameron, English Bibliophiles,' planned by his father (5 vols., 1894); his other publications include: 'The True Story of Chevalier d'Eon' (1895); 'Bluebeard, Comorre the Cursed, and Gilles de Rais' (1902); 'Emile Zola, a Biography' (1904).

Vizetelly, Francis (Frank) Horace, son of H. R. Vizetelly (q.v.), American editor and encyclopedist: b. London 2 April 1864. He was educated at the Lycée Baudard, Nogent-sur-Marne, France, and at Arnold College, Eastbourne, Sussex. From 1888 to 1891 he was engaged in business with his father at London, and in the latter year came to the United States. In 1891 joined the editorial staff of the 'Standard Dictionary,' for which he prepared the definitions on wines, and from the date of the publication of that work was the assistant of the editor-in-chief in all subsequent editions issued, revising the entire work for the edition of 1903, when he became associate editor. During 1893-4 he filled the position of associate editor of the 'Home and Country Magazine,' was revising editor of the 'Columbian Encyclopedia' in 1896, of the 'Cyclopedia of Classified Dates' in 1899, and also was one of the editors of Hoy's 'Cyclopedia of Practical Quotations.' He investigated in 1901 the conditions prevailing in the Boer detention camp at Bermuda, the only civilian accorded that privilege by the British authorities, and published his report in the leading Amer-

ican and English newspapers. He is secretary of the editorial board of the 'Jewish Encyclopedia' and manager of the editorial department of that undertaking. Among his writings are: 'The Story of the Wheel' (1898); 'The Fan in Romance and History' (1898); 'The History of the Glove' (1899); 'The Boer as a Prisoner of War' (1901); 'The Crime of the Congo' (1903); etc.

Vizetelly, Henry Richard, English newspaper proprietor, editor, publisher and writer; b. London 30 July 1820; d. Tilford, near Farnham, England, 1 Jan. 1894. He came of a family of printers and stationers, was educated at Clapham and at Chislehurst, and was later apprenticed to a wood-engraver, an art in which he became proficient, his most notable work as an engraver being a series of illustrations drawn by Birket Foster (q.v.) for Longfellow's 'Evangeline.' He took a prominent part in founding 'The Illustrated London News' in 1842, and was one of the founders of the 'Pictorial Times' in 1843, a pioneer enterprise in illustrated journalism, published the first English edition of 'Uncle Tom's Cabin' in 1853; established the 'Illustrated Times' in 1855; the 'Welcome Guest' in 1858; and in 1865-76 was correspondent of the 'Illustrated London News' at Paris and at Berlin. He was appointed representative of the British government on wines at the Vienna Exposition in 1873 and at Paris in 1878, and for his labors at the former was created by the Austrian emperor chevalier of the Order of Franz-Joseph of Austria. In 1880 he established a publishing house in London, and engaged in issuing translations of the works of foreign authors, chiefly Russian and French, and in 1884 began to publish translations of the works of Emile Zola. The literal translation of the works of the novels of the French realist, however, aroused a storm of protest, and in 1888 he was indicted on the charge of publishing obscene libels, and, on the advice of counsel, pleaded guilty and agreed to withdraw the edition of Zola's works. Thereupon he was fined £100 (\$500) and required to enter into his own recognizances to be of good behavior for a period of six months. In 1889, in harmony with his understanding of the undertaking given, he decided to issue an expurgated edition of the works of Zola. Notwithstanding the deletion of all the passages to which objection had been raised, he was indicted a second time, and, being then 71 and broken in health, he, following advice of counsel, again pleaded guilty, and was sentenced to three months' imprisonment as a first-class misdemeanant. His writings include: A series of monographs on wines, entitled 'Wines of the World' (1875); 'Facts about Sherry' (1876); 'Facts about Champagne' (1879); 'Facts about Port and Madeira' (1880); 'The Story of the Diamond Necklace' (2 vols., 1887); 'Berlin under the New Empire' (2 vols., 1879); 'Paris in Peril' (3 vols., 1882); and two volumes of literary reminiscences; 'Glances Back through Seventy Years' (1893); etc.

Vizier, vi-zēr, a title given to high political officers in the Turkish Empire and other Mohammedan states. In Turkey the title is given to the heads of the various ministerial departments into which the divan or ministerial council is divided. The president of the divan or prime minister is known as grand vizier.

VLADIKAVKAZ — VOGEL

Vladikavkaz, vlā-dē-kāv-kāz', Russia, a fortified town in Caucasus, capital of Terek district, situated on an elevated plane at the northern base of the Caucasus, about 90 miles north of Tiflis, with which it is connected by a military road through the Dariel gorge. It is connected by rail with Rostov and with Petrovsk on the Caspian, and is rapidly developing as a commercial centre.

Vladimir I., vlā'dī-mīr or vlā-dē'mīr, Saint, "the Great," Russian emperor, son of the Grand Duke Sviatoplav: d. Beresnyx, Russia, 1015. He received from his father in 972 the government of Novgorod, notwithstanding his illegitimacy, and the remainder of the empire was divided between the lawful heirs, Jaropalk and Oleg. Jaropalk killed Oleg in a quarrel in 977, and Vladimir escaped a similar fate only by flight. In 980 Vladimir returned with an army, overthrew and caused the assassination of Jaropalk, and became sole ruler of the empire. He then extended his boundaries from the Black Sea to the Baltic, and founded his capital at Kiev. While besieging the Christian city of Cherson in the Crimea he decided to demand the hand of Anna Romanovna, sister of Constantine IX., the Byzantine emperor, in return for a cessation of hostilities. The demand was granted, and by this princess Vladimir was converted to Christianity. The Greek Church was established in Russia, and Vladimir's subjects willingly embraced the new faith. The character of the emperor seems completely to have changed after his conversion. He built churches and monasteries, abolished capital punishment, and in his private life substituted chastity for the former licentiousness. He divided his empire among his 12 sons, and after his death was canonized in the Greek Church, while in 1782 the "Vladimir Order" was founded by Catharine II. Consult Karamzin, 'History of Russia' (1816).

Vladimir II. Monomachus, Russian emperor, great-grandson of Vladimir I.: b. 1052; d. Kiev, Russia, 19 May 1126. Contrary to the Slavonic law, he succeeded to the throne in 1113. He possessed both valor and ability, and under his wise rule Russia enjoyed a period of great prosperity. He married Gida, daughter of Harold of England, and the famous Valdemar of Denmark was his grandson. He wrote a "Testament," which is valuable as a picture of the manners and opinions of the day. Consult Rambeau, 'History of Russia' (1886).

Vladimir, Russia, (1) a town, capital of the government of same name, on a lofty and wooded bank above the Klyazma, 105 miles northeast of Moscow. It is one of the oldest towns in Russia; and has a 12th century cathedral, a theological seminary, considerable manufactures, and a trade in fruit, particularly cherries. From 1157 to 1238 it was the residence of the Russian grand princes. It was twice sacked in 1238 and 1410 by the Tartars. Pop., 28,315. (2) The government has an area of 18,864 square miles. It has an undulating surface with a general slope toward the east, and is not very fertile. The drainage is all carried to the Volga by the Oka and its tributary, the Klyazma. The province is rich in archaeological remains of the Paleolithic and subsequent ages. There are important manufactures of linens and woollens and several blast-furnaces.

Vladivostok, vlā-dē-vōs-tōk', Asiatic Russia, a fortified seaport town of Eastern Siberia, on the harbor of the Golden Horn in the Gulf of Peter the Great, Japan Sea. It was founded in 1861, and is an important naval station of Russia, and the eastern terminus of the Trans-Siberian Railway, the first sod of which was cut at Vladivostok, 24 May 1891, the line being opened in December 1901. The harbor is surrounded by hills which are well fortified. It has large dry docks, waterworks, electric street railways, and street lighting plants, two large shipbuilding yards, and 60 new mechanical shops. Vladivostok is an open port, and has lines of steamers running to Japanese and Korean ports and a line opened in 1900 to Seattle, Wash. Ice-breaking steamers keep the harbor open in the winter months. A Japanese squadron bombarded Vladivostok early during the Russo-Japanese war of 1904, but without inflicting any serious damage. Pop. about 38,000, including nearly 25,000 soldiers, and numerous Chinese, Japanese and Koreans. See TRANS-SIBERIAN RAILWAY.

Vodka, a Russian intoxicating liquor, distilled from rye, and much used by the peasants of Northern Europe.

Vogdes, Israel, American soldier: b. Wiliston, Pa., 4 Aug. 1816; d. New York 7 Dec. 1889. He was graduated at West Point, and served in Florida against the Seminole Indians in 1840-56. He was captured by the Confederates 9 Oct. 1861, while repelling their attack on Santa Rosa Island, Fla.; released in August 1862; and as brigadier-general of volunteers commanded Folly Island, S. C., in April-July, 1863. He was promoted colonel, U. S. A., 1 Aug. 1864; commanded the defenses at Portsmouth and Norfolk in 1864-5; was brevetted brigadier-general, U. S. A., in April of the year last named; and was retired at his own request in January 1881.

Vogel, fō'gēl, Eduard, German explorer: b. Crefeld, Prussia, 7 March 1829; d. Wara, Wadai, 8 Feb. 1856. He was educated at Leipzig and at Berlin, making a special study of astronomy and natural science. In 1851-3 he assisted Hind at Bishop's Observatory in London, and in the latter year was selected by the English government to conduct an expedition to join that of Clapperton, Barth, and Overweg in Central Africa. He sailed from England 20 Feb. 1853, and on 13 Jan. 1854 reached Kuka, the capital of Bornu. From this point he made several expeditions into the surrounding country, and on 1 Dec. 1854 met Barth near Zinder. He penetrated south to Yacobi and the Benue, and on 1 Dec. 1855 returned to Kuku. From this time his notes of his explorations cease, but subsequent information discloses that he set out to the east on 1 Jan. 1856, reached Wara in Wadai, and was there assassinated. For his notes consult 'Erinnerungen an einen Verschollenen,' by his sister, Elise Polko (1863); also Pahde, 'Der Afrikaforscher Eduard Vogel' (1889).

Vogel, Hermann Wilhelm, German photochemist and spectrum-analyst: b. Dobrilugk, Lower Lusatia, Prussia, 26 March 1834; d. Berlin 17 Dec. 1898. He studied at the Royal Industrial Institute of Berlin, in 1860-5, was an assistant in the mineralogical museum of the University of Berlin, and from 1884 was director of the photo-technical laboratory of the

VOGEL—VOICE AND VOICE CULTURE

Technical Institute there. He twice visited the United States (1870, 1883). His studies were directed in particular to the processes of photochemistry, the absorption-spectrum, and the spectra of oxygen, nitrogen, and hydrogen. His silver-tester, photometer for pigment-printing and heliotype-printing, and universal spectro-scope were introduced into general use. Among his writings was a 'Handbuch der Photographie' (4 ed. 1890-4).

Vogel, Sir Julius, Australasian statesman: b. London 24 Feb. 1835; d. near there 12 March 1899. He was educated at the London University College School and at the Royal School of Mines, and in 1851, attracted by the discoveries of gold in Australia, went to Melbourne. He engaged in journalism, and in 1861 established in Otago, New Zealand, the *Daily Times*, the first and still the leading morning newspaper in that colony. In 1863 he entered the New Zealand House of Representatives and in 1869 he was appointed colonial treasurer, and subsequently was postmaster-general, commissioner of customs, and prime minister. He resigned the latter office in 1876 and was agent-general for New Zealand in London in 1876-81. In 1884 he re-entered New Zealand politics, was elected to Parliament and again appointed treasurer, but in 1888 resigned and returned to England. He was afterward engaged under the New Zealand government in London until his death. He greatly furthered immigration to New Zealand, was instrumental in building railways, was active in bringing about the Australasian federation, and secured the passage of a law for inscribing colonial stocks. He was knighted in 1875. His writings include: 'Great Britain and Her Colonies' (1865); 'Official Handbook of New Zealand' (1875); 'A. D. 2000,' a novel; etc.

Vogelwulde, fô'gêl-vî-dê, Walther von der. See WALTHER VON DER VOGELWEIDE.

Vogler, fô'glêr, Georg Joseph, German musician and composer, known as the "Acht Vögelchen"; b. Würzburg 15 June 1749; d. Darmstadt 6 May 1814. He studied at Bamberg, Mannheim, Bologna, and Padua; was ordained priest at Rome in 1773; and made Knight of the Golden Spur, and protonotary apostolic and chamberlain to the pope. Returning to Mannheim in 1775 he established there his first school of music. From 1786 to 1799 he was nominally resident at Stockholm, where he conducted another Tonschule; but he was constantly touring Europe as a performer on the organ. In 1807 he settled at Darmstadt as kapellmeister, and there conducted his most successful school, at times giving concerts in German cities. Vogler made a great stir in his time as theorist and organist, not being excelled on the instrument. He attempted revolutions in organ-building. He is known as the subject of Browning's 'Aht Vogler.'

Vogt, fôkt, Karl, German naturalist: b. Giessen, Germany, 5 July 1817; d. Geneva, Switzerland, 5 May 1895. He was graduated from the University of Bern in 1833 and was associated with Agassiz in the preparation of 'L'Histoire naturelle des poissons d'eau douce de l'Europe centrale' in 1839. He was appointed professor at Giessen in 1847, where his political opinions soon caused his dismissal, but in 1852 he was chosen to the chair of geology at

Geneva, which position he occupied until his death. He led an expedition to the North Cape in 1861 and in 1878 was elected a member of the Swiss National Assembly. He was an advocate of Darwinism and a materialist in opinion. His works include: 'Physiologische Briefe' (1845-6); 'Ocean und Mittelmeer' (1848); 'Die Säugethiere in Wort und Bild' (1883); etc.

Vogüé, vò-gü-ê, Charles Jean Melchior, MARQUIS DE, French archaeologist: b. Paris 18 Oct. 1829. He was a student of Oriental religion, languages, and art, traveled in Syria and Palestine in 1853-4 and 1861-2, was ambassador at Constantinople in 1871-5, and from then until 1879 occupied that office at Vienna. He became commander of the Grand Legion of Honor in 1879, was elected to the French Academy in 1901 and is president of the Agricultural Society of France. His publications include: 'Les Eglises de la Terre-Sainte' (1859); 'L'architecture civile et religieuse dans la Syrie Centrale' (1865-77); 'Inscriptions sémitiques' (1869-77); 'Mémoires de Villars' (1889); 'Le Duc de Burgoyne et le Duc de Beauvilliers' (1900); etc.

Vogüé, Eugène Marie Melchior, VICOMTE DE, French critic and historian, cousin of C. J. M. Vogüé: b. Nice, France, 25 Feb. 1848. He was educated at Paris, served in the Franco-Prussian war, entered the government service in the department of foreign affairs in 1871, was attaché at Constantinople in 1873, secretary of the legation at Saint Petersburg in 1876, and in 1882 resigned to enter upon a literary career. He was elected to the Academy in 1888 and in 1893-8 was député de l'Ardeche. His publications include: 'Syrie, Palestine, Mont Athos' (1876); 'Les portraits du siècle' (1883); 'Le Roman russe' (1886); 'Œuvres russes' (1894); 'Jean d'Agrèze' (1898); 'Le rappel des ombres' (1900); etc.

Voice and Voice Culture. The art of singing was developed to meet the demands of modern music. That which we understand as the science of voice culture, or the means of cultivating the singing voice that it may be used as a musical instrument, came into being after music had shaped itself to express strong emotional sentiment. In the closing years of the 16th century the attempt to restore Grecian art in its several branches led to the invention of new forms of musical expression. Previous to that time, little, if any, music was written for the solo voice. There was no demand, therefore, for especial training for singing. The new forms given to music were (1) the opera, in which dramatic action was united to musical setting of the story. The story was given out by single voices, by two in dialogue, by three, four or more in unison or harmony. The plot of the opera was, from the beginning, in comedy or tragedy and secular in nature; (2) oratorio, which certainly at first was much like the opera, except that the story was from sacred writ. A form of composition invented at this time was recitative which was, and ever has been, for the single voice. Advances in these forms of composition have exacted more and more of singers. Invention of modern music created the need of special training of the singing voice and advance into larger forms of musical expression has kept the demand for

VOICE AND VOICE CULTURE

greater skill on the part of vocalists ever increasing. As modern music came into recognition in Italy (in Florence, about the year 1600) the first definite system of voice culture began there. It was devised by the composers that their operas and oratorios might be sung as they wished them sung. There was no definite plan accepted for general use during the first century of modern music.

Every composer sought some means by which to have his compositions well sung, and each followed his own course. In 1686 was born one destined to establish a semblance of order. Niccolò Porpora, born at Naples, became a composer. His operas were very florid and none were found among singers able to cope with them. His earnestness for his own interests made him, an educated man for his age, devise a better system of vocal training than had ever been used. And for the first time was established a vocal method. It was the beginning of the Old Italian method, some form of which was continued to our own time. Unfortunately, Porpora left no record of his manner of teaching. We must judge what he did from the demand his music made. His writing for solo voices called for great flexibility and range of voice and his phrases were of great length. We must suppose from this that his pupils were taught to sustain the breath a long time, to sing smoothly and rapidly and to touch with delicacy and lightness the notes in the extremes of the voice. Probably his personality was commanding and that he curbed with masterful hand all attempts on the part of his pupils to depart into anything outside these few requirements. Farinelli, one of his greatest pupils, departed from the simplicity of Porpora's rules, but not until after Porpora passed away. It is known that Porpora kept his pupils many years at work on the simplest exercises. It is related that Caffarelli, one of his most noted pupils, studied a single page of exercises for seven years and when he finally became restless, the master said: "You may go now; you are the greatest singer in Europe." Perhaps one reason why so little is known of Porpora's vocal method is because he did not remain long enough in one place to found a school which could preserve records. He wished for fame as a composer and went from city to city to make his works known. His pupils followed. That, on the other hand, spread the good vocal teaching. In every large city of Italy and in many Austrian and German places the effect of his good teaching was felt. Porpora lived till 1767 and will ever have the honor of establishing vocal method. It was not, so far as we know, scientific, yet it was definite and could be understood. His pupils who continued at Naples maintained his traditions conscientiously for a century. Others who were attracted to London, Paris and Vienna kept up a form of Porpora's vocal method. Farinelli, after a wonderful career as singer and politician (having been the power behind the throne of Philip V. of Spain), retired to Bologna where he passed the last 23 years of his life. Bologna had the honor of establishing the first great music school (which began in 1482) and was the musical centre of the day. Farinelli did not become a singing teacher by making it his profession, but he trained many of the singers who were connected with the theatre. In this

way, he more than any other, handed down the Porpora method. Nearly all the composers of the day came into contact with that method and for the first time in the history of music, vocal method influenced composition. Mozart had singing lessons with pupils of Porpora. Haydn was accompanist to Porpora for three years. Rossini was born into the Bologna life. Bellini, Donizetti and Mercadante were all educated at Naples where the traditions were most rigorously preserved.

Into our own day the influence of the Old Italian method has been projected through two distinct lines: that of Francesco Lamperti and of Manuel Garcia. Each has, perhaps, departed from the old rules, necessitated by the changed conditions of music. Before considering the work and vocal methods of these two men it is well to see if in the remark of Mancini, himself a great singing teacher and a fellow pupil of Farinelli, we may gain a little more definite knowledge of the principles of Porpora. Mancini says regarding Farinelli, "The art of taking and keeping the breath, so softly and easily that no one could perceive it, began and died with him. The qualities in which he excelled were the evenness of his voice, the art of swelling its sound, the *Portamento*, the union of the registers, a surprising agility, a graceful and pathetic style and a shake so admirable as it is rare." So far as known there is no more complete description of vocal method of that day.

Lamperti, judging from his pupils who are very well known, kept most closely to that method. He was born in 1813 and when seven years of age entered the Conservatory at Milan for the study of piano and composition. He was ambitious to manage opera companies when he became a man and shaped his training for the theatre. He associated himself, eventually, with the manager of the small theatre at Lodi. That seems to have been his only venture in theatrical management, but it served to shape his life in an unexpected manner. Financial resources being small he was forced to train the local singers for the solo parts. He was so successful that many of those peasants attracted attention and were engaged for the theatres of London, Paris, Saint Petersburg and other European cities. It makes the most striking example in history of the power of one man to create a school of singing. Their successes led many great artists to visit Lamperti at Lodi, and his popularity caused the government to make him professor of singing at the Milan Conservatory in 1850. For the next 25 years many of the greatest singers studied with Lamperti and this made Milan the centre of the operatic world. In 1875, Lamperti was retired on a pension, but continued as a private teacher until his death in 1893. Even Lamperti did not write a vocal method. Mr. Griffith, one of his earnest pupils, gathered slips of paper on which he wrote comments for his pupils and from them has given us a little idea of the method. One remark by Mr. Griffith is, "Basing his teaching upon the study of respiration, the taking and retention of the breath by means of the abdominal muscles alone, and the just emission of the voice, he thoroughly grounds his pupils in the production of pure tone." That is not unlike the remark of Mancini about Farinelli's method. If the Old Italian method has come into our

VOICE AND VOICE CULTURE

day in any degree of purity it has come through the adherence of Lamperti to those principles of breath control.

Manuel Garcia, Sr., was born eight years after Porpora died. In 1812, when 37 years of age, he studied at Naples under Anzani, who was particularly zealous in preserving traditions. Garcia, too, was to be an impresario and his thought was given to the training of singers for his own companies. But, with these duties, he saw the advantage of having a school at London. This was established in 1823. His own children were trained by him and three of them became celebrated. Maria, known as Mme. Mahbran, was one of the greatest singers of any age but lived to be but 28 years of age. Mme. Viardot-Garcia, still living at Paris, was born in 1821. She served as accompanist for her father and learned his method more from absorption than from actual lessons. She grew up in the highest musical life of the day. Manuel Garcia, Jr., was born in 1805, still living at London, became one of the most important men in connection with vocal method. He sang for a few years in his father's companies, but elected to adopt teaching as a profession. He was one of the first men to become a vocal teacher who did not have special interest in producing his own operas or in preparing singers for his own companies. It is probable that he has the honor of establishing the vocation of voice teaching on professional lines. Whether that be so or not he made scientific investigation of the voice on which he established a distinct vocal method. He invented the laryngoscope, a device for examining the throat, including the vocal chords and larynx. This has become universally adopted by physicians. Garcia was able, with his examinations, to announce definite facts about the action of the throat in singing. Action had been observed previously through sensation and because it had manifested itself through the outer flesh. It is worthy of remark that although earlier teachers were obliged to walk by faith rather than by sight they had not gone far from correct ways. Nor did Garcia's discoveries add much knowledge. It permitted him and his followers to move with greater certainty. It led to the formation of vocal method on the idea of tone-placement. The registers of the voice assumed more definite position as factors in method. Whether Garcia became so interested in the scientific action of tone production and its reflection in chambers of resonance, as to obscure his views of respiration, or whether he became convinced that respiration was not important, does not appear. But he ignored very thoroughly that which was fundamental in Lamperti's work. He established a method with new basic principles, and that method sprang into popularity. At that time in the history of vocal method there were two distinct systems: one based on empiricism; the other on science. The first took into account the sound of the tone and judged what would make it good; the other explained the scientific action which would produce good tone. As each method has produced many noted artists there need be no comment on the merits of either. The advocates of both schools have held quite closely to the tenets of the two great leaders, although modifications, as well as additions, have been made. Modern music continues its greater demands and dis-

coveries in science compel further adjustment of deductions based on scientific vocal research.

In 1845, Mathilde Graumann, now Madame Marchesi, became the pupil of Garcia, the inventor of the laryngoscope. For a time she acted as assistant to Garcia and, as it was just the time of Garcia's deep study which led to the establishment of a new vocal method, it is reasonable to suppose that she was influenced by that in forming her own. Her husband, Salvatore Marchesi, was also a pupil of Garcia. The "Marchesi" method is more often mentioned than is any other to-day and it has the Garcia principles for its foundation. Many of the great opera singers have been guided in their education by Madame Marchesi. It is, however, a matter of comment that these artists differ radically in vocal method, and probably the teacher has considered the individuality of her students more than she has adherence to vocal method. Nor would this necessitate departure from Garcia's principles, for such is the subtlety of the mind in dealing with vocal machinery, there is always need of adaptation of method to traits of mind which are individual. And that ability so to adapt may constitute the "Marchesi" method. It may be even the establishment of a new method.

Italy, ever the home of opera, has adopted vocal method which more dramatic music demands. Language is a factor in creating or changing vocal method. The flowing tone of the Italian, with every word ending in a vowel or liquid consonant and with guttural and harsh consonantal combinations almost eliminated, does not lend itself well to the tone placement of the Garcia school. Nor is the method of Lamperti sufficiently vigorous to meet dramatic demand. A compromise seems to have been effected. Breathing is the basis of it, and it is the breathing of the upper chest, with the abdominal muscles held inward with great firmness. This enables its votaries to utilize to a certain extent the scientific tone placement of Garcia. The combination leads to tone production with a degree of harshness which was foreign to the older Italian method. Few professional singers have become prominent under its leading.

Opera demanding extremely dramatic voice has found favor in Germany, and vocal method has been devised on lines which are not part of either of the older schools. Nor is it possible to make explanation of the German method on scientific grounds. The voice is used explosively and with less attempt to sustain the smooth flow of tone which has ever been deemed essential to good singing. Yet the public has learned to enjoy German singing, which is most convincing proof that there is reason for it. Wagner, it is said, did not hope that his operas would ever be sung well nor could they be given in any school of voice training which existed when they were written. In the German method of training the voice is found a way by which the operas can be sung. And this class of music is the only one to which that method can be applied. Explosive tone is quite out of place in the music of song writers even among Germans.

Language has influenced the formation of a method in vogue among the French singers. The nasal consonants of the French language

VOICE AND VOICE CULTURE

call for decided nasal resonance, and the vocal teachers of Paris seek to obtain such resonance as the predominating factor in tone production. In the department of breathing they exact high chest breath control. With this as foundation and with exaggerated nasal resonance there is shrillness of tone emission. The difference between French method and modern Italian lies in the point of resonance of tone. The Italian places the tone in the forward part of the mouth, and the French in the nasal chambers, while both use high chest breath control as foundation.

The other nations have no distinctive vocal methods. England and America have been content to follow the lead of other peoples. Many individual teachers have, through their strong personality, made reputations as teachers, and the public has accredited them with vocal methods quite their own. Thus, William Shakespeare made international reputation as having a vocal method. In some particulars it is individual, but it is based on that of Francesco Lamperti which was as nearly as can be the Old Italian method.

One system which had no special home but which has scientific basis and has many advocates is the "Overtone" method. Theory claims that every musical tone is compound in that it consists of the vibration of the tone-producing organ as a whole for the initial tone and the vibration of its aliquot parts as added tone. For example, the tone made by the stroke of the hammer on the piano string vibrates the string its whole length, its half length, quarter length and eighth length. Also, the divisions at the third, fifth, sixth and seventh of the whole vibrate. Sensitive ears can detect the lower multiples of the rate of vibration of the note struck. Using the piano string one can demonstrate the truth of this theory. The tones added to initial tone have been called "harmonics," "upper partials" and "overtones." Some vocal teachers believe the vocal chords have action which corresponds to that of the piano string and have constructed a vocal method which seeks to incorporate upon the initial tone an abundance of "harmonics." Other teachers of the overtone method claim that every part of the resonance chamber of the throat and mouth is a point of birth of "harmonics." They then seek to make junction of these voices with the initial tone made by the vocal chords. One ingenious scientist has shown this theory can be illustrated by a series of flames which register what vibration of aliquot parts is given each tone. Photographs are made of the flames. It makes a visible record which enables a student of sufficient intelligence to direct his practice.

In the studios of vocal teachers "Open and Closed Tone" method is often spoken of, but it is doubtful if a distinct vocal method has ever been built on this idea. Garcia advocated using open tone in the low voice and closed in the upper. Lamperti advised open tone throughout the voice, at least in practice on exercises and vocalizes. It would seem as if "open and closed tone" method is a varying adjunct of several methods, rather than distinct vocal method by itself.

In the last few years a theory has been advanced which may serve as ground for a new method. It is that tone is primordial substance,

present in everything, as is electricity; that by stimulating vibration in the vocal machinery at the proper rate to make audible the tone which is present, our musical tone is produced. Voice culture, in this system, consists of stimulating the sounding machinery at just the right degree of vibration, soliciting above all, such counter balance of effort that the act of singing is unfeigned and the appearance of effort hidden. This method further contemplates that transmission of tone is made amplification of the vibration of the vocal machinery.

Examination of all methods of training the voice in vogue emphasizes the belief that none can have universal endorsement. This comes about because there are so many views of music and of the requirements for singing modern music. All unite in saying that singing should be without effort; but such is the difference in perception of sensation that what seems effortless to one appears charged with effort to another. The latter fact points out the need of some scientific measure by which test may be made of this important element in singing. A barometer or thermometer would establish a vocal method. The one to invent such an instrument has not been found. Garcia opened the way for scientific examination of the voice, but no one has advanced in the science and Garcia's discoveries did not create a method generally endorsed. Among vocal teachers it is common saying that there are two vocal methods, the good and the bad. Each believes his to be good, but as they differ very much all cannot be good. All know that breath must be used to create vocal tone; that tone emission must be with comfortable action in the throat; that transmission of tone must be generous and the tone given be vibrant. The way to secure these constitutes good method. Every teacher has his own way by which to attain these desirable ends, and the individuality prevents general acceptance of any one system. Again, vocal teachers who depend on their individuality are little likely to invent any scientific testing machine. Method which can have universal acceptance and application will come only from deductions made by practical teachers working out the suggestions which scientific men make, which will come from invention. The telephone came near showing new forms of transmission and reception of tone. It supplied the idea that tone is awakened into audible vibration and endorsed the teachers of the "Primordial" method. Nor is it certain but that further experiments in which electricity plays an important part will supply views on which to base vocal method. It is a subject of vast importance. In this, vocal methods for singing have been considered because training the voice for that art is supposed to be the most important and extended training the voice can have. When we think of the large number of actors, elocutionists and public speakers and recall that each needs to use true principles of voice culture, the importance of having a definite and universally applicable vocal method seems almost imperative. When we realize that the constantly used conversational voice would be an infinitely more valuable implement of communication between human beings were it cultivated as it might be, the need of perfect (and universal) vocal method assumes large proportions. If, as many believe, voice

VOICE, SPECIAL FEATURES OF ORGANS OF

culture is one of the most valuable prophylactic and therapeutic agents known, such need is absolutely imperative.

Schools of music have been established in all large cities, and of course the study of singing has been made prominent. It has not, as a rule, been the chief study. It has been forced to fourth place, composition, piano and instrumental playing having been given precedence. Wherever the study of singing has been given special prominence it has attracted more students to the school and has made more lasting impression on music. Thus, Lamperti made Milan with its conservatory, noted. The Royal Academy at London has, since the day of Handel, had a large number of great vocal teachers and that has given power to the school. The New England Conservatory and the Chicago College of Music have produced many excellent singers, but the fact remains that none has advocated special vocal method. Training has been on lines widely separated and left entirely to the judgment of individual teachers. As all have produced results, although using means so different, it is evident that training the voice for singing modern music can be had through the personality of the teacher developing the musical nature of the student. This has taken the place of method. Many teachers, in late years, have written treatises on singing and which are intended, although frequently not so claimed, to be descriptions of vocal methods. Garcia's method was described in a book issued about 1865. It has since been revised and simplified. Madame Seiler, Madame Marchesi, and Messrs. Randegger, Behnke and Alberto Bach have described their methods in print. Nor must we forget some very excellent works by American writers. Frederic Root, D. A. Clippinger and Edmund J. Myer have written clearly and well on vocal methods. As their works are the latest and they are men grown into the strong thought of present activity, their writings have definiteness which was lacking in many earlier works. There is a growing belief that American teachers are taking the most advanced position with regard to certainty in method, and that study of singing can best be prosecuted with such teachers. That which is most evident in their work is that they combine scientific with empirical teaching, and they bind the whole together with directing power of intellect and soul. At no time has it been possible to ensure that anyone possessing any degree of vocal resources shall become an acceptable singer as it is now. This is true, in spite of the fact that never before has music demanded so much of singers.

Judging from methods of the past and present we may believe that the voice for singing can best be trained on the following general lines, allowing, of course, that individual natures demand departures and special applications:

There are three general departments: physical, intellectual and spiritual. The latter refers to the intuitional and emotional action of the spirit of man. The physical training has in it development of respiration, freedom of the throat and reverberation of tone. Respiration demands that muscles of inspiration and expiration shall be made free and strong and made to balance their action so as to deliver breath pressure to the vocal chords, which make initial tone, in such way that tone is made without apparent

effort. This corresponds to the way of the Old Italian method. It seems a simple thing, but the old singers evidently found it necessary to study and practise it every day for years and perhaps for lifetime. Freedom of the throat means that tone of every gradation of power, from softest to loudest, shall be emitted in purity; that elasticity of muscle shall permit constant and instantaneous changes in the larynx, that the chambers above the larynx which influence quality shall be supple, and that the organs which regulate articulation shall not be interfered with, even in the slightest degree, while performing their duties. Reverberation has in it the whole matter of tone-placement, vibration and transmission of musical sounds. Such use of physical training draws, then, from the empirical ways of the old school, the scientific method of the Garcia system and the ways of the "overtone" method.

The intellectual department of modern method demands of the student knowledge of anatomy and physiology; directing power of the mind; and familiarity with psychology. Education of the objective mind is the controlling factor in this part of vocal method. To small extent has it been used in any earlier methods. It is probable that in that department the strongest factor in modern vocal method is found. For the intuitional or emotional side has ever been used and perhaps singers of the past (notably Farinelli) cultivated this side to perfection.

Intuitional influence in modern method is not left to chance as possibly it has been before. A real student of our times is led to understand his relation to the controlling force of the universe and to utilize the power he may obtain through what is often termed "higher thought." But it is not left to be expressed "intuitionally." That is, the student learns what imagination, sentiment, will and the like are, and then, through his objective mind (intellectual department) directs their influence upon the physical parts. For it is now known that, however carefully, correctly and thoroughly the machinery of voice is used, there is a voice better and more beautiful than such machinery can, by itself, produce. The development of vocal method, thus very briefly outlined, is engaging the serious attention of the best American teachers who make teaching a profession, and there is evidence that such study is making a new vocal method.

Editor 'Music Life.'

Voice, Special Features of Organs of, in Man. The vocal organs of man and apes are similar, basically, in structure; but in man all that enters into the perfecting of the speaking voice has been vastly improved. In the first place man has fortunately discarded or rendered vestigial the voice-pouches occurring in certain man-like apes, permitting these animals to produce demoniacal sounds which make night hideous. Whatever vestiges of these appear in man are found connected with the larynx, behind the Adam's apple. The complete command over the product of voice man secured when the alveolar arch and palatine area became shortened and widened; and when the tongue, by accommodation to the modified mouth became shorter and more horizontally flattened. The control of the tongue, again, was accomplished by his

VOICE, SPECIAL FEATURES OF ORGANS OF

gaining possession, on the inner centre of the ordinary human jaw, at the central curve or symphysis forming the chin, of a small bony tubercle, known as the genial tubercle, the movements of the tongue, as an organ of speech, being effected mainly by the action of the muscle inserted into this tubercle, absent in some primitive "human" jaw bones; and entirely absent in the man-like apes.

It was the rise of man in the world and the gaining of complete equilibrium in his erect attitude, that, however, was one of the chief means of readjustment as it was one of the specific evidences of human advance. It gave man a wider horizon, opened up his dormant imagination; raised his chin and his chest. The chest was freed from the pressure of the bowels, giving freedom to the development of the lungs, as the source of supply and control of the breath. The man who stood best before his fellows was the man whose voice carried further. This was accomplished by the greater resonating power of men who "possessed nose." Blaise Pascal (1662) had already noted a concrete example: "If the nose of Cleopatra had been shorter the whole face of the earth would have been different." This is a fact that science is only now explaining. The Romans, large nosed, were leaders and conquerors. They were strong men; and strong men had strong passions; the orientals call an angry man a "man of nose." Command and passion speak in short tones; and "syllables govern the world." In giving command a short word is always used: Oppian advised the giving of short names to dogs from this very fact.

But the force impelling speech is, at last, psychical. Hence the necessity of the study of the brain in connection with speech. The faculty of language has been found to have close relations with one of the frontal convolutions, which is anatomically most perfect in man, in anthropoids rudimentary, and in the inferior monkeys entirely absent. The location of the zone of speech is in one hemisphere only, according as the individual is right- or left-handed. Its location is the opposite to the side of the hand preferred: in most, or right-handed, persons, it is on the left, and *vice versa*. "Right-handedness and speech are controlled by the same hemisphere of the brain and from contiguous areas; so that if right-handedness was first used for expression before speech that speech has arisen from the setting aside for further development of the area in the brain first used for right-handedness. The indication of the close association of right-handedness and speech in the same location of the brain, might suggest that they developed together. That is, that as soon as man began to use his arms for the possession of the necessary food for hunting, he might have contemporaneously or simultaneously gained some progress in utterance" (Baldwin).

The nourishment of the psychical basis, the brain, is therefore essential. It is the supply of blood to the brain that controls our emotions: bounding freely through the arteries of the brain it effects our consciousness as an emotion of the exalting class. Rapid thought, hurried speech, vigorous gesture, are results of strong body excitement caused by dilation and increased blood flow, controlled by the sympathetic nervous system. On the other hand with contraction of the arteries, that is, lessened

blood flow, we have sluggish thought, languid movement, and uncertain speech. Meinert has calculated that the brain may contain six hundred million cells, each of which contains an incalculable number of atoms. Hence the importance of nourishment, which means growth. Here the experiments of Elmer Gates of Washington, may be referred to, as he demonstrates the necessity not only of proper brain nourishment through the blood, but of their nourishment, in proper environmental associations. Speech, appealing to the sense of hearing, the capacity of audition, on the part of the listener, as well as that of the speaker (it being found that the speaker hears his own voice differently from the listener) is a feature that is undergoing careful study.

The child's speech apparatus is of much smaller dimensions than in adult man. The resonance chamber is smaller, and more energetic adjustments have to be made whenever definite resonance is required, by changing the angle of the jaw, the position of the tongue, or the conformation of the lips. The lungs have not sufficient depth; the pectoral muscles are but slightly developed, the breathing is accomplished much more through the diaphragm than through the active expansion of the pectoral cavity, hence breathing movements are more superficial and irregular than in later years. Speech requires complete control of the breathing mechanism, which the child has not yet got, while he still wants in his organ a large number of "strings, whistles and registers," the larynx being still small and undeveloped; and so with the tongue, the lips and the muscles moving them; while the teeth are still entirely wanting. The undeveloped condition of the auditory apparatus and the brain have also to be taken into account.

Lastly, in regard to the highest development of the human voice in song, the action of the three hollow spaces, nasal, oral and laryngeal, has much to do with the modification and modulation of the singer's voice. These spaces are to the vocal bands what the violin is to the strings; and, for every tone and vowel the mucous membrane of the spaces named must be drawn into a special position (including the position of the larynx) before the air in the spaces can be brought into vibration by the action of the vocal bands. But the vibration of the cords alone is never the tone. The surfaces of the mucous membranes are drawn into different shapes, particularly fit to produce tone-waves or to disturb them, and to produce in such tone-waves, not only fundamental tones, but over-tones. The tongue is a large and direct agent in formation, in the middle or oral space, as it is connected with the upper part of the larynx; its derangement in action being alone sufficient to utterly destroy tone, or, on the contrary, when well adjusted and hanging normally in relation to the other voice parts, to give what is termed the silvery quality to the voice. These spaces are as important in producing the modification and modulations of the singing voice as are the vocal cords and intrinsic muscles of the larynx; there being no doubt, however, that the movements of the larynx depend upon and are controlled by the muscles and movements outside that organ. The control of the motive power, the breath, is of the utmost importance in maintaining the

VOICING—VOLATILE OILS

fixation and cord stretching of the vocal mechanism.

From the above it will be seen that speech is a product of mechanism finely adjusted and controlled by forces of the highest mental development, making man what he is. See **SPEECH, ORIGIN AND NATURAL HISTORY OF.**

Voit, foit, Karl von, German physiologist: b. Amberg, Bavaria, 31 Oct. 1831. He was educated at Munich, Würzburg, and at Göttingen, and in 1863 became professor of physiology at the University of Munich. He was early engaged in scientific researches, his first achievement of importance occurring in 1854, when he proved the presence of urea in the muscular tissues of cholera patients. He subsequently made a specialty of questions of digestion and assimilation. His works are numerous, and among them are included: 'Physiologisch-chemische Untersuchungen' (1857); 'Ueber die Kost in öffentlichen Anstalten' (1876); 'Untersuchung der Kost in einigen öffentlichen Anstalten' (1877).

Vokas, vōka, (Theodora) Rosina, English actress: b. 1858; d. Torquay, Devonshire, 27 Jan. 1894. She first appeared at the Alhambra Palace, London, in the 'Belles of the Kitchen.' In 1885-93 she toured North America. She took leading parts in 'The Parvenu,' 'The School-mistress,' 'The Milliner's Bill,' 'The Circus Rider,' 'Maid Marian,' and 'A Pantomime Rehearsal.' She was married to Cecil Clay in 1880, and for a time retired from the stage.

Volapük, vō-lā-pük, a proposed universal language invented about 1879 by Johann Martin Schleyer, of Constance, Germany. The name means "world-speech," being based on English *world* and *speech*, and a number of the vocabularies are modified English words, the total number in the language being about 14,000, some 1,300 being root-words. Its structure the language is simple and extremely regular, and the orthography is entirely phonetic, the words being pronounced as they are written, and *vice versa*. The study of Volapük, after having made some progress, has latterly declined; but there are still periodicals written in it, and associations devoted to its dissemination. Various other attempts to provide a universal language, especially one suited for commercial purposes, have been made in recent times. See ETYMOLOGY; PHILOLOGY; SCIENCE OF LANGUAGE.

Volatile Oils, or Essential Oils, vegetable oils distinguished by the possession of pungent, characteristic odors, and by the fact that they can be vaporized without decomposition, and usually without any considerable residue. The volatile oils differ from the "fatty oils," or "fixed oils" (of which olive oil is an example), from a chemical point of view, in consisting mainly of hydrocarbons, and in containing little or no true fat.

The known volatile oils are very numerous,

and are obtained from plants, or parts of plants, or from vegetable exudations, mainly by the action of heat or pressure, or by the solvent action of fats. In some cases, as in the extraction of the essential oil in orange peel, a portion of the oil may be obtained by placing the material containing it in horse-hair bags, and subjecting it to pressure. Distillation is also commonly employed, the plants or parts of plants containing the oil being placed in a still with water, the contents of the still being constantly stirred, and heated by means of a steam-jacket. The boiling points of the volatile oils are mostly higher than that of water, but as they possess a considerable vapor tension at the boiling point of water, they distil over at that temperature in sufficient quantity to make the process commercially practicable. In some cases, it is found to be advantageous to raise the boiling point of the water in the still somewhat, by the addition of salt. When the oil that is to be prepared is injured by exposure to the temperature of boiling water, it is customary to extract the oil by macerating the plant with grease. In the preparation of perfumes, for example, it is common to treat the flowers containing the oil with pure lard or paraffin, which is kept fluid by a water-bath. The fat extracts the volatile oil, and when the charged fat is afterward shaken up with alcohol it gives up the oil, in large measure, to the alcohol. The process known as "enfleurage" is essentially the same as the one just indicated, except that it is not conducted by the aid of heat, the grease being allowed to remain in contact with the flowers for a longer time, at a lower temperature; the oil then being recovered from the fat by means of alcohol, as before.

The following are the more familiar of the essential or volatile oils:

Oil of Bitter Almonds.—Prepared by distilling the pulp that is left after the fixed oil contained in the almonds has been expressed by pressure. It consists mainly of benzaldehyde, C_6H_5CHO , and boils at $179^\circ C$.

Oil of Bergamot.—Prepared from the unripe fruit of *Citrus Bergamia*, by squeezing the rind by hand and wiping the expressed oil off with a sponge, the sponge being squeezed at intervals into a collecting vessel. It contains a considerable quantity of the hydrocarbon citrene, $C_{15}H_{26}$, together with other compounds whose precise nature has not yet been thoroughly investigated. The oil is extensively used in perfumery.

Oil of Cloves.—Obtained by distilling the flower buds of *Caryophyllus aromaticus*. It consists of a mixture of sesquiterpene and eugenol and is heavier than water.

Oil of Eucalyptus.—Prepared by distilling the leaves of the eucalyptus tree. It is pale yellow in color, and is used in medicine and in perfumery. Its chief constituent is cineol, $C_{10}H_{18}O$.

Oil of Lavender.—Prepared by the distillation of lavender flowers, the best quality being made from *Lavandula vera*. Oil of spike is an inferior variety, prepared from *Lavandula Spica*. Oil of lavender is used in perfumery, and oil of spike is extensively employed in porcelain painting.

Oil of Lemon.—Prepared from scarcely ripe lemon rinds by the sponge method, described above under "Oil of Bergamot." An inferior variety is also prepared by distilling the residue

VOLCANIC ROCKS—VOLCANO

remaining from this process. Oil of lemon consists chiefly of limonene, $C_{10}H_{16}$, a hydrocarbon which resembles the citrene of oil of bergamot, but which differs from it in certain particulars. Oil of lemon is used in confectionery and perfumery.

Oil of Origanum, Oil of Thyme, or Marjoram Oil.—Obtained by distillation from certain species of marjoram.

Oil of Peppermint.—Prepared by distilling the herb *Mentha piperita*. It consists chiefly of a solution of menthol in various terpenes, and is used in medicine and as a flavoring, especially in confectionery.

Attar (or Otto) of Roses.—Prepared by the distillation of certain species of roses, and especially from *Rosa Damascena*, which is cultivated in Turkey. It is used extensively in perfumery, and, on account of its high commercial value, is often (and perhaps always) adulterated. The most common adulterant is "geranium oil," which is manufactured expressly for adulterating attar of roses, by distilling a species of grass that grows in India.

Oil of Turpentine.—Prepared by distilling the resinous exudations from certain species of pine trees. American oil of turpentine is prepared chiefly from *Pinus australis*, and consists mainly of dextro-pinene, a hydrocarbon having the formula $C_{10}H_{16}$, and boiling at 156° C.

A. D. RISTERN, Ph.D.,

Editorial Staff, 'Encyclopedia Americana.'

Volcanic Rocks. Those igneous or pyrogenic rocks which have reached the surface through volcanic necks or through fissure eruptions. Volcanic rocks were formed in all ages of the earth's history, but were generally more or less restricted geographically. Contrasted with them are the rocks which cooled beneath the surface to which the name plutonic is generally applied. Extrusive (effusive) and intrusive are other terms used for these rocks. At best this distinction is only one of convenience, and has no great scientific value. Among the more important rocks of this type may be mentioned, obsidian, pumice, rhyolite, trachyte, felsite, andesite, and basalt (qq.v.).

Volcano (Ital. *volcano*; from Lat. *Vulcanus*, the god of fire; originally the volcano of Etna, the fabled abode of the god), an opening in the crust of the earth from which proceeds heated gases (hydrochloric, sulphurous, etc.) sometimes in flames, volumes of steam, eruptions of ashes mixed with scoriz and large stones which are often red-hot, and of molten rock, called lava. The phenomenon is chiefly limited to certain regions in different parts of the earth, known as volcanic districts; and in these districts established and permanent vents may continue constantly sending forth smoke and flame, like Stromboli on one of the Lipari Islands in the Mediterranean; or eruptions of more severe character may take place at irregular intervals. The matter thrown out from volcanoes generally accumulates around the openings or craters till they build up a hill, or even a mountain several thousand feet high; but the vent may continue for a long time at a low level, and is even formed beneath the sea, sometimes without rising above the surface. Instances have occurred of a volcanic eruption suddenly forming an island in the midst of the sea. Other volcanoes that have been suddenly raised up

have remained permanently in the form of mountains. Such is the volcano of Jorullo (q.v.) in Mexico. The greatest volcanic mountains, as Etna, Hecla, and Vesuvius, are produced by accumulations of volcanic matters, as beds of lava, ashes, and scoriz, sometimes alternating with beds deposited beneath the sea charged with the vestiges of marine animals, the collection of which must have occupied long periods of time. This is especially apparent in the case of Etna. Volcanoes sometimes remain inactive so long as to lose their peculiar character; but they may at any time break forth again. Vesuvius was not known to the ancients as a volcano, though it was apparent from the form of the mountain and the materials of which it was composed, that such must have been its character at some former period. Volcanoes which show outbursts of more or less frequency are called *active*. Those known to have been active in historic times, but long quiescent, are called *dormant*. Ancient volcanic mountains are met with in Hungary, in central France, and other places, of whose eruptions no record exists. Such are termed *extinct* volcanoes, but they may at any time become active. Probably the most general understanding of a volcano is of a conical hill or mountain. There is, however, no limitation as to height, some comparatively low volcanoes, such as Pelée and Soufrière, manifesting violent and disastrous eruptions, while, on the other hand, such lofty peaks as Kilimanjaro, Cotopaxi, and Popocatepetl are of a volcanic character.

As generally considered, a volcano is divided into three fundamental parts—the base, or elevation proper; the cone, rising steeply from the base; and the crater, the depression occurring at the summit of the cone. These parts are not invariably present in distinct form in all volcanoes; in many, eruption takes place without any crater. Nor do eruptions always proceed from the crater, when present; the crater being located at the summit of the cone, while activity is in many cases exhibited independent of the crater by supplementary craters in additional cones, broken out on the slopes of the mountain. Craters of course vary greatly in size and sustain no proportional relation to the mountain or elevation. Haleakala (island of Maui, Hawaii), 10,000 feet, has a crater of 20 miles' circumference; but the crater of Orizaba (Mexico), on the boundary between the states of Vera Cruz and Puebla), $3\frac{1}{2}$ miles, has a crater with a diameter of less than 1,000 feet.

The causes of volcanic action are still much obscured, though various explanatory theories have been advanced. In early times, the rising cloud of dust attending an eruption, lit by the glow of the lava, came readily to be regarded as mingled smoke and flame, and blacksmith-gods were thought to have their forges in the subterranean regions. The view now generally accepted is that internal heat, which increases toward the earth's centre, causes the evolution of a great body of elastic vapor, which, expanding and seeking an outlet where there is the least resistance, manifests itself in the upheavals and explosions of an eruption. The body of vapor is thought to be derived from the superficial mass of the earth, become hydrated, or combined with water. Such action, as well as the presence of the molten rock known as lava, is accounted for by vast internal displacements,

bringing the inner crust, with its high temperature, nearer to the surface. Volcanoes are, in general, to be found in areas where the earth's crust is of an inferior strength. These areas are naturally ocean-basins, the territory bordering on such basins, or the ranges of mountains marking or flanking the outlines of the continents. With the possible exception of Wrangel (Alaska) no active volcano exists far inland save in a district which is either the scene of a comparatively recent displacement or is marked by an instability in the earth's crust. One of the chief lines of distribution surrounds the Pacific Ocean, running along the western coast of South, Central, and North America; the Aleutian Islands, Kamchatka, and the Kurile group; Japan, Formosa, the Philippines, the Moluccas, the North Hebrides, New Zealand, and South Victoria Land. Included within this line are numerous other volcanoes, such as Kilauwa, Mauna Loa, and Mauna Kea (Hawaii), and those of the Polynesian Islands. In the Atlantic section are the Antilles, the Canaries, the Azores, the Cape Verde, Iceland, Madeira, etc. The European line follows the Mediterranean, and is continued into eastern Asia, about the Caspian. It includes the Lipari Islands, the Ægean Islands, Etna, Vesuvius, Ararat, and Demavend. J. W. Judd ('Volcanoes' 1881) estimated that there are from 300 to 350 vents of customary activity. There are perhaps about an equal number whose latest activity was at a date comparatively recent.

The phenomena of volcanic activity are numerous and varied. A great portion of the material upheaved in an eruption is lava. The kinds of rock composing this are largely silica and silicates, those containing a relatively small percentage of silica being called basic, and those containing considerable silica, acid. The acid variety of lava is the lighter; sometimes it does not move from the lava vent, and when it does it generally proceeds a short distance only, solidifying in a thick mass. The basic is much more liquid, and covers the slopes of the mountain or forms a lake on the adjacent plains. When lava is imperfectly fused and large quantities of steam are present, the lava becomes, as it approaches nearer the surface, filled with bubbles, which continue to expand, lightening the lava and facilitating its upward movement. At the surface, the lava is torn apart by the steam, the fragments being hurled high in the air. These fragments are known as cinders, or, when finer, ashes. There are also numerous accessory phenomena, such as earthquakes (see EARTHQUAKES); electric and magnetic disturbances; and various acoustic manifestations. The explanations of these phenomena have not yet been satisfactorily reached. One of the most remarkable examples was the disturbance of the magnetic field throughout the world which accompanied the Pelée eruption of 8 May 1902. Contrary currents of air also occur, some advancing before the clouds of the eruption, others moving toward the volcano, apparently into vacuum caused by the abrupt explosion of steam. The geysers of Yellowstone Park, the solfatarae (vents from which proceed sulphurous fumes) of Italy, etc., are signs of a decreasing volcanic activity in the areas where they occur. Globe' (1874); Dana, 'Characteristics of Volcanoes' (1890); Judd, 'Volcanoes' (1881); Scrope, 'Volcanoes' (1872); Mallet, 'Volcanic Energy' ('Philosophical Transactions' of the Royal Society 1873); Russell, 'Volcanoes of North America' (1897); and Heilprin, 'Mount Pelée and the Tragedy of Martinique' (1903). See also articles on individual volcanoes.

Vole, an assemblage of rodent mammalia, belonging to the muridae, or rats and mice, and distinguished by the enamel of the rootless molar teeth being folded in the form of a double series of alternating triangles. The ears are very short and rounded, and the soles of the feet are hairless and tuberculate, while the tail is relatively short. The body is stout and heavy, the legs short and the movements clumsy. The voles and their immediate allies form a sub-family (*Microtina*) of the *Muridae*, known in this country as meadow-mice or field-mice (q.v.). Consult Miller, N. A. Fauna No. 12, U. S. Dept. of Agriculture; Bailey, Id. No. 17; and Stone and Cram, 'American Animals,' New York, 1902.

Volga, *völ'gä*, a river in Russia, the longest in Europe. It rises among marshes and small lakes beside the Valdai Hills, in the government of Tver, at an elevation of about 550 feet above sea-level, and falls into the Caspian Sea by many mouths, at Astrakhan. Its basin has an area of about 563,300 square miles, and its entire course, including windings, is about 2,200 miles in length, while its fall from source to embouchure is only 630 feet. It flows at first southeast about 90 miles to Zubtsov, thence generally northeast past Tver to Mologa, thence east by south past Yaroslavl, Kostroma and Nijni-Novgorod, to the vicinity of Kasan. Here it turns south, flows circuitously south-southwest, past Simbirsk and Saratov to Tsaritsyn and Sarepta, making a marked eastward bend at Samara, and thence southeast to the Caspian. At Tsaritsyn it sends off a branch, the Akhtuba, which flows parallel to the main part of the river, and is connected with it by many cross branches. Its principal affluents are the Oka and Kama, the one joining it from the southwest, the other from the northeast. The Volga is navigable almost from its source, and below Nijni-Novgorod it floats quite large vessels; but its navigation is impeded by shallows and sand-banks, and in winter by ice. Passenger steamers similar to those of American rivers ply upon it. By a judicious system of canals it communicates with the Caspian, Baltic, Black, and White Seas. The short railway from Tsaritsyn to the river Don has diverted much of the traffic from the lower Volga and the Caspian to the lower Don and the Sea of Azov. The banks of the Volga are fertile, and often well-timbered. The river abounds in fish, particularly sturgeon, carp, and pike of extraordinary size.

Volhynia, *völ-hin'i-a*, Russia, a southwest government, bounded north by Grodno and Minsk, east by Kiev, south by Podolia, and west by Austrian Galicia and Poland; area, 27,743 square miles. The capital is Zhitomir. In the south there are spurs of the Carpathians, but the north is low and largely marshy. The whole drainage is carried to the Dnieper by numerous small streams. The climate is mild, equable, and in general healthy. The soil is almost all remarkably fertile, producing abundant crops of all kinds of grain, particularly wheat of excellent quality. Beets and tobacco are important

VOLITION—VOLTA

crops. There are also considerable manufactures. Pop. (1897) 2,997,902.

Volition. See **WILL**.

Volkman, fölk'män, Alfred Wilhelm, German physiologist: b. Leipsic, Germany, 1 June 1801; d. Halle, Germany, 21 April 1877. He was educated in Leipsic, London, and Paris, was appointed professor of physiology at Dorpat in 1837 and in 1843 accepted the chair of physiology and anatomy at the University of Halle. He made a specialty of the study of the nervous and optic systems. His writings include: 'Anatomy of Animals' (1831-3); 'The Independence of the Sympathetic System of Nerves' (1842); 'Elasticity of Muscles' (1856); 'Physiological Researches in the Department of Optics' (1863-4); etc.

Volkman, Richard von ("RICHARD LEANMAN"), German surgeon and author, son of Alfred Wilhelm Volkman (q.v.): b. Leipsic, Germany, 17 Aug. 1830; d. Jena, Germany, 28 Nov. 1889. He was educated at Halle, Giessen, and Berlin, in 1857-67 was private-docent of surgery at Halle, becoming professor of surgery and chief of the hospital at that university in 1867. He was a surgeon in the army during the wars of 1866 and 1870-1, becoming surgeon-general in the latter war. He was eminent as a lecturer, made many important investigations in surgery and pathology, and was among the pioneers in introducing the surgical methods of Lister into Germany. He wrote: 'Traumereien au französischen Kaminen Märchen' (1871; 24th ed. 1894); 'Aus der Burschezeit' (1876); 'Gedichte' (1877); while among his professional writings are: 'Beiträge zur Chirurgie' (1875); 'Be merkungen über einige vom Krebs zu trennende Geschwülste' (1898); etc.

Villon, vò-lòd, Antoine, French painter: b. Lyons 20 April 1833. He studied at Lyons and Paris, and exhibited for the first time at the Salon in 1864. At the following year's exhibition he received a medal, also at the salons of 1868 and 1869. He is remarkable for his technique and although he paints figures and landscapes is pre-eminent in the delineation of still-life—a long neglected branch of art. Among his pictures of this kind are: 'Armor'; 'Curiosities'; 'Sea Fish'; and 'The Pumpkin,' this last being in the collection of William Schau, New York.

Volney, vòl'nè (Fr. vòl-nà), Constantin François de Chassebœuf, Comte de, French author: b. Craon, Anjou, 3 Feb. 1757; d. Paris 25 April 1820. He traveled in Egypt and Syria, and urged upon France the conquest of the former in his 'Considérations sur la Guerre Actuelle des Turcs avec les Russes' (1788). Elected to the National Assembly in 1789, he was imprisoned for opposition to the Terror, and on his release made a tour of the United States, described in 'Tableau du Climat et du Sol des Etats-Unis d'Amérique' (1803). After his return he became senator. His best known work is 'Le Ruines ou Méditations sur les Révolutions des Empires' (1791), a vision of a historico-philosophic sort, in which, near the ruins of Palmyra, representatives of all civilizations and faiths pass by and are reviewed. Consult Berger, 'Etudes sur Volney' (1832); Barni, 'Les Moralistes Français' (1873).

Vologda, vò-lòg-da, Russia, (1) a town, capital of the government of the same name, on the Vologda, in the southwest of the government, in a beautiful district extensively occupied with gardens, 35 miles east-southeast of Saint Petersburg. It consists chiefly of old wooden houses; with a few stone buildings in the modern style in the chief square, and has manufactures of linen, soap, candles, glass, leather, etc. Pop. about 30,000. (2) The government of Vologda in the northeast of Russia, is bounded north by the government of Archangel; east by the Ural Mountains; south by Perm, Viatka, Kostroma, and Yaroslaf; and west by Novgorod and Olonetz; area, 155,498 square miles. The surface consists generally of a plateau covered with woods, lakes, and morasses. The drainage mostly belongs to the basin of the Northern Ocean. The great wealth of the government consists in its forests, which furnish timber and charcoal.

Volsci, vòl'sè, an ancient Italian tribe dwelling in Latium, on both sides of the river Liris (Garigliano). They had a republican government. Their principal city was Corioli, from which Coriolanus derived his surname. After having several times endangered the Roman state, they were conquered and absorbed in the Romans, and thus disappeared from history as a distinct people, like the other tribes of Latium (338 a.c.).

Volok, vòl'sk, or Voljak, Russia, a town in the province of Saratov; on the Volga; 80 miles northeast of Saratov. It has a technical school, normal school, etc., ironworks, and tanneries. Large quays extend along the river, and trade in tallow and skins with Saint Petersburg, in fruit with Nijni Novgorod, and in corn with Astrakhan and Rybinsk, is carried on. A great market is held in autumn.

Volsunga, vòl'soongs, a heroic race celebrated in old German legend. Volsung or Walsung, the grandson of Odin, stands forth as the original ancestor. The most interesting and romantic figure in this line of heroes is Volsung's son, Siegmund. Sigfried or Sigurd, hero of the 'Nibelungenlied,' is of the same race. The old Icelandic Volsungaaga, which has been followed by William Morris in his 'Story of Sigurd the Volsung' contains the original legend.

Volt. See **ELECTRICITY; VOLTA, ALESSANDRO.**

Volta, vòl'tà, Alessandro, Italian physicist: b. Como 18 Feb. 1745; d. there 5 March 1827. In 1777 he paid a visit to Switzerland, where he became personally acquainted with Haller at Bern, Voltaire at Ferney, and De Saussure at Geneva. Two treatises, published in 1769 and 1771, in which he gave a description of a new electrical machine, laid the foundation of his fame. In 1774 Volta became rector of the gymnasium in Como and professor of physics. In 1779 he was transferred from Como to Pavia to fill the chair of natural philosophy in the university of that city. Here he occupied himself entirely with electrical researches. He had previously (1777) invented the electrophorus (q.v.), and his invention of the electroscope (q.v.) (also 1777), was an important improvement. His observations upon the bubbles which arise from stagnant water led him also to some valuable discoveries in regard to gases. The electrical pistol, the eudiometer, the lamp with

inflammable air, the electrical condenser, and other inventions, are among his claims to renown. He next turned his attention to some of the atmospheric phenomena, such as the nature of hail, and subsequently increased his reputation by the invention of the Voltaic pile (1800). In 1782 he had made a tour through France, Germany, England, and Holland. In 1794 he received the Copleian medal from the Royal Society of London, for his paper upon the condenser; and in 1801 his electric apparatus attracted so much notice in France that Napoleon invited him to give an account of his invention before a commission of the Institute, and when the commissioners made their report, proposed that a gold medal should be awarded the inventor in recognition of his services to science. He was also decorated with the cross of the Legion of Honor and the order of the Iron Crown, and was raised to the dignity of senator of Italy, with the title of count. In 1804 he resigned his professional duties. Antinori edited a collection of his works (1816). Consult Mochetti, 'Vita del Conte Volta' (1838).

Volta, West Africa, a river of Upper Guinea, which, rising in the Kong Mountains or highlands behind the Ashanti country, runs south between Ashanti and Dahomey, and reaches the Bight of Benin through the east part of the British Gold Coast at Adda. To left and right of its mouth it forms great lagoons, and on the bar across the mouth a heavy surf runs. With its chief tributary the Black Volta its total length is about 850 miles, 250 of which are navigable in the flood season.

Voltaic Batteries. See PRIMARY BATTERIES.

Voltaic Cell. See PRIMARY BATTERIES.

Voltaic Pile, in electricity, an arrangement in a pile of alternate disks of copper and zinc separated by pieces of flannel moistened with salt water or with water acidulated with sulphuric acid. The voltaic pile gives a very small current; but, its circuit being broken, it shows at its extremities electricity of high tension, and it is capable of sending a current through considerable resistances.

Voltaire, *vôl-târ*, Jean François Marie Arouet, French man of letters: b. Paris 21 Nov. 1694; d. there 30 May 1778. He was destined for the legal profession, but his inclination for literature was so decided that he never seriously entered upon it, and the success of his first tragedy 'Œdipe' brought out in 1718, decided him. It is traditionally recorded that this play was finished, and that two cantos of his 'Henriade' were written in the Bastille, where he was confined (May 1717, to April 1718), on account of certain satirical verses on the regent, the authorship of which was ascribed to him. The success of his tragedy at once made him the fashionable poet of the day, and for the next eight years he resided mainly at Paris. It was about the beginning of this period that he changed his paternal name of Arouet into Voltaire, which latter name is most probably explained as an anagram of Arouet l. j. (le jeune — the younger, he having an elder brother). Voltaire suffered a second imprisonment in the Bastille in 1726, the occasion of which was his sending a challenge to the Chevalier Rohan, by whom he had been insulted. This imprisonment lasted but a month, and on being liberated

Voltaire determined to seek greater liberty in England, whither he had been invited by Lord Bolingbroke. His residence in England lasted till 1729, and during it he acquired a certain knowledge of English literature (Shakespeare, Pope, Swift, Addison), and made himself acquainted with the writings of the English free-thinkers, Toland, Tindal, Collins, Shaftesbury, and others. After his return he lived chiefly at Paris till 1734. In the course of this second Parisian residence he raised himself from very moderate circumstances to a condition of affluence, not, however, by literary labor, but by monetary enterprises in connection with a government lottery, the corn-trade, and army contracts. From 1734 to 1749 his principal place of residence was at Cirey, in Lorraine, where he lived with the Marchioness du Châtelet, with whom he had become intimate in July 1733. The death of the marchioness in 1749 deprived him of this retreat, and in the following year he accepted the often repeated invitation of Frederick the Great to come and live at his court at Potsdam. Here he was received with the greatest honor, but the good understanding between him and the king did not last long, and in 1753, after numerous unpleasant scenes, Voltaire quitted the Prussian court. Before returning to France he visited one or two of the minor courts of Germany. At Frankfort Frederick caused him to be detained in order to recover from him a collection of poems by the king containing a number of satires on several princes, some of which Voltaire had maliciously exhibited at the courts he had visited. Early in 1755 he removed to Geneva, and for the remainder of his life lived mainly either in Switzerland or close to its borders. About 1758 he fixed his residence with his niece, Madame Denis at Ferney, in the Pays de Gex, a district that at one time belonged to the counts of Geneva, and from this time this was his sole place of abode. Under his care the village of Ferney, which in 1758, when the estate in which it lies was acquired by him, contained only 49 peasants in a miserably poor condition, became a thriving place, and in 1776 numbered 1,200 inhabitants, among whom Voltaire lived almost as a sovereign prince. In this retirement he became known to all Europe as the patriarch of Ferney, and received a constant succession of visits from persons of rank and fame, and kept up an immense correspondence, which included in its range most of the crowned heads of Europe. In February 1778, impelled, no doubt, chiefly by the desire of hearing once more the applause of multitudes, he went up to Paris, where he was hailed by all classes with boundless enthusiasm. But the sudden change in his manner of life had an injurious effect upon his health, and there can be little doubt that his death was hastened by the excitement of the occasion. He was buried at the Abbey of Scellières, between Nogent and Troyes, of which his nephew, the Abbé Mignot, was commendator. At the revolution his remains were transferred to the Panthéon (1791).

During his whole life Voltaire was an indefatigable writer. The long list of his productions embraces works in almost every branch of literature: in poetry, the drama, romance, history, philosophy, criticism, and even science. Nearly all his works are strongly animated by a spirit of hostility to the Christian religion and its

representatives. This brought him into conflict with the religious element and the government, and a great part of his later years was spent in exile on account of his extreme and rabid criticism of religious thought and belief. It was mainly in order to be out of reach of the government that he lived so much at a distance from Paris on the frontiers of France, whence he could easily make his escape for a while, when he thought it advisable, into Holland or Switzerland. At Cirey and Ferney he could be more outspoken than he had dared to be when he lived chiefly at Paris. From Ferney he issued all his most direct attacks upon Christianity and Catholicism, the 'Sermon des Cinqante,' 'Extrait des Sentiments de Jean Meslier,' 'La Bible enfin Expliquée.' At the same time he was a chief contributor to the 'Encyclopédie,' and indeed its leading spirit. Yet he had no sympathy with the atheistical views that are found expressed in some parts of that work. He upheld theism with as much zeal as he denounced Christianity and priestcraft, and even came to be looked upon as reactionary by the atheistical spirit of the time. It ought to be mentioned also that his hatred of fanaticism, although often the cause of violence and injustice on his part, was the mainspring of some of the most honorable actions of his life, as in the case of the Calas family. (See CALAS, JEAN.)

The works of Voltaire on which his literary fame is now generally held mainly to rest, are his philosophical novels such as 'Zadig,' 'Candide,' 'L'Ingénu'; his histories ('Siècle de Louis XIV.,' 'Histoire de Charles XII.'). his correspondence, and more than all, perhaps, his poetical epistles, satires, and occasional poems of a light character, in which the typical Frenchman is exhibited in his most complete manifestation, full of wit, gaiety, vivacity, ease, and grace. Several of his tragedies, among which may be mentioned 'Zaïre' (usually reckoned his masterpiece in the dramatic art), 'Alzire,' 'Mérope,' 'Mahomet' (translated into German by Goethe), and 'Rome Sauvée,' had great success in their own day, but the French do not assign to them a high place in their literature. Voltaire attempted comedy also, but in this he was still less successful. He seems to have been almost entirely deficient in the comic faculty. The best of his comedies is 'L'Enfant Prodigue.' We should not omit to mention that Voltaire was always a great lover of the drama, and that wherever he settled for any length of time one of his first aims was to get a theatre established in the place, sometimes in his own house. Occasionally he acted himself. The 'Henriade,' an epic poem, with Henry IV. of France, as hero, is another work of his, which, though not highly esteemed now, had great success, and exercised a powerful influence when it first appeared. Of the numerous editions of the works of Voltaire, the best are those of Beaumarchais, with introductions and notes by Condorcet (1784-90), Beuchot (1828 et seq.), and Moland (1877-85). The chief biographies are those by Desnoiresterres, 'Voltaire et la Société Française au XVIII. Siècle' (2d ed. 1887); Mahrenholtz, 'Voltaire's Leben und Werke' (1885); Parton, 'Life of Voltaire' (1881); Hamley, 'Voltaire' (1877); Ballantyne, 'Voltaire's Visit to England' (1893); and Espinasse, 'Voltaire' (1892). Consult also D. Strauss

'Voltaire: Sechs Vorträge' (1870); John Morley, 'Voltaire' (1872); Maugras, 'Voltaire et Jean Jacques Rousseau' (1886); Rabaud, 'Etudes Historiques sur l'Avènement de la Tolérance' (1892); Campardon, 'Documents Inédits sur Voltaire' (1893); Deschanel, 'Le Théâtre de Voltaire' (1886); Lion, 'Les Tragedies et les Théories Dramatiques de Voltaire' (1896); Lounsbury, 'Shakespeare and Voltaire' (1902); Calmettes, 'Choiseul et Voltaire' (1902).

Vol'taism, in physics, a term applied to galvanism, from the fact that Volta's explanations of Galvani's experiments on frogs led to the correct appreciation of the sources of the electricity so generated.

Voltam'eter, in electricity, an arrangement which shows the quantity of electric current which is passing through its circuit in terms of a quantity of water decomposed. The figure shows the voltameter to the left connected with a battery. A circular vessel has two wires let through its bottom, which bear inside two pieces of platinum foil as shown; water slightly acidulated with sulphuric acid is poured into the vessel, and two tubes which have been filled with

Voltameter.

water are placed one over each strip of platinum or electrode. On the poles of the battery being connected with the exterior ends of the wires by means of binding-screws, water will be decomposed, and hydrogen will appear in one tube and oxygen in the other. It will be found, as represented in the figure, that more than twice the quantity of water is displaced in the hydrogen tube than in the oxygen tube. Two volumes exactly of hydrogen and one volume of oxygen are the proper proportions to form water; but some of the liberated oxygen is dissolved by the water.

Volterra, vól-tër-rā, Daniele da (RICCIARELLI, DANIELE) Italian painter: b. Volterra, Italy, 1509; d. Rome 4 April 1566. He studied painting at Siena, and afterward went to Rome, where he gained the friendship of Michelangelo, who not only instructed him, but gave him designs for some of his works. His fame rests chiefly on a series of frescoes in the Church of La Trinità de' Monti, Rome; and of these the 'Descent from the Cross' is well known by Toschi's engraving. He was employed by Paul IV. to drape the figures in Michelangelo's 'Last Judgment' and thus earned for himself the

soubriquet of "Il Braghettono" (The Breeches-maker). In the latter part of his life he applied himself also to sculpture.

Volturmo, vól-too'r'nò, Italy, a river which rises in the province of Campobasso, flows southeast to its junction with the Calore, and then west past Capua into the Mediterranean, 20 miles southeast of Gaeta, after a course of 112 miles. Garibaldi won a victory over the army of the king of Naples on its banks in 1860.

Volume, the bulk occupied by a body. The volume of a body may be "real" or "apparent"; the real volume being the space occupied by the actual substance of which the body is composed, after making allowance for the pores or interstices that may be present; while the apparent volume is the space included within an imaginary surface which just takes in the body, interstices and all. The "apparent volume" of a heap of coal, for example, includes the "real volume" of each separate fragment of the coal, and also the empty spaces between these fragments, as they lie in the pile. See **MENSURATION**; **WEIGHTS AND MEASURES**; **METRIC SYSTEM**; **UNITS**.

Volume, Molecular or Specific, a value obtained as the quotient of the molecular weight of a compound body divided by its specific gravity.

Volumetric Analysis. See **CHEMICAL ANALYSIS**.

Volumometer, an instrument for determining the specific gravity of a solid by measuring the amount of water or other liquid displaced by it. A simple form is a flask having a long narrow neck, and an opening at the side through which the solid may be introduced. The neck is graduated from the bottom upward. The method of using it is as follows: The flask is filled to the zero mark with some fluid in which the solid is not soluble; on turning it on its side the stopper can be removed and the solid introduced; when turned back to an upright posture again the liquid is forced up the stem and the volume reading is the amount of liquid displaced by the solid. From this the specific gravity can be easily calculated.

Voluntary Controversy, a controversy begun in Scotland in 1780, and which continued obscurely until 1831, when it began to excite general interest, resulting at length in disruption of the Scottish Presbyterian Church, and to that remarkable action, by which, as a protest against state interference, on Tuesday, 23 May 1843, 396 ministers and professors renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant and consenting that they should be dealt with as such. By this memorable act of self-sacrifice in obedience to principle these ministers and teachers gave up an annual income amounting to at least \$500,000. See **FREE CHURCH**.

Voluntaryism, or The Voluntary System, a term applied to the support of ministers of religion and their churches by the voluntary contributions of the people, as opposed to the connection of church and state, and the support of the ministry from tithes or general taxation. Whenever the clergy receive stipends from the state, it is evident that the taxpayer, in addition to the voluntary support, if any, which he gives to some particular church, contributes through

taxation to the support of an established church, or of state-recognized churches in general.

In ancient times state and church were inseparable, and opposition to the church was regarded as treason to the state. This relation existed throughout the Middle Ages, and until a comparatively recent period, under the papacy, with the important difference that the state was regarded and treated as subordinate to the church, and as bound to obey its decrees. In the countries which accepted the Protestant doctrines in one form or another the relations of church and state were reversed, and the state, as represented by the sovereign, assumed control of the church, a fact which had much to do with the spread of the Reformation. While the conditions of the connection were changed, however, the tie between church and state became, in Protestant countries, even stronger than before, an ever-present and jealous monarch uniting in his own person the hereditary civil power of the crown, and the religious authority which had formerly been exercised by a distant pope. Dissenters from the established church became rebels, whereas before they had only been heretics, and the devastating civil wars of the 16th and 17th centuries were the outcome, in a large, if not a principal degree, of this new relation.

The dissenter from a church establishment did not seek to put a voluntary system in its place. If he triumphed in England or immigrated to America his aim was to create an established church of his own, and doom to stake or scaffold any intruder who disagreed with him. The colonies of Rhode Island and Maryland, the former founded by Protestants, the latter by Roman Catholics, were framed on the plan, then novel to the world, of toleration in matters of conscience, accompanied by its correlate, the voluntary system.

While the world has made admirable progress toward complete liberty of conscience, while the prison and scaffold no longer menace dissenters from an established creed, and men can be friends, and acknowledge each other's good qualities although differing pole-wide—to use Whittier's expression—in religious opinions, the voluntary system is still almost confined to the United States, Mexico, and the leading British colonies. State-supported churches are the rule, even in France and Germany, where all creeds are on an equal footing; in Switzerland, where absolute liberty of conscience is decreed by law, the magistrates keep a certain degree of supervision over religion, and Brazil, while providing in her constitution for absolute separation of Church and State, still supports the ecclesiastics who were in receipt of state support when the new relation came into force.

In the United States, saving the fact that church property is usually exempt from taxation, the voluntary system prevails everywhere, and only chaplains in the army and navy, and those who say prayers before public bodies, as at the opening of the United States Senate, receive pay from the public treasury. This universal voluntaryism did not come about with independence, or even with the adoption of the Federal Constitution. The first amendment to the Constitution of the United States provided that Congress should make no law respecting an establishment of religion, or prohibiting the free exercise

VOLUNTEERS—VOMITING

thereof. This, of course, did not affect the power of the several States to create or continue church establishments. The convention which framed a constitution for Massachusetts provided in the "Bill of Rights," that "the legislature shall authorize and require the several towns, parishes and precincts to make suitable provision at their own expense for the institution of the public worship of God, and the support and maintenance of public Protestant teachers of piety, religion and morality, in all cases where such provision shall not be made voluntarily." Officers known as tithingmen were appointed to collect the dues, and if a taxpayer defaulted, distress and even imprisonment followed. This system amounted to state support of the Congregational Church, and it was not until 1815 that dissenters from the prevailing creed were released from paying taxes to maintain the ministers of the majority. The involuntary system was abolished altogether in Massachusetts in 1833. In Connecticut the Constitution of 1818, while giving every society of Christians power to tax the members of such society, permitted any member to escape this obligation by giving notice of withdrawal in writing. And now, as for many years past, without any provision of the Federal Constitution to coerce the States, and by force of enlightened public opinion, voluntarism in the maintenance of ministers and churches prevails everywhere throughout the republic, and in no country in the world is religion better supported, while the clergy also, conscious of their freedom from state control, are self-respecting in their personal attitude, and devoted to the service of God and of their flocks.

Volunteers, a name applied to the citizens of a state or nation who of their own accord offer their services in a military capacity without the stipulation of a substantial reward. In all the American wars from the Revolution to the Spanish-American war, there were volunteer soldiers, companies and regiments. These were generally amalgamated with regular troops when it was found their services were available. In Great Britain in 1794 and again in 1803, when the threats of France agitated England, nearly the whole of the available male population was formed into volunteer companies, and the government at one time reckoned upon having nearly 500,000 efficient volunteers in arms. The numbers soon declined, and in 1815 the force almost ceased to exist. About 1857 a feeling of insecurity began to manifest itself in consequence of the alleged insufficiency of the national defenses, and the Victoria Rifles in London and one or two other corps were formed. In a short time the movement began to spread; in May 1859, the formation of volunteer corps of riflemen commenced under the auspices of government, and by the end of the year many thousands were enrolled. After four years' preliminary experience an act of Parliament relating to the force was passed in 1863; another was passed in 1869, and these, with subsequent acts and regulations, constitute the law relating to volunteers. The Volunteer Acts of 1866 and 1900 regulate offers by volunteers for actual military service outside Great Britain; and in the South African War a number of volunteers took part with great credit to themselves. There are also considerable numbers of volunteers in India, Canada, Australia, etc.

Volunteers of America, The, a religious body organized from former members of the Salvation Army (q.v.) in 1896 by Commander and Mrs. Ballington Booth and consisting of six regiments, embracing nine companies or central societies and nearly 100 self-supporting posts, not including outposts. The head officer is elected by the members as commander-in-chief, and by the directors as president. There are four branches of philanthropic work: (1) The sociological branch, which provides homes for destitute men. In 1903 the 10 homes located in various cities furnished lodging for 200,000 persons. (2) The Home of Mercy, branch for friendless young women maintaining one home in Newark, N. J., and one in Boston, Mass. (3) The tenement work for the worthy poor. (4) The philanthropic branch, working among unprotected children. The Prison League is an important department of volunteer activity. In 1910 there were branches in 20 States, embracing 7,500 prisoners and corresponding with 19,000 men. There is an aggregate annual attendance of 1,500,000 persons at the hall meetings and 2,000,000 at the open air meetings.

Volutes, *Florientum*. See **WILSON, FLORENCE**.

Volute, a spiral scroll used in Ionic, Corinthian, and Composite capitals, of which it is a principal ornament. The number of volutes in the Ionic order is four. In the Corinthian and Composite orders they are more numerous, in the former being accompanied by smaller ones, called helices; called also *voluta*. See **ARCHITECTURE**.

Volute Wheel, a volute shaped wheel that in revolving presents its open mouth to the air, which is thus gathered into the tube and discharged through the hollow axis. It is a common and effective sort of blower. Also, a water-wheel with radial or curved buckets, in which the periphery of the wheel is surrounded by a volute-shaped casing or scroll.

Volvox, a minute aquatic plant (*Volvox globator*), in the form of a pale green globule floating about in the water. Under the microscope it is seen to be a spherical membranous sac, studded with innumerable green points giving exit to cilia, which enable it to roll over and over in the water. Within the sac are various dense globules, generally green in summer, but often of an orange color in autumn and early winter. They are zoospore-like bodies, each sending a pair of cilia through separate orifices. There is a reddish brown spot and a contractile vacuole.

Vo'mer, one of the bones of the skull. See **HEAD; SKULL**.

Vomiting, the ejection of matter from the stomach through the mouth, mainly by spasmodic contraction of the abdominal muscles, assisted by the active co-operation of the muscular walls of the organ; the diaphragm remains fixed, affording a firm surface against which the stomach is pressed by the abdominal muscles. Relaxation of the sphincter at the cardiac orifice of the stomach is necessary, as its contraction will resist the power of all the expulsores muscles combined, explaining the violent and vain efforts to vomit so commonly seen and experienced; the act is preceded by a deep inspiration, the glottis being spasmodically closed during the paroxysm.

VONDEL — VOORSANGER

It may be produced by irritating substances applied to the mucous membrane of the stomach, the impression being conveyed by the pneumogastric nerves and the motor nerves of expiration, as in common emetics, by irritations in other parts of the body, transmitted by reflex nervous action, as in strangulated hernia, the passage of calculi, and during gestation; and by impressions received through the sensorial centres, whether emotional or sensational, as from tickling the fauces, disgusting sights or odors, and in seasickness; even the recollection of these sensations may cause vomiting in very impressionable persons. It is a common symptom of many diseases of the stomach and intestines, and arises from sympathy in affections of many other organs; it is sometimes nervous or spasmodic. Exclusive of the treatment proper for the special disease of which it may be the symptom, effective remedies for vomiting are ice, effervescing potions, mercurials, prussic acid and various narcotics, creosote, chloroform, and ether. In many birds and some mammals, the contents of the stomach are ejected as a means of offense, as in the petrels and vultures, and the llama. Vomiting is usually more easily induced in children than in adults. It is a frequent accompaniment of pregnancy (see OBSTETRICS), and is often prominent in disease of the kidneys (q.v.), tuberculosis (q.v.), etc. Vomiting is in many cases entirely salutary, and in such cases is to be encouraged and assisted.

Vondel, von'del, Joost van den, Dutch dramatic poet: b. Cologne 17 Nov. 1587; d. Amsterdam 5 Feb. 1679. His parents, who were Anabaptists, removed to Holland while he was a child, and the poet afterward adopted the Arminian faith, but finally died in the bosom of the Roman Catholic Church. Nature had endowed him with extraordinary talents, and he derived little aid from education. Devoting himself entirely to the cultivation of Dutch poetry, Vondel first learned Latin and French in the 30th year of his age. His works display genius and elevated imagination, and embrace lyric and didactic poems, satires, an epic, and some 30 tragedies, some of which are founded on biblical subjects and bear such titles as 'Lucifer,' 'Noah,' 'Jephtha,' etc. These enjoy a high reputation in Holland, and the interspersed choruses may be regarded as the finest lyrical productions of the Dutch muse. The best collective editions of his works are those by Jan van Lennep (1850-69) and Unger (1890 onward). The dramatic poem 'Lucifer' (1654) is his greatest work and by some critics is supposed to be the source of the inspiration of Milton's 'Paradise Lost,' but this may reasonably be doubted. English translations of Vondel's 'Lucifer' (1898); 'Samson' (1903); and 'Adam' (1903) have been made by C. Van Noppen (q.v.). Consult 'Lives' by Baumgartner (1882); Haek (1890); Looten, 'Etude littéraire sur Vondel' (1889); Müller, 'Ueber Miltons Abhängigkeit' (1891).

Von Holst, fön hölst, Hermann Eduard. See HOLST, HERMANN EDUARD.

Von Mannlicher, fön män'tlic-ër, Ferdinand. See MANNLICHER, FERDINAND VON.

Von'noh, Robert William, American artist: b. Hartford, Conn., 17 Sept. 1858. He studied at the Massachusetts Normal Art School, Boston, 1875-9; was instructor there in painting

and drawing, 1879-81; in 1881-3, and again from 1886 to 1891, studied in Paris, teaching in the interval at the Museum of Fine Arts, Boston. He acquired a manner in which realism and impressionism are emphasized by dramatic effects and boldness of treatment in light, color, etc. Whether in portrait, figure, or landscape painting, his work has individuality and interest, and his success particularly as a portrait-painter has been marked. From 1891 to 1896 he was principal instructor in portrait and figure painting at the Pennsylvania Academy of the Fine Arts. He has exhibited much in this country and in Europe. Among his works are: 'Sad News'; 'Miss Mildred Blair'; 'Little Louise'; etc.

Voodoo'. See Voodoo.

Voorhees, voor'ez, Daniel Wolsey, American legislator: b. Liberty, Ohio, 26 Sept. 1827; d. Washington, D. C., 10 April 1897. He was graduated from Indiana Asbury (now De Pauw) University in 1849, admitted to the bar in 1851, and engaged in law practice at Covington, Ind. In 1858-61 he was United States district attorney for Indiana, and he was attorney for the defense of John E. Cook during the latter's trial for participation in John Brown's raid. He was member of Congress in 1861-6 and in 1869-71, and from 1877 to a few months before his death, United States senator from Indiana. He was a member of the finance committee throughout his entire career in the Senate, and an advocate of the free and unlimited coinage of silver until 1893 when he cast his vote to repeal the silver-purchase clause of the Sherman act. He was largely instrumental in securing the erection of the Congressional Library building, and was noted as an orator.

Voorhees, Philip Falkerson, American naval officer: b. New Brunswick, N. J., 1798; d. Annapolis, Md., 26 Feb. 1862. He was appointed midshipman in the navy in 1820, served in the War of 1812, participated in the capture of the Macedonian and the Epervier, and received a Congressional medal of honor for his services. He attained rank as captain in 1838 and was assigned to command the Congress, in which capacity he captured, in 1844, an Argentine squadron and an allied cruiser which had fired on an American ship. His action was commended in home and foreign diplomatic circles, but he was tried by court-martial. His course was vindicated and in 1847 he was assigned to command the East Indian squadron, a position equal to the rank of rear-admiral, which had not then been established in the United States navy. He was placed on the reserve list in 1855, an action against which he appealed to President Buchanan as unjust. A decision favorable to Voorhees was rendered by Attorney-general Black and he was restored to the leave pay-list.

Voorsanger, foor'sáng'ër, Jacob, American rabbi and educator: b. Amsterdam, Holland, 13 Nov. 1852. Taught at the theological seminary of his native city, he came to the United States about 1870, and was rabbi at Philadelphia (1873-6), Washington, D. C. (1876-7), Providence, R. I. (1877-8), and Houston, Texas (1878-86). Since 1886 he has been rabbi of Temple Emanu El, San Francisco, Cal. He edited 'The Sabbath Visitor' for three years,

besides making numerous contributions to leading Jewish weeklies. In 1884 he was elected professor of Semitic languages at the University of California. He has written: 'Moses Mendelssohn, Life and Works'; 'Chronicles of Emanu El.' He founded in 1895 a weekly, 'Emanu El,' which he continues to edit.

Voronezh, vó-ró-nězh, Russia, (1) The capital of a government of same name, on a height above the Voronezh, near its confluence with the Don, 290 miles south-southeast of Moscow. It consists of a high town, a low town, and three extensive suburbs — is well built, and has a cathedral, an episcopal palace, town-house, gymnasium, diocesan seminary, arsenal, hospital, and poorhouse; manufactures of woolen and linen cloth, soap, and vitriol, numerous tanneries, a considerable trade in corn and tallow, and important fairs and markets. Voronezh has interesting associations of Peter the Great, and of the poets Nikitin and Koltsoff. Pop. about 90,000. (2) The southern government of Voronezh has an area of 25,443 square miles. It is intersected by the Don, which receives the whole of the drainage, partly through its tributaries, the Voronezh and Khoper. The soil is generally fertile, and large crops of grain are raised. The breeding of horses and sheep is an important industry. Manufactures are considerable, and there is an extensive trade. Pop. about 2,700,000.

Vörösmarty, vé-rěsh-márt-y, Michael, Hungarian poet; b. Nyék, comitat of Stuhlweissenburg, 1 Dec. 1800; d. Budapest 19 Nov. 1855. He studied in Pest, practised for a time as an advocate, in 1848 was a member of the National Assembly, and was twice imprisoned for political reasons by the Austrian government. A memorial to him was placed at Stuhlweissenburg in 1866. Among his poems and dramas were: 'King Solomon' (1821); 'The Victory of Faithfulness' (1823); 'Zalán's Flight' (1825); 'Csérholom' (1826); 'Erlau' (1828); 'Csongor and Tünde' (1831); 'Barnus Mardó' (1838). Gyulai prepared a collective edition (1864; 2d ed. 1884) and a biography (1864; 4th ed. 1896).

Vorse, Albert White, American editor b. Littleton, Mass., 18 Aug. 1866. He was graduated from Harvard in 1889, was connected with the Philadelphia Press 1891-3, the New York Mail and Express 1894-6, and subsequently with the 'Illustrated American' and the 'Criterion' 1899-1901. He has published 'The Laughter of the Sphinx' (1900).

Vortex, a whirlpool or eddy; any fluid rotating around an axis. The name is applied to pools, waterspouts, whirlwinds, and on a larger scale in cyclones and storms generally. Descartes supposed certain vortices to exist in the ether of space endowed with a rapid rotatory motion and filling all space, and by these he accounted for the motions of the universe.

Vortex Atom. See VORTEX MOTION.

Vortex Motion. The motion of a mass of fluid (including under this term gases and liquids) is known if the motion of every infinitesimal portion, or particle, of the mass is known. The motion of a particle is investigated by referring the successive positions it occupies in its journey to a set of three straight lines, or axes, which pass through the same point and are mutually rectangular. With respect to these

axes the motion of the particle may assume either one of two characteristic types. It may move without rotation about either of the axes, or it may move with rotation about one or more of the axes. The former type is called irrotational motion, and the latter type is called rotational motion, or vortex motion. The vortex type of motion is by far the more common in nature and manifests itself in an infinite variety of ways. One of the most striking examples of vortex motion is seen in smoke rings emitted occasionally by locomotives and other high pressure steam-engines when exhausting slowly. Similar and more definite rings are easily produced also by devices now common in physical laboratories. Helmholtz, who was the first to investigate the theory of vortex motion, showed that vortex rings and filaments, or combinations thereof, in a perfect liquid (which is an ideal frictionless fluid of constant density) are indestructible. Extending this idea to perfect fluids, Lord Kelvin has imagined that the atoms and molecules of physical science may be vortex rings or filaments, or combinations thereof, in the ether. For the theory of vortex motion and references to the literature of the subject, consult Lamb, 'Hydrodynamica.'

Vortex Ring. See VORTEX MOTION.

Vorticella, vór-ti-sél's, a family (*Vorticellidae*) of attached or free forms of peritrichous ciliates, in which the adoral zone of cilia, where seen from above, forms a right spiral (dextro-tropic), while a secondary circlet of cilia near the aboral end may be either permanent or transient. The true vorticellids, represented well by the common bell-animalcule, are without a permanent second circle of cilia, and the peristome may be completely included within a peristome fold which contracts sphincter-like about it. The stem is either firm and constant in length, or flexible and capable of being contracted suddenly when it becomes a short close spiral. The individuals also are mounted on a single unbranched stalk or grouped on a common branching stalk in colonial existence. The simplest type of reproduction is longitudinal division, which may result in producing two individuals in a branched stalk, or one of the two may become detached and, propelled by a newly-formed circle of cilia near the basal end, lead a free existence for a time. Soon the free form settles down and develops a stalk. Conjugation has been observed and always takes place between a stalked form and a free-swimming form produced by budding. The bell-animalcule has long been a favorite object of microscopical study from its abundance and easily observed structure and activities. Ehrenberg (1838) made an extensive study of these organisms, and maintained that they possessed the complete organ systems of higher forms. The demonstration of their unicellular nature necessitated the abandonment of this view. The group is rich in number and variety of species.

HENRY A. WARD,
University of Nebraska.

Vortigern, vór-ti-gěrn, a semi-mythical British king of the 5th century, who, according to Gildas, Bede, Ethelwerd, and the 'Old English Chronicle,' invited Hengist (q.v.) and Horsa to assist him against his enemies the Picts and Scots. Whether invited by Vortigern or not, the newcomers are said to have turned

against him and wrested from him the Kentish territory. There is something like unanimity in the chroniclers regarding Vortigern's character. They make him tyrannical and licentious. It is to be presumed that he came to a violent end in conflict with the invaders who had established themselves in his dominions.

Vos, vds, Geerhardus, American Presbyterian theologian: b. Heerenveen, Holland, 14 March 1862. He was educated at the seminary of the Holland Christian Reformed Church at Amsterdam and at Princeton Seminary, and was professor of theology in the former institution 1888-94, and since the year last named has held a similar post at Princeton. He has published 'The Mosaic Origin of the Pentateuchal Codes' (1886); 'De Verbondsleer in de Gereformeerde Theologie' (1891); etc.

Vos, Maarten de, Flemish painter: b. Antwerp 1532; d. there 1603. He studied in Antwerp under his father, Pieter de Vos, and De Vriendt, and at Venice under Tintoretto, established a school of painting in his native city in 1558 and became one of the most popular artists of his day, hundreds of engravings of his paintings and drawings being made. Among his works are 'The Triumph of Christ'; 'Cæsar's Penny'; 'The Marriage at Cana,' in the cathedral at Antwerp; 'Saint Luke Painting the Portrait of the Virgin.' He is sometimes styled 'the Elder,' in distinction from his son Maarten (b. 1576; d. 1613), also an artist.

Vooges, vdzh, a European chain of mountains about 100 miles long, partly on the frontiers of France and the German territory of Alsace, partly in Alsace, extending from north-northeast to south-southwest, nearly parallel with the Rhine, and forming a continuation of the Jura Mountains, which separate France from Switzerland; the breadth varies from 20 to 45 miles. The highest summit, Ballon-de-Guebwiller (the summits are generally called ballons), has a height of 4,685 feet above the surface of the sea. The Vooges Mountains have a gentle declivity, and on the eastern and southern sides are covered with vineyards. Great part of the Vooges is densely wooded, and, besides abounding in game, they possess great mineral wealth, including silver, copper, iron, lead, coal, and antimony. They also contain excellent pasturage; and the inhabitants breed many cattle. The Ill, Lauter, Moselle, Meurthe, Saar, and Saône rise in this chain of mountains.

Vooges, France, an eastern department bounded on the north by the departments of Meuse and Meurthe, on the east by Alsace, on the south by the departments of Haute-Saône, and on the west by Haute-Marne; area, 2,303 square miles; capital, Epinal. The department derives its name from the mountain-chain which bounds it on the east, and sends out ramifications over the greater part of its surface. Its south portion is traversed east to west by the chain of the Faucilles. In the lower grounds, on an elevated but tolerably flat tract, grain, hemp, flax, and potatoes are extensively raised. The wine produced is indifferent, but the department has long been famous for its kirsch-wasser made from the produce of extensive cherry-plantations. The principal rivers are the Meuse, Mouzon, Madon, Moselle, Saône, and Meurthe; but none of them are navigable within

the department. The minerals include argentiferous lead, copper, iron, antimony, cobalt, marble, millstones, slate, kaolin, and fine agates. The chief manufactures are the famous Gêrome or Munster cheese, cotton and linen cloth, lace, musical instruments, turnery and wooden clogs, nails, iron, steel and iron ware, paper, leather, pottery, and glass.

Voss, fds, Johann Heinrich, German poet and translator: b. Sommersdorf, near Waren, Mecklenburg, 20 Feb. 1751; d. Heidelberg 29 March 1826. He early began to write verses, and some of these contributed to the 'Göttingen Musenalmanach' led to a correspondence with Boie, upon whose invitation he went in 1772 to Göttingen. Here he studied the classical and modern languages, and was one of the founders of the Göttinger Dichterbund. The editorship of the 'Musenalmanach' was handed over to him by Boie in 1775; in 1778 he was made rector of Otterndorf in Hanover, in 1782 at Eutrn. In 1781, after the publication of several treatises, he produced his German 'Odyssey,' a work which has rendered this grand poem national with the Germans (new ed. by Bernays 1881). This has been called 'the most perfect rendering of Homer into a modern tongue.' In 1793 appeared his translation of the 'Iliad,' and that of the 'Odyssey,' in a new form, in which, however, it did not please so much as before, the former displaying greater truth and naturalness. He published in 1795 an idyl in the epic form called 'Luise,' printed first in 1783, but now produced with improvements. His translation of the whole of 'Vergil' (1799) was revised for the edition of 1822. In 1805 he went as professor to Heidelberg, where he remained till his death. Voss rendered good service to the study of classical antiquity, and threw fresh light upon many subjects. As a translator he exhibited wonderful command of language and great skill in the handling of metres. Among his translations that of Homer's works is undoubtedly the greatest; we may also mention, in addition to his 'Vergil,' his 'Hesiod' (1806); 'Horace' (1806); 'Theocritus, Bion and Moschus' (1808); 'Aristophanes' (1821); 'Tibullus' (1820); 'Propertius' (1830); and selections from 'Ovid' (1798). He also undertook, with his sons, a translation of Shakespeare, which was completed in nine vols. in 1820, but this translation cannot stand a comparison with Schlegel's. Consult lives by Paulus (1826); by Herbst (1872-6); Prutz, 'Der Göttinger Dichterbund' (1841).

Vote. See **BALLOT**.

Voting Machine. The wave of ballot reform which swept over the United States of America immediately after the year 1888 firmly established the Australian or blanket ballot as a factor in the elections of practically all of the States of the United States of America. This ballot was intended to encourage freedom of choice on the part of the voters, and while it seemingly makes it easy to split the ticket (or to cast an independent ticket) it oftentimes disfranchises the voter because of his mistake in marking it. The introduction of the Australian ballot opened the way for voting machines and demonstrated the need of them. The voting machine is a mechanical Australian ballot, having for its object the correcting and preventing of the abuses to which the Australian ballot sys-

VOTING MACHINE

tem is susceptible, and expediting the returns; it accords to each voter his full voting privilege, it prevents him from making mistakes that would take his ballot out of compliance with the law, and makes it unnecessary for the judges to inspect the ballot to determine its legality. The machine counts the ballot for each candidate at once, making it a part of the total vote. When a vote is cast, the operating devices are automatically reset and the machine is again ready for operation by another voter. Machines include safeguards against frauds by election officers. They make it more easy for the voter to accomplish his work, and prevent him to a great extent from making a partial or complete failure in voting. The use of them compels secrecy, reduces the amount of labor involved on the part of election boards, secures greater economy in the expenses of election, and gives the returns at once on the closing of the polls.

The Requisites of a Complete and Legal Voting Machine.—A voting machine must enable a voter to cast his vote in secret; that is, so that no one can see or know for whom he has voted.

The method of voting must be simple, and within the comprehension of all classes; so that illiterate or blind persons, after receiving instruction, can vote without assistance.

It must be convenient in its operation.

It must permit a voter to vote for all of the candidates nominated by any party, or to vote in part for the candidates of one party, and in part for the candidates of other parties, and provide for voting for persons who are not nominated by any party, for any office.

It must give the voter perfect freedom in his selection from any of the candidates without regard to their position on the machine. For some offices, but one candidate is to be voted for; for others two or more may be nominated by each party.

It must be beyond the power of the voter to vote for more persons than he is entitled to vote for, or to vote twice.

It must permit a voter to change his vote, or correct a mistake, while he is in the booth.

It must permit a voter to split his electoral vote.

It must permit voting on questions.

It must permit limited or restricted voters (females or others) to exercise their rights under the law, but not to exceed them, either for candidates or questions.

It must count, positively and accurately, every vote cast.

It must prevent defective ballots.

The counters should be so placed, that they can be conveniently examined before and after the election.

All the moving parts should be controlled by locks, so that the register of the vote shown on the counters cannot be changed, thus maintaining a permanent record during the time prescribed by law.

The voting machine must be so constructed that it cannot be unlawfully manipulated by anyone, under conditions that prevail in elections legally conducted.

It must be able to bear the most rigid scrutiny of expert mechanics and others qualified to judge of the merits of such mechanism.

There must be simple and positive action

of the working parts, which must be so related that if misplaced by the voter either by accident or design, no injury will result from the further operation of the machine.

Extent of Use.—The first voting machine built and actually used in an election was the Myers Voting Machine; the invention of Jacob H. Myers; it was used in the election of the town of Lockport, N. Y., in 1892, and attained considerable use elsewhere in that State. This machine was legalized in the State of New York, as well as the States of Connecticut and Michigan. Afterward improved machines began to make their appearance. The inventions of Sylvanus E. Davis and Alfred J. Gillespie resulted in the Standard and U. S. Standard Voting Machines, which have attained the greatest use and perhaps the greatest celebrity in the voting machine art. These machines are used extensively in the States of New York, Connecticut, Wisconsin, Michigan, Indiana, New Jersey, and California. They are the only method of conducting elections in 24 cities and 272 villages in the State of New York. The election for the entire city of Rochester, N. Y., in 1898 was held by 73 of these machines and the election was the first complete and convincing demonstration of the practicability of using voting machines on a large scale.

In Buffalo, N. Y., these machines have been used in the elections since 1899; the returns from all of the 108 election districts with over 60,000 voters have been received and tabulated at the City Hall in 35 minutes, and papers sold on the streets within one hour after the closing of the polls, although the ticket was of considerable size, containing some 150 candidates.

The U. S. Standard Machine.—The U. S. Standard Voting Machine has an upright keyboard, on which the party rows of candidates and keys therefor are arranged in horizontal lines with the lines of the offices transverse thereto. At the end of each party row a lever is provided by means of which all of the keys of that party row may be moved together to a voting position over the names of the candidates nominated by that party; or the keys may be moved separately to a voting position over the names of the candidates for which the voter desires to vote. Before the voter can arrange his ticket he must enter the booth by closing the curtain around him to shield himself from the public, after which he pulls either a party lever for straight ticket voting or a releasing lever, to unlock the keys to enable him to prepare his ballot independently. The machine affords the voter an opportunity to cast a straight party ticket, to split his ticket, to correct mistakes, to vote for candidates not in nomination and gives him all facilities to cast only a legal vote, which is sure to be counted as he indicates. If constitutional amendments or questions are submitted to the people, they can be voted on, provisions being made to vote "yes" or "no" on all such questions or amendments. By opening the curtain the voter counts his vote and sets the machine for the next voter. The total vote for each candidate and question is given at once at the close of the election. The machine is also equipped with lockouts which are operated by the election officers to prevent particular voters from voting for offices or on questions on which they are not entitled to vote.

The machine is provided with a protective counter which counts up to 1,000,000 and cannot be reset, and reliably indicates whether the machine has been operated or changed after it has been prepared for an election, or after the close of an election.

The Abbott Machine.—The Abbott Machine has had some use in the State of Michigan, being legalized by the laws of that State. It has all of the candidates for one office mounted on a slide, which can be adjusted according to the wishes of the voter. He can move the office slides to the right or to the left, so as to bring the name of the candidate desired into line with the operating bar, by the operation of which the vote is registered on counters. The machine is limited, however, in that it cannot group; that is, provide for the voting for two or more candidates on one office line, which is always necessary when two or more candidates are to be elected to an office.

The Bardwell Machine.—The Bardwell Machine, which has been used to a limited extent, has the candidates arranged in office lines and party rows. When the voter enters the booth, he is furnished with a key which he inserts in the key-hole belonging to the candidate he wants to vote for, and turns it half way around. This counts a vote for that candidate and locks the other candidates for the same office from receiving a vote, and by repeating this operation on other office rows the voter is enabled to cast his vote as he desires for the whole ticket. In case he has made a mistake by casting a vote for the wrong candidate, he can withdraw this vote by again inserting the key in its key-hole and turning it backward. Straight party tickets are counted on separate counters, the operation of which, by the voter, locks the balance of the counters against operation, but the total of the counters must be added to the counters of the candidates of that party at the end of the election. CARL F. LOMA,

United States Standard Voting Machine Co.

Voodoo', or Voodoo, a common name applied by the negroes of the West Indies and the United States to certain superstitious rites and beliefs brought originally from Africa. In the Southern States, before the Civil War, voodooism was generally practised among the slaves, and voodoo doctors were common. Many of these doctors were skilful poisoners, and while the great mass of their professed art was a rank imposture, still they possessed enough of devilish skill to render them objects of wholesome dread. Their services were more often invoked in destructive than in curative offices. If a negro desired to destroy an enemy, he sought the aid of the voodoo, who, in many cases, would undertake to remove the obnoxious one, and the removal was generally accomplished through the medium of poison. No doubt exists that in many cases the victim of a voodoo died from sheer fright, for whenever a negro had reason to think that he was possessed by the spell of the voodoo, he at once gave up all hope, thus hastening the accomplishment of the end toward which the energies of the sorcerer were directed. Their incantations and spell workings were always conducted with the greatest secrecy, no one being allowed to witness the more occult and potent portion of their ritual.

VOL. 22—3

Vouet, voo-è, Simon, French painter: b. Paris 9 Jan. 1582; d. there 30 June 1649. At 14 he went to London where he was already able to make a living by his art, and going to Constantinople in 1611 obtained many commissions there. The next year he studied the works of Paul Veronese at Venice and was later made president of the Roman Academy, but was presently recalled to Paris and made court painter by Louis XIII. The progress of French art was much advanced by him, and among noted pupils of his were Lebrun, Lesueur and Mignard.

Vousoir, voo-swâr', an architectural term meaning one of the stones which form the arch of a bridge, vault, etc., and are always cut more or less in the shape of a truncated pyramid or wedge. The under sides of the vousoirs form the intrados or soffit of the arch, and the upper sides the extrados. The middle vousoir is called the keystone of the arch. See ARCHITECTURE.

Vow, a solemn promise made to perform some act, or to follow out some line of conduct, confirmed by an appeal to the Supreme Being, or supernatural power, to favor or to punish the maker of the promise according as he fulfils or breaks such promise. Some vows bind those who make them to perform a certain act out of gratitude for a particular favor, as in the case of Jephthah; others comprehend the performance of certain limited duties during a whole life-time, as the marriage-vow and a sovereign's coronation oath; and others, again, give a particular form to the entire character of a man's life, as the monastic and priestly vows. Among Roman Catholics vows are divided into two kinds: Solemn, those taken in the face of the Church; and simple, those made in private. Bishops are considered to have the power of releasing from simple vows generally; but the power of dispensing in important simple, and in all solemn vows rests with the pope; the vows specially reserved for papal dispensation were: that of absolute and perpetual chastity, entering into a religious order, making a pilgrimage to Rome or Compostella, or of setting out on a crusade. See RELIGIOUS ORDERS.

Vowel (from the French *voyelle*; Latin, *vocalis*), a simple articulated sound, which is produced merely by breathing, accompanied by a constriction in the larynx, a greater or less elevation or depression, expansion, and contraction of the tongue, and contraction or expansion of the lips. The vowel sounds of the English alphabet are imperfectly represented by five letters, *a, e, i, o, u* (and sometimes *w* and *y*); the deficiency of our alphabet may therefore be seen at a glance, when we mention that there are at least 13 distinct shades of vowel-quality in the spoken language as heard in the words *ale, an, ash, ah, all; ell, err; est, ill; old, ore; pull, ooze*. The long sound of *i*, as in *ire*, and of *y*, as in *by*, although represented by one letter, are really compound vowel sounds or diphthongs. The French simple vowel sounds *u* and *eu*, and the German *ö* and *ä*, are not heard in the English language. See the articles under the several letters.

Voyageur, vwo-yä-zhër', a French-Canadian term for traveler. It was specifically applied to a class of men employed by the fur companies in transporting goods by the rivers and

VOYNICH — VULCANIZATION

across the land to and from the remote stations of the Northwest. They were nearly all French Canadians or half-breeds.

Voynich, vo'i'nich, Ethel Lillian Boole, English novelist: b. 1864. She was a daughter of G. Boole (q.v.), and was married to W. M. Voynich, a Polish writer in England. She is the author of 'Russian Humor'; 'Stories from Garshin'; 'The Gadfly,' a very striking story which excited much attention (1897); 'Jack Raymond' (1901).

Voysey, voi'zi, Charles, English theistic clergyman: b. London 18 March 1828. He was graduated from Oxford in 1851, took Anglican orders and was curate of Hesse, Yorkshire, 1852-9, of Creighton, Saint Andrews, Jamaica, 1860-1, and of Saint Marks, Whitechapel, London, 1861, but lost the last position on account of a sermon of his against endless punishment. He was vicar of Healaugh, Yorkshire, 1864-71, but having published in 1865 sermons declared to be opposed to the Bible and the 39 articles, he was prosecuted in the Chancery court and the case being taken to the judicial committee of the Privy Council he was deprived of his living and forced to pay the costs in 1871. He subsequently founded the Theistic Church in Swallow Saint Piccadilly, London, the church being supported by the "Voysey establishment fund." Among his published works are: 'The Sling and the Stone' (1872-93); 'Theism as a Religion of Common Sense' (1894); 'Theism as a Science of Natural Theology and National Religion' (1895); 'Testimony of the Four Gospels concerning Jesus Christ' (1896).

Vredenburg, Edric Walcott, English novelist: b. Para, Brazil, 29 March 1860. He was educated at Tonbridge School, Kent, entered the army and was a lieutenant in an Essex regiment. He has since given his attention to writing novels as well as stories and verse for children. Among his works may be cited: 'The Haunted House in Berkeley Square'; 'A Bitter Inheritance'; 'At the World's Mercy'; 'By the Queen's Command.'

Vreeland, Herbert Harold, American railway president: b. Glen, Montgomery County, N. Y., 28 Oct. 1856. He received a common school education and worked his way upward from a humble position to that of railway president. In 1893 he became president and general manager of the New York Metropolitan Street Railway Company and was prominent in the consolidations which subsequently placed all surface railways on Manhattan Island under one management.

Vriendt, frént, Frans de. See **FRANS**, **FRANS**.

Vriesland, frés'lánt. See **FRIESLAND**.

Vryheid, fri'hid, South Africa, a town of Natal, prior to the South African war, 1899-1902, belonging to the Transvaal Republic. It is about 280 miles north of Durban by the railway through Pietermaritzburg, Ladysmith, and Dundee, in the centre of a district containing coal, gold, and other minerals. It has Dutch Reformed, Anglican, Wesleyan, and other churches, a masonic temple, schools, and mineral springs. The district of Vryheid was ceded to a party of Boers by Dinizulu, a Zulu chief, in 1884, and was constituted a separate state under the title of the

New Republic. In 1888 it was incorporated in the Transvaal. The white population of the district is about 5,800; of the town, 2,400.

Vuillaume, vwé-yôm, Jean Baptiste, French violin maker: b. Mirecourt 7 Oct. 1798; d. Paris 19 Feb. 1875. He settled in Paris in 1818, and imitated the instruments of Stradivarius, the Amatus and Maggini. He came to stand with Lupot at the head of French musical instrument makers of the 19th century. Long journeys were made by him after special kinds of woods, and he was constantly experimenting toward improvements. He received many distinctions. In the Paris Exposition in 1867 he was ranked above competition.

Vulcan, the Roman god of fire and patron of metallic handicrafts; the son of Jupiter and Juno, and identical with the Greek Hephaestus. According to mythology Vulcan was ugly and deformed, and Juno, ashamed to own such a child, dropped him from heaven, when the infant god, falling into the sea, was rescued and adopted by Thetis, who kept him till nine years of age. He was then restored to his parents. Soon after his return to Olympus, Vulcan took his mother's part in one of the quarrels between husband and wife; Jupiter, enraged at Vulcan's audacity, flung him from heaven. The youth alighted on the island of Lemnos, breaking his ankle in the fall; here he raised forges and workshops, and became the chief of artificers. Some poets, however, fix his workshop on Olympus, another on Etna, where Cyclops were his chief assistants. He fashioned Pandora, and had Venus given him for his wife, by whom he was father of Cupid. Vulcan is represented bearded, covered with dust and soot, and toiling hard at his forges.

Vulcan, in astronomy, the name given a planet between the Sun and Mercury. In 1899 M. Lescarbault, a village physician of Orgèze, France, saw a small dark planet-like body pass across the sun's disk. The planet was called by anticipation Vulcan, but its existence still remains unconfirmed, though M. Porro and M. Wolf of Zürich reported seeing its transit in 1876.

Vulcanist, the name applied to an old school of geologists at the end of the 18th and the beginning of the 19th centuries, who held that most rocks, but particularly the basalt, were due to volcanic or igneous agencies. They were opposed by the Neptunists led by Werner, who believed that this rock in common with most others was the product of crystallization from water.

Vulcanite, the harder of the two forms of vulcanized caoutchouc (see **VULCANIZATION**). It is differentiated from the softer product (soft rubber) in containing a larger quantity of sulphur and being cured at high temperatures. In color it is dark-brown, almost black, but it may be made jet-black by litharge or red by vermilion. It is not affected by the caoutchouc solvents, or by the mineral acids and alkalis. Owing to the large quantity of electricity evolved by it when rubbed, it is much used for the plates of electrical machines. The other applications of it are, of course, very numerous. Ebonite is a rarer name for it. See **INDIA-RUBBER**; **RUBBER MANUFACTURES**, **AMERICAN**.

Vulcanization, a method of so treating caoutchouc (q.v.) with some form of sulphur as

to effect certain definite changes in its properties and obtain a softer or harder product. The former is known as soft rubber, the latter as vulcanite (q.v.). The method of preparation of soft rubber goods is in general as follows: The gum is mixed with the suitable proportion of sulphur (usually 5 to 6 per cent), while other ingredients are added to make the caoutchouc, the most expensive constituent, go as far as possible. These other substances include litharge, whiting, and white-lead, a common formula being, rubber 16, sulphur 1, litharge 2, whiting 14, white-lead 2½. For some purposes, fabrics of cloth and rubber, and refuse vulcanized rubber, are also used in the mixture. After the mixture has been reduced to uniformity and rolled into sheets, it may readily be fashioned into any required shape. It may also be applied to one side or both sides of canvas or cloth, and, owing to the pronounced adhesiveness of the mixture, the coated goods may be fashioned into articles of practically a single piece. The harder product (vulcanite) is prepared in much the same way, the chief difference being in the proportion of sulphur, which is 6 to 8 parts, and in the high heats employed in curing. The process of vulcanization was invented by Charles Goodyear (q.v.), who obtained his first patent in connection with it in 1844. See *INDIA-RUBBER*; *RUBBER MANUFACTURES*, *AMERICAN*.

Vulgate. The, is the Latin translation of Bible, due mostly to Saint Jerome (q.v.), which has been adopted as the authorized Bible of the Roman Catholic Church. The name, *vulgata biblicorum editio*, which means common or current edition of the Scriptures, was first applied to the Septuagint and then to the Old Latin Version derived from it; but after Saint Jerome's new translation came into common use, it inherited the name. Some scholars still speak of the Old Latin Vulgate or the Greek Vulgate; but the name, used without qualification, properly applies only to the official Roman Catholic Bible.

Place in History.—Neglected for a long time, the Vulgate has during the last few decades won back from scholars a recognition of its intrinsic excellence, its importance for the study of the Bible text, and its place in history. In English-speaking countries, this is due mainly to the labors of Anglican divines, such as Westcott, Wordsworth, White, Scrivener, and Burkitt. Westcott, for instance, regards it as "not only the most venerable, but also the most precious monument of Latin Christianity." Its great antiquity and the exceptional qualities of its translator make it a most valuable aid toward the recovery of the original text. Its New Testament, in its revised form, is contemporary with the oldest Greek manuscripts and embodies a much earlier text. The Old Testament antedates by several centuries the oldest Hebrew manuscripts. Almost from the time of its publication, the Vulgate has had a very great influence upon the religion and civilization of Europe. It gradually became the Bible of Europe; it has been called the book of the Middle Ages. Latin then was the language of the educated and the Vulgate their Bible. From it was derived the theological language of Europe and much of its thought. Hebrew idioms came through it to enrich our daily speech. National

literatures took their rise in ventures to translate it: its text called forth the most beautiful work of the illuminators of manuscripts. Poetry, painting, and music owed to it much of their inspiration and grandeur. "It was the real parent," says Westcott, "directly or indirectly, of all the vernacular versions of western Europe," except the Gothic of Ulphilas. The translators of the Protestant versions had it constantly in hand, though it was "the guide" rather than the source of their work. Upon English Bibles, its influence is very marked, particularly upon the Authorized Version. The Psalter of the Prayer Book, still used in worship, is a translation of the Vulgate: such naturally, too, are all modern Roman Catholic versions, like the English Douai Bible.

Latin Bible Before Saint Jerome.—The Vulgate, we have implied, was preceded by an earlier Latin Bible, and its history cannot be properly understood without some account of its forerunner. Throughout the 4th century, this Old Latin Version, as it is called, was read in all the churches of northern Africa and western Europe, but the tradition of its origin seems to have perished. It is known that it was based, not on the original Hebrew, but upon the Greek of the Septuagint. This is its most notable difference from the Vulgate. It can be traced back with certainty to the middle of the 3d century and, with great probability, even a century earlier. Its place of origin is unknown; nor even can we determine whether there were several distinct translations, made in different times and countries, or originally but one. The Old Testament has survived in a few books and many fragments, but these do not shed much light on their origin; and the many manuscripts of the New Testament furnish to scholars no satisfactory solution. The old Latin Version is historically important by reason of its influence upon the Vulgate; moreover, despite its variations, it is a witness of the highest value to the current New Testament text of the 3d century. The books and fragments of the Old Testament also aid in determining the text, and sometimes the arrangement, of the Septuagint. Certain books of this ancient version, we shall see, were revised by Saint Jerome and incorporated in the Vulgate; a few were adopted without change and remain part of the Catholic Bible. It was the corrupt condition of the existing Latin text that caused Saint Jerome to undertake, first, a revision and then a translation of the Bible. We must remember that in his day, toward the end of the 4th century, the old version had been in circulation about 200 years. It is easy to see to what chances of corruption it was exposed. Experience proves that no manuscript can pass through many hands without the introduction of frequent changes and in the case of this old version, more than the ordinary causes of corruption seem to have been at play. Saint Augustine (q.v.), a younger contemporary of Saint Jerome, was so conscious of the almost innumerable variations in the current text that he advanced the theory—or possibly we should say, handed down the tradition—that there were almost innumerable distinct translations. Saint Jerome goes even further, stating that there were nearly as many types of text as there were manuscripts. This much is clear, that the confusion was almost hopeless and very perplex-

ing, whether we consider public worship or private devotion. There was an urgent need of a revised text, and Latin Christendom was most fortunate in possessing two men fitted to furnish it, Damasus the pope and Jerome the scholar. Damasus was the most distinguished pontiff of his century and left to posterity the fame of an enlightened and energetic reign. As to Jerome, Westcott does not exaggerate in saying that he was the one man in 15 centuries capable of the task he accomplished; without him, in all probability, Europe would have had to wait till the Renaissance for a translation comparable to the Vulgate. The history of his life is in great part the history of its production.

Saint Jerome (Eusebius Hieronymus, as he was called) was born of Christian parents at Stridon, on the borders of Dalmatia and Pannonia, now Szalad in Hungary, probably between 340 and 346 A.D. His father, Eusebius, a man of education and means, perceived the ability of the boy and sent him to Rome, at an early age, to complete his studies. There he awoke to the love of literature and, despite some aberrations, was strengthened in the love of religion—the two impulses which dominated his life and have left their impress on western Europe. Unconsciously, he was all along preparing himself for his great task, the translation of the Bible. He acquired a firm grasp of the Latin idiom, through his deep study of its literature, and laid the foundations of his subsequent thorough knowledge of Greek; at the same time, he was fostering that religious spirit which later caused him to devote himself to sacred rather than to secular studies. He was baptized in Rome about 366. Not long after, he removed to Trier, in Gaul, and later (370) to Aquileia in North Italy, where in the company of other young men of talent and piety, he vigorously pursued the study of theology. The company breaking up in 373, Jerome traveled in the East, visiting Greece, Asia Minor, and Syria. At Antioch, in Syria, a dream decided the work of his life: Christ, in an apparition, reproached him with being a Ciceronian and no Christian. Henceforth he gave himself to sacred studies and religious practices; in his old age, however, he was able to reconcile with them the reading and teaching of pagan literature. In the summer of 374, he retired to the desert of Chalcis, east of Antioch, where he spent five years in study and prayer. During this period, under the instruction of a Jewish rabbi, he made a diligent study of Hebrew; at this time, too, began his correspondence with Pope Damasus, which led later to such happy results. Jerome was ordained priest at Antioch, in 379, though he appears never to have exercised the functions of his office. In 380, we find him in Constantinople, the capital of the empire, where he fell under the spell of the winning and cultivated Saint Gregory Nazianzen. At length, in 381 or 382, he returned to Rome. He was soon admitted into the closest intimacy with Damasus, which lasted till the pope's death, in December 384. It was during this period (in 383) that Jerome, at the request of the pope, revised the Old Latin Version of the gospels and shortly after, of the remaining books of the New Testament. His Roman Psalter was also published about this time. Jerome had great popularity and influence at Rome under Damasus, and, nat-

urally, had made some enemies: their opposition increased after his patron's death and caused him to leave Rome forever, in August 385. He returned again to the East, his eager, inquisitive mind and his spirit of piety both impelling him to visit all the holy places of Palestine and to study its topography, cities, and traditions. Finally, in the autumn of 386, he settled at Bethlehem, near the cave of the Nativity, and built a monastery, over which he henceforth presided. In this retreat, during the last 34 years of his life, he "scorned delights and lived laborious days" of study, writing and meditation: their fruit was given to the world in his famous epistles, his commentaries and controversial writings, but above all in his translations of the Sacred Books. In his work on the Hebrew text, he was almost constantly assisted by learned rabbis. He died in 420.

Revisions of Old Latin Version.—New Testament.—Jerome's work as a reviser and translator began with the gospels (383). These books were the most important and familiar, and also, because of their wide circulation, the most corrupt in text. The task which Damasus committed to him, was not a new translation, but merely a revision of the familiar text. For this, Jerome collected and consulted the best Greek manuscripts he could find, and with their guidance, corrected the Latin wherever the sense required it. Shortly after the rest of the New Testament was corrected in the same way, though more slightly, it appears. All this work became part of the Vulgate: Jerome never made a fresh translation of the New as he did of the Old Testament.

Old Testament.—The Psalter, the prayer book of the Church in daily worship, was the first book retouched by Saint Jerome. In the course of his life, he published three editions of the Psalter; it will be convenient here, for clearness' sake, to speak of all three. The first or Roman Psalter, published at Rome in 383, was adopted there for public services and continued in use till the time of Pius V. (1566). For this revision, Jerome had recourse only to the Greek text. It never became part of the Vulgate and has gone out of use, except that the invitatory psalm (94) in the Breviary (qv) and the quotations from the Psalter in the Missal are taken from it. This revision itself becoming corrupt, through the errors of copyists, a second revision was called for. This, published at Bethlehem in 387, is the Gallican Psalter, so called, because it was adopted for public worship in the churches of Gaul. It was based likewise upon the Greek text, but is a more critical recension than its predecessor. It is now used throughout the Latin Church and has been incorporated in the Vulgate: yet it is not Jerome's best edition of the Psalter. This is conceded to be his third or Hebrew Psalter, a new translation made directly from the Hebrew (probably 392).

Other books of the Old Testament were revised by Jerome according to the Septuagint (qv): he himself mentions Job, Proverbs, Canticle of Canticles, and Chronicles by name, but it is believed, from his words, that he revised all the books of the Septuagint which are contained in the Hebrew Canon. All, however, have perished except Psalms, mentioned above, and Job.

Translations from the Hebrew.—Jerome's work as a reviser made him thoroughly acquainted with the great variations of the Septuagint text and threw him back, more and more, upon the Hebrew as the one standard. There, thanks to the watchfulness of the rabbis, he found instead of the confusing variety of the Septuagint an almost perfect agreement in the manuscripts. The controversy with the Jews, who taunted Christians with using a corrupt text, had great weight in determining Jerome to translate the Hebrew Bible. His friends, too, were repeatedly urging the task upon him, so he finally set about it, not following any set plan (he began with Samuel and ended with Esther), but translating such books as his friends requested. This translation, therefore, it appears, contrary to the impression of many, was not undertaken as an official work, destined for public services. He intended it primarily for the eyes of his friends and desired them, out of a fear of controversy, to keep it private. For about 15 years, from 390 to 405, he labored at this great task and succeeded in translating all the books of the Hebrew Canon (same as the Protestant Canon). Of the remaining books of the Old Testament, which are accepted as inspired by the Roman Catholic Church, he translated Tobias and Judith from the Aramaic, and from the Greek the passages of Daniel and Esther, which are not found in the Hebrew (Dan. iii. 24-90, xiii.-xiv.; Esther x. 4-xvi. 24). There is ground for believing that he translated or revised the books of Maccabees. Wisdom and Ecclesiasticus he left untouched, and passed over Baruch.

Reception of the New Translation.—Jerome's friends could not keep their good things to themselves; his translations, eagerly sought and copied, and soon widely circulated, raised a storm of opposition. The gospels, indeed, though sanctioned by the authority of Pope Damasus, had been bitterly attacked by many, but when his Old Testament was published and the extent of its variations from the Old Latin rendering of the Septuagint became known, Jerome found enemies in every quarter. The Septuagint was popularly regarded as an inspired translation, according to the well-known legend; to vary from it was to corrupt the word of God. So Jerome was sacrilegious and presumptuous in daring to correct the venerable text; he was disturbing the faith of the people. Even the great Augustine at first did not approve of his translation. Jerome defended himself with more than his usual warmth, especially, against the charge of disrespect toward the Septuagint: for had not he spent years of his life rendering it faithfully into Latin? Gradually the storm subsided; part of his work won favor and public recognition; the bitter attacks were passed—he died in peace and was recognized as a Saint and Doctor of the Church.

Vulgate During the Middle Ages.—It was long centuries, however, before the translation of Jerome became the Vulgate or official version. Old memories and affections were entwined around the ancient text and the new was looked upon as an intruder; just as in our own day, the Revised Version has thus far made no advance in public favor. At Rome, Jerome had great prestige because of his many friends there, his reputation as a scholar, and the patronage

extended to him by Damasus. Many of the clergy admired and used his version, and the example of Rome was followed in different parts of Europe. The remote provinces, like Britain and Africa, clung to the old. In the 6th century we see the new translation current almost everywhere except in Africa; yet Pope Gregory the Great, who saw the beginning of the next century and died (604) just 200 years after Jerome had completed his translation, did not enforce its usage. His marked preference for it, however, turned the tide in its favor and it spread rapidly all over Europe. In the 9th century it was used throughout the church; yet it is a curious fact that the Old Latin survived till the 13th century wherever the heresy of the Albigenses prevailed, and even, in Bohemia, till the 15th century (Berger, p. 74).

Corruption.—The old Bible did not die without leaving traces of itself upon its successful rival. It must be remembered that in the early Middle Ages the Bible circulated, not in one volume, but in separate books: it easily happened, then, that a new manuscript was copied, according to the books at hand, partly from the old, partly from the new translation. Many readings of the Old Version, too, found their way into the new, particularly in the gospels and epistles, where the familiar text, dwelling in the memory of the scribe, displaced Jerome's corrected text. In the synoptic gospels, containing so many parallel passages, the text of one gospel was often substituted for the text of another. Occasionally, though not frequently, a phrase was altered to give clearer expression to a dogma. Other sources of error existed, but the chief of all was the perennial one—the carelessness of scribes.

Efforts to counteract this downward tendency were unceasingly made during the Middle Ages. Cassiodorus, Alcuin, Lanfranc, Stephen Harding, and many others are mentioned as strenuous laborers in this field. Roger Bacon, we are told, spent nearly 40 years correcting and explaining the sacred text. Schools even were established for the purpose of recovering, diffusing, and handing down to posterity the pure text of God's word. Often the supposed corrections were themselves mistakes; yet they were perpetuated in many manuscripts, with the chance of being accompanied by new errors in every new copy. Their importance, however, must not be exaggerated. The many manuscripts of the Vulgate which we inherited from the Middle Ages show, so far as they have been examined, that these mistakes are seldom serious from a dogmatic or devotional point of view. Only the printing press seemed capable of preventing their multiplication, for the scholars of that time, as White says, had used all the remedies that could be applied before the invention of printing.

Printed Vulgate.—The press, at first, did little toward the restoration of a pure text. The best texts, it is believed, were preserved in the most handsome manuscripts and these were too costly to be sent to the printing shop. Inferior texts were consequently the first printed and little criticism was applied to correct them. The famous Complutensian Bible made an attempt at a critical edition of the Vulgate, but its success was slight. Stephanus, a French Protestant, was somewhat more successful. The printing press was multiplying Bibles rapidly and

VULGATE

mistakes as well, it may be said. According to White, during the first half century following the invention of printing, in 1436, it is computed that 124 editions of the Vulgate were printed; another count, from 1471 to 1599, enumerates 179 editions.

These editions were not mere reproductions, one of another, many different manuscripts had been consulted and many editors were at work, each using his judgment (or his whim) in the correction and choice of texts. To add to the variety, several new Latin translations, by both Catholics and Protestants, were put forth.

Decree of the Council of Trent.—It is easy to see how bewildering must have been this immense variety of old and new translations. A standard text had become imperative. It was necessary, too, since the question of the Canon of Holy Scripture was debated, to determine which books should be included in the Catholic Bible. Accordingly, in 1546, the Council of Trent closed the Canon, accepting as sacred and canonical all those books which the tradition of the Church, and especially the Council of Florence, had declared to be inspired; moreover, the decree specified that they were accepted "as they were had in the Latin Vulgate." In the same year the Council ordered that the Vulgate be printed in as correct a text as possible and requested the Pope to carry out the measure. These two important points—the books included in the Vulgate and the text authorized by the Roman Catholic Church—call for separate and somewhat detailed treatment.

Books Included in Vulgate.—First, we give a list of the Vulgate books, in their proper order, according to the names which they bear in the Douai translation. These names, it will be seen, often differ from those of the Authorized Version; they are derived from the Septuagint through the Latin, while the Protestant names come in part from the same source and in part directly from the Hebrew. We subjoin the latter wherever the difference is notable. The books of the Old Testament are: Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Josue (Joshua), Judges, Ruth, I. and II. Kings (I. and II. Samuel), III. and IV. Kings (I. and II. Kings), I. and II. Paralipomenon (Chronicles), I. Esdras (Ezra), II. Esdras, or Nehemias, Tobias, Judith, Esther, Job, Psalms, Proverbs, Ecclesiastes, Canticle of Canticles (Song of Songs), Wisdom, Ecclesiasticus (Sirach), Isaias, Jeremias, Lamentations, Baruch, Ezechiel, Daniel, Osee (Hosea), Joel, Amos, Abdias (Obadiah), Jonas, Micheas (Micah), Nahum, Habacuc, Sophonias (Zephaniah), Aggeus (Haggai), Zacharias, Malachias, I. and II. Maccabees. In the New Testament, the books and their names are identical with those of the Authorized Version, except that the last book is called in the one Apocalypse and in the other Revelation. The Vulgate, as finally adopted by the Roman Catholic Church, is a mosaic: it is made up of direct translations from Hebrew, Aramaic, and Greek, of revisions of Old Latin, according to the Septuagint and the Greek New Testament, and, lastly, of Old Latin translations unrevised (See JEROME'S TRANSLATION FROM THE HEBREW.)

Differences Between Roman Catholic and Protestant Bibles.—The foregoing list will have made clear the most striking difference between

the Vulgate and the ordinary Protestant Bible of to-day—the inclusion of Tobias, Judith, Wisdom, Ecclesiasticus, Baruch, and I. and II. Maccabees among the sacred books of the Bible on an equal footing with the rest. These books were formerly printed in Protestant Bibles, sometimes as integral parts of Scripture, sometimes with an undefined standing, more frequently as being unequal to the other books, but useful "for example of life and instruction of manners." With them may be classed the additions to Esther and Daniel, mentioned in the fifth topic. All these portions of the Vulgate are now generally excluded from English Protestant Bibles, but find a place in the Lutheran. They are still used in the public services of the Anglican Church. Subtract these books from the Vulgate list and the order of the books in the two Bibles will be found identical. Many minute differences, which cannot be noticed here, are found in the inner arrangement, but more particularly in the numbering of the contents of several books. Textual divergences, naturally, are the most numerous, but their extent and importance have been greatly exaggerated. The Canon remains the only really great difference.

Official Text of Vulgate.—The order of the Council of Trent, promulgated in 1546, that an official text of the Vulgate be printed, remained unfulfilled till the reign of Sixtus V. (1585-1590). The attempts of previous pontiffs had led to little result. Sixtus summoned a commission of cardinals and scholars and entrusted them with the work; not content with this, he applied himself vigorously to the task, with more energy than critical acumen and with no scrupulous deference to the opinions of the commission. The edition, called after him the Sixtine, was completed and published in 1590, a few months before the death of the Pope. It was soon found to contain numerous errors, and all copies of it were recalled two years later by Clement VIII., who published a new and more correct text (1592). The Clementine Vulgate has ever since remained the official Bible of the Roman Catholic Church.

Sixtus V. had prefixed a Bull to his edition, declaring that it must be held as "the true, lawful, authentic, and undoubted" version of the Scriptures; he forbade anyone, under penalty of excommunication, to print a different edition of the Vulgate. This prohibition was also contained in the Clementine Bull. The effect of it was to put an end to the intolerable confusion of texts; indirectly, too, it is generally believed to have impeded the recovery of the true text of Saint Jerome. Some writers, Catholic and Protestant, have tried to extract from these Bulls a dogma of textual accuracy, this position is stultified by the action of Pope Clement, who recalled the "authentic" version of Sixtus and published another "authentic" version, differing from the former, it is said, in 3,000 places. The popes consider matters of discipline, but not of dogma, as subject to rectification. The action of Clement merely constitutes his edition the official Bible of the Church and guarantees its general trustworthiness and its freedom from doctrinal or moral error. The Clementine Vulgate, claimed to be better than any predecessor, but not to be perfect; it will probably give way itself to a more perfect version when modern scholarship shall have arrived at assured results.

Value of Vulgate Text.—Modern scholarship, however, is far from having settled the exact text either of the Old or of the New Testament, and Jerome's version remains one of the best witnesses to the originals, though its value is not uniform throughout. His revision of the gospels, to quote Bishop Westcott, "represents the received Greek text of the 4th century, and so far claims a respect, speaking roughly, equal to that of a first-class Greek manuscript." Jerome, it should be remembered, sought out the best manuscripts of his day; the type of text he followed corresponds partly to that in greatest favor at present, partly to another now no longer known. His revision of the rest of the New Testament was not so thorough and probably let many inaccuracies remain; he himself in his commentary on the Galatians departs at times from the received Latin text.

In the Old Testament Jerome followed a text almost identical with the Massoretic, and, therefore, of the greatest value. His translation shows him to have been "a good, but by no means immaculate, Hebrew scholar." In general, his work was done with the greatest care and light was constantly sought from learned Jews. Tobias and Judith, however, in whose canonicity he did not believe, were translated hurriedly. Almost all scholars would agree with the judgment of White, who says, in summing up this matter: "We may confidently assert that the general standard of the translation is a very high one."

Literary Qualities.—The language of the Vulgate was based upon the common conversational Latin of its day, used by all classes of the people; it differed greatly from the literary Latin and contained many words and forms considered archaic or rude. Despite the flavor which this origin frequently gives to the language of the Vulgate, the translation is greatly admired for its simplicity, clearness, flexibility, force and majesty. In the poetical and prophetic books it is unsurpassed. These fine literary qualities may be attributed to the genius of Jerome; yet they are present also in books which he did not touch. The Latin language, indeed, seems peculiarly adapted to render Hebrew thought and feeling; thus the Vulgate has ever been a favorite with literary men who love both the Bible and the language of Cicero, especially in continental Europe.

English Translations of the Vulgate.—The first English translation of the entire Vulgate is commonly attributed to Wyclif (c. 1384). The second is the work of Roman Catholic scholars in exile, who published the New Testament at Rheims, in 1582, and the Old at Douai, in 1609. The Rheims-Douai Version has remained ever since the Bible of English-speaking Catholics; passing through numerous editions, it has lost much of its original roughness and Latin phraseology and approached more closely to the King James Version. Scholars acknowledge its "anxious fidelity," whether in praise or blame, as well as its very great influence upon the interpretations and vocabulary adopted by the Authorized Version.

Bibliography.—White's lengthy article, 'Vulgate,' in Hasting's 'Dictionary of the Bible' (to which we are particularly indebted); also in same Dictionary, article, 'Latin Versions,' by Burkitt; Westcott, on Vulgate, in Smith's D. B.;

Kenyon, 'Handbook to Textual Criticism of New Testament'; 'Our Bible and the Ancient Manuscripts,' by the same; Gigot, 'General Introduction to the Scriptures'; Berger, 'Histoire de la Vulgate pendant les premiers siècles du moyen âge.' In Vigoroux, 'Dict. de la Bible,' articles 'Jerome,' 'Latines Versions'; Kaulen, 'Geschichte der Vulg.' For fuller biography, see White; also for list of Vulgate manuscripts.

JOHN F. FENLON, S. S., D.D.,
Professor of Sacred Scripture and Hebrew,
St. Joseph's Seminary, Yonkers, N. Y.

Vulpius, vool'pé-oos, Christian August, German writer: b. Weimar, Germany, 23 Jan. 1762; d. there: 25 June 1827. He was educated at Jena and at Erlangen, and under the direction of his brother-in-law, Goethe, he was later secretary of the court theatre at Weimar. He was appointed first librarian and overseer of the cabinet of coins in the library at Weimar in 1797, a position he occupied until his death. He wrote numerous plays, romances, etc., which were popular in their day, but are now scarcely remembered with the exception of 'Rinaldo Rinaldini, der Räuberhauptmann' (1797), which has been translated into various languages, and widely imitated. He also edited: 'Kuriositäten der physisch-litterarisch-artistisch-historischen Vor- und Mitwelt' (10 vols., 1810-23); and 'Die Vorzeit' (4 vols., 1817-21).

Vulture, any of various birds of prey which habitually feed on carrion. The vultures of the Old and New Worlds are quite distinct, the former constituting a family (*Cathartidae*) already sufficiently described under the articles CARRION-CROW, CONDOR and TURKEY-BUZZARD; while the latter are much more nearly related to the hawks and eagles (*Falconidae*), of which they are considered to be a subfamily (*Vulturinae*) or to form an allied family (*Vulturidae*). This group is distinguished by the possession of a strongly-hooked compressed bill; by short tarsi covered with reticulated or small polygonal scales. The middle toe is longer than the tarsus, and the hinder toe is a little elevated. The claws are blunt, but more or less hooked. The head and neck are frequently naked or covered with a light down. A large crop exists and the intestinal caeca and syrinx, wanting in the *Cathartidae*, are present. There are numerous other differences in skeletal and other parts. The cinereous vulture (*Vultur monachus*), is distinguished by the presence of a ruff of feathers, and by the crest borne on the back of the head. It inhabits Europe, Asia, and Africa, and is common. It may attain a length of three or four feet, and its color is a chocolate-brown with the naked head and neck blue. A long tuft of feathers springs from the base of the wings. The bird inhabits wooded situations as a rule, and appears to content itself with carrion, but rarely ventures to attack living animals. The nest is generally built in a tree.

The genus *Otologyps*, including the *O. calvus*, or Pondicherry vulture, and the *O. auricularis* or sociable vulture, is distinguished from the preceding genus by having a bare head and neck, with long wattles dependent from just below the head. The sociable vulture inhabits South Africa. It is colored a general blackish-brown, and its average length is four feet. The naked head and neck are light-red. The Pondi-

cherry vulture inhabits India, and is about three feet in length. Its head and neck are flesh-colored, and the chest bears a tuft of white feathers, the plumage generally being dark or blackish-brown. The genus *Gyps* is represented by the griffin or fulvous vulture (*G. fulvus*), and is distinguished by the bill being swollen or distended at the sides, the head and neck being covered with short down, and the neck possessing a ruff of long pointed or downy feathers. The griffin vulture inhabits Europe, Asia, and Africa. It attains a length of four feet, and is of a general yellowish-brown tint, the tail and wing quills being black, and the neck ruff white. The head is covered with white down. It is abundant about the Mediterranean countries, and builds its nest on cliffs. It is noted for its activity and great powers of flight. The Egyptian vulture (*Neophron percnopterus*) inhabits South Europe, Egypt, and Asia. It is white, the quill-feathers of the wings being dark brown or black, and the face, bill, and legs chiefly yellow. It is of small size and trim build. This bird is also known under the designations of "Pharaoh's chicken," and "white crow," and is protected by laws from being injured. Besides carrion it devours all kinds of refuse left by the larger vultures and small reptiles, insects, etc. In the weak bill and some other respects the Egyptian vulture somewhat approaches the *Cathartida*. The celebrated lammergeier or bearded vulture (*Gypatus barbatus*), a genus and species distinguished from the preceding by the head and neck being feathered, and by the cere being concealed by bristly hairs, resembles the eagles in appearance and habits and is now generally considered as the representative of a subfamily (*Gypatinae*) of the *Falconidae*. (See *LAMMERGEIER*.) Consult: Dresser, 'Birds of Europe' (London 1881); and Blanford, 'Birds of British India' (London 1895).

Vyasa, *vyā'sā* ("the redactor or arranger"), the author, according to tradition, of the Vedas, the Mahabharata, the Puranas—of all ancient Sanskrit literature. It is evident that in this name is embodied the fact that these works have from time to time undergone recension. The name Homer has exactly the same meaning as Vyasa.

Vyatka, or **Viatica**, *vē-āt'kā*, Russia, (1) a town, capital of the government of same name, advantageously situated near its centre in a beautiful district at the confluence of the Klinovka with the Vyatka, 458 miles by rail west of Perm. Its houses are surrounded by gardens, and there are also public gardens. It has two cathedrals and also monasteries. There is steamer communication with Kazan. Pop. about 27,000. (2) The government has an area of 59,329 square miles. The chief river is the Vyatka, which joins the Kama, a tributary of the Volga. There are low hills, especially in the north, and forests of fir, oak, elm, and birch are extensive. Flax and hemp are important crops, and among the chief minerals are iron and copper, which are extracted and smelted. There are manufactures of woollens, linens, potash, leather, firearms, anchors, gun-carriages, etc.

Vyrn'wy, a river of Wales, rising in the northwest of Montgomeryshire, and after a circuitous course of some 35 miles falling into the Severn on the Shropshire border. Lake Vyrnwy, not far from its source, the chief reservoir of the Liverpool waterworks, completed in 1892, was formed by constructing a huge dam or embankment across the river valley, a former Glacial lake basin, the result being an artificial sheet of water about five miles long with an area of 1,121 acres and an available capacity exceeding 12,000 million gallons. The length of the embankment is 1,260 feet, its height 60, the length of the aqueduct to Liverpool 68 miles.

W

W the twenty-third letter of the English alphabet. It serves both as consonant and vowel; as consonant when it begins a word or syllable, and as vowel at the end of a word or syllable, where it forms a diphthong with a vowel preceding it, as in *how*, *grew*. Its sound is that of a voiced labial formed by rounding the lips as for pronouncing *oo*, then contracting the aperture so that the voice issues with some friction. W is silent in many words and positions; examples: *gunwale*, *sword*, *two*; *wrap*, *wrong*, *wright*. Words beginning with *wh*, are pronounced as though the aspirate preceded, as indeed it did in written Anglo-Saxon: thus *why*, *what* are sounded *hwai*, *hwat*; but there is a tendency both in Britain and the United States to drop the aspirate in such words or to minimize it, so that *when*, *what*, *white* become *w'en*, *w'at*, *w'ite*: nor is this mispronunciation restricted to the vulgar; it may be heard in the speech of the cultivated class; but it is a vice of speech parallel to that of the lower-class Cockneys when they confound *v* with *w*, saying *vile* for *while* and *wile* for *vile*, *warden* for *warden*, and so on. W is silent in the words *who*, *whom*. W in *whole* and in *whoop* is intrusive, not existing in Anglo-Saxon *hal*, *hol*, nor in French *houper*. In German *w* is a consonant only and represents very nearly the sound of the English *v*, but is a little weaker: hence the English forename Edward is in German written Eduard. The consonant sound of *w* in the Gothic languages is generally replaced in the Latinish languages by *gu*; for example, *Walter*, *Gualtier*, *William*, *Gaillaume*, *war*, *guerre*. The form (the letter *v* doubled) and the name of this consonant (double *u*) were both a true form and a right name when *w* first came into use. At that time—13th century—and long after the one character *v* (V) stood for the vowel sound *u* (*oo*), and its name was *oo*; at the same time it was used as the sign of the consonant now represented only by *v*: thus, while in form *w* is what it is called in French, *double vey*, or double *ve*, in sound it is for us what its name in English denotes, that of double *u*: See U:V.

Waagen, vā'gēn, Gustav Friedrich, German art-historian: b. Hamburg, Germany, 11 Feb. 1794; d. Copenhagen, Denmark, 15 July 1868. He was educated at Breslau, Dresden, Heidelberg, and Munich, in 1830 was appointed director of the picture gallery at the Museum of Berlin, and he accepted the chair of history of art at the University of Berlin in 1844. His publications include: 'Kunstwerke und Künstler in England und Paris' (3 vols., 1837-9); 'Kunstwerke und Künstler in Deutschland'

(1843-5); 'Die Gemäldesammlung der kaiserlichen Eremitage in St. Petersburg' (1864); 'Die vornehmsten Kunstdenkmäler' (1866-7); etc.

Waahoo', or **Wahoo**, a small tree (*Ulmus alata*) of the southern United States, having small ovate, often falcate, leaves and spreading branches, which form an open, rounded head. The branches have wide, wing-like corky ridges, which have suggested the name winged elm. The tiny samaras are edged with a silky fringe. The tree, while growing naturally in damp places, is a valuable roadside shade-tree, where it is hardy. It has a chocolate-colored fine-grained, heart-wood, which has been used in the South for wheel-hubs.

The spindle-tree (q.v.) (*Euonymus americanus*) is also called waahoo.

Waal, wāl, Netherlands, the Dutch name for the lower course of the Rhine, which enters the country a few miles above Nimwegen, flows through the province of Gelderland, to its confluence at Gorinchem with the Meuse, and thence continues westward through a many-channeled delta to the North Sea.

Wabash, wā'bāsh, Ind., city, county-seat of Wabash County; on the Wabash River, and on the Cleveland, C. C. & St. L., and the Wabash R.R.'s; about 90 miles northeast of Indianapolis and 130 miles southeast of Chicago. It is in an agricultural and stock-raising region, but it has considerable manufacturing interests. In 1900 (government census) the city had 109 manufacturing establishments, with capital invested, \$2,430,502. The number of wage-earners was 1,241; and the average annual amount paid in wages was \$589,355. The cost of material used was \$1,206,726, and value of annual products was \$2,225,990. The chief manufactures are flour, paper, spokes, carriages, woollen goods, machine shop products, lumber products, shoes, and hats. There are railroad repair shops, lumber and coal yards. The principal public buildings are the Soldiers' Memorial Hall, Masonic Temple, Woman's Orphan Home, and the county court-house. There are three parks. The educational institutions are a high school, graded schools, Wabash City Library, and a high school library. There are four banks, three national and one private, having (1903) a combined capital of \$331,000, and deposits amounting to \$1,457,000. The first settlement was made in 1837 and the same year the town was incorporated. In 1866 it was chartered as a city. The government is administered under the charter of 1866, which provides for a mayor, who holds office two years, and a council. Pop. (1910) 8,687.

Wabash, a river which has its rise in the western part of Ohio, flows northwest until it

WABASH COLLEGE—WACO

enters Indiana, where it takes an almost westerly course to Logansport, then flows southwest to Covington in Fountain County, then nearly south to the Ohio River. For about 120 miles of its lower course it forms the boundary between Indiana and Illinois. The total length is about 555 miles. It is the largest tributary of the Ohio, entering it from the north. The Wabash is navigable to Covington, about 300 miles, and when the water is high, to Lafayette. From Terre Haute to Huntington, the river is paralleled by the Wabash and Erie Canal which connects the river with Lake Erie.

Wabash College, located at Crawfordsville, Ind. It was established by four Presbyterian missionaries in 1832, was first opened to students in 1833, and obtained a charter from the legislature in 1834; the present site of the college was purchased in 1835. Though affiliated with the Presbyterian Church, the college is non-sectarian in control; the board of trustees number 21, of whom four are representatives of the alumni. Wabash is distinctively a small college aiming to give thorough college training, but not to do technical or university work. It is not co-educational, in which respect it stands almost alone among the colleges of the West and Middle West. Formerly the college conferred three degrees, A.B., B.Ph., and B.S., requiring a thorough course in Greek for the A.B. degree. All college courses now lead to the single degree of A.B. The course includes 104 hours of prescribed work, and 84 hours elective. Special courses are arranged by which technical and professional courses may be shortened in certain approved schools. There is a fellowship in English, a students' loan fund, and many prizes. A summer school under private control is conducted on the college grounds, work in which may count toward a degree. There is also a preparatory course. The college grounds contain 40 acres located in the heart of the city. On this campus are South Hall (occupied by the biological department and the museum), Center Hall, the gymnasium, Peck Scientific Hall, and Yandes Library Hall. The library in 1910 contained 45,000 volumes; the students numbered 384.

Wabasha, Minn., city, county-seat of Wabasha County; on the Mississippi River, and on the Chicago, Milwaukee & Saint Paul Railroad; about 30 miles northwest of Winona and about 100 miles southeast of Saint Paul. Lake Pepin, an expansion of the Mississippi, is about two miles above the city. Wabasha is in a fertile agricultural region, and has several manufacturing, chief of which are flour and oatmeal mills, foundry, machine shop, lumber mill, soap factory and a church furniture factory. The national bank has (1905) a capital of \$50,000 and deposits of \$250,000. Pop. (1890) 2,487; (1900) 2,528; (1910) 2,622.

Waccamaw, a tribe of North American Indians who, in the 18th century, lived on Waccamaw River of eastern South Carolina. They are last mentioned in 1755, after which date, it is supposed, they became incorporated with the Catawbas. From their association, the Waccamaws are believed to have belonged to the Siouan stock.

Waccamaw, a river which has its rise in the southeastern part of North Carolina, and is the outlet of Waccamaw Lake. It flows

south into South Carolina and joins the Great Pedee on the southern boundary of Horry County. Below the confluence of the rivers, the stream is often called Waccamaw. It enters the ocean through Winyah Bay. From the source of the Waccamaw to the Great Pedee is about 130 miles.

Wace, wās, an Anglo-Norman poet: b. Island of Jersey 1115; d. 1184. His Christian name is generally believed to have been Richard or Robert. He was patronized by Henry II of England, who made him a canon of Bayeux, Normandy. Two important works by him remain, the 'Brut d'Angleterre' and the 'Roman de Rou,' a history of Rollo and the dukes of Normandy, including the conquest of England.

Wace, wās, Henry, English Anglican clergyman: b. London 10 Dec. 1836. He was educated at Marlborough, Rugby, King's College, London, and Brasenose College, Oxford. He served curacies at Saint Luke's, Berwick Street, London 1861-3, and St. James', Piccadilly, 1863-9, and Grosvenor Chapel 1870-2, was chaplain of Lincoln's Inn 1872-80 and preacher there 1880-96. He was professor of ecclesiastical history in King's College 1875-83, in 1881 became a prebendary of St. Paul's, and in 1883 chaplain to the Archbishop of Canterbury and principal of King's College. He was Boyle lecturer ('Christianity and Morality') (1874-5) and Bampton lecturer ('The Foundations of Faith') (1879), but is best known as joint editor with Sir W. Smith of the great 'Dictionary of Christian Biography' (1877-87), and as himself the editor of the 'Speaker's Commentary on the Apocrypha' (1886).

Wachusett, wā-chū'sēt, Mount, an isolated peak in Worcester County, Mass., seven miles southwest of Fitchburg. The altitude is 2,018 feet, and the view from the summit, embracing a picturesque valley and several small bodies of water, is most beautiful.

Waco, wā'kō, a subtribe of the Wichitas (q.v.).

Waco, Texas, city, county-seat of McLennan County; on the Brazos River at the mouth of the Bosque, and on the San Antonio & A. P., the Missouri, K. & T., the Waco & N. E., the Saint Louis S. W., the International & G. N. the Houston & T. C., and the Texas C. R.R.'s; about 94 miles north by east of Austin and 85 miles south by west of Dallas. Waco is in a fertile agricultural region in which grain and cotton are the chief products.

Industries.—In 1909 (government census) the city had 92 manufacturing establishments representing about 75 industries. The capital invested in manufacturing plants was \$3,561,000; the number of wage-earners 1,239, and the average annual amount paid to wage-earners, \$808,000. The amount paid annually for raw material was \$2,965,000, and the value of the annual products was \$4,746,000. The chief manufactures were cotton products, printing plant products, men's clothing, wagons and carriages, watches, and foundry and machine shop products. The products of the saddlery and harness works were, for 1900, \$427,431, and ranked first in value among the industries of the city. Mineral and soda waters brought a combined revenue of \$77,433. Waco ranked seven among the cities of Texas in the value of manufactured products. The city is the principal inte-

rior cotton market of the State. In 1900-1901 it received and shipped over 210,000 bales. It is the great distributing centre between Austin and Dallas.

Municipal Improvements.—The city is well laid out, the streets are broad; over 60 miles are paved with asphalt, macadam, and gravel. The sewer system is excellent, over 100 miles of mains have been laid out. The waterworks are owned by the municipality, the purchase was made in 1903, and an issue of \$500,000 of bonds was effected, and the same were sold to pay for the water plant and works. There are a number of artesian wells, which have a medicinal value sufficient to attract many health seekers. A tubular-well system furnishes daily nearly 6,000,000 gallons of water. The city is surrounded by considerable prairie land which is used for park purposes, and there are three cemeteries. Waco is noted for its healthfulness, cool in summer, mild in winter; and with pure water and good sewerage, there are no opportunities for disease germs to flourish. Several bridges span the Brazos River, one a suspension bridge with 475 feet span. A cantilever bridge, for wagon traffic, built in 1901 by the city and county, cost nearly \$110,000.

Public Buildings.—The principal public buildings are the government building, county court-house, the churches, schools, banks, and some of the business blocks. The court-house, finished in 1903, is built of Texas limestone, and cost nearly \$300,000. The Masonic Order of Texas built here in 1904 and 1905 a Masonic Temple which cost about \$250,000. The city has hospitals, sanatoriums, and an Orphans' Home.

Churches and Schools.—There are 47 churches, representing nearly all denominations. The educational institutions are four colleges: Baylor University (Bapt.), opened in 1845; Texas Christian University (Christian), opened in 1873; Saint Basil's College (R. C.), opened in 1900; Paul Quinn College (African Methodist Episcopal), opened in 1881. There are four institutions doing high school work: two public high schools, the central, for white pupils, and the high school for colored pupils. The Douglas-Schuler School (M. E. So.), and the Academy of the Sacred Heart are private schools doing high school and more advanced work. There are 13 ward public school buildings and one Roman Catholic parish school. Waco has two business colleges, which have a high standing, one city library (building cost about \$30,000), and several school libraries.

Banks and Finances.—Waco has four national banks, two savings banks, and one state bank, capitalized for nearly \$1,500,000. The municipal receipts and expenditures are over \$400,000. The chief items of expense are the schools and the interest on the bonded and floating debt.

Waco was surveyed as a town in 1849 and incorporated in 1850. Its growth in population has been steady and has more than kept pace with the growth in commerce. The rich surrounding country furnishes raw products sufficient for the support of a large manufacturing and commercial city. Pop. (1880) 7,295; (1890) 14,445; (1900) 20,686; (1910) 26,425.

ALLAN D. SANFORD,
Mayor.

Wad, a soft black mineral, consisting chiefly of the oxides of manganese, MnO_2 and MnO , but with varying percentages of one or more other metallic oxides and also water. Several prominent varieties and many minor varieties have been named, thus "bog manganese" contains iron, silica, alumina and baryta besides the usual much larger percentage of the manganese oxides and water. Asbolite or "earthy cobalt" contains oxide of cobalt up to 32 per cent. Lampadite contains from 4 to 18 per cent of oxide of copper. Wad frequently occurs in loosely aggregated masses which thus seem very light, but its specific gravity rarely falls below 3, and is sometimes as much as 4.26. Though usually so soft as to soil the fingers, its hardness may be as high as 6. Besides the common amorphous form, reniform masses and incrustations are frequently found, while beautiful arborescent infiltrations of wad occur in seams of quartz and other minerals (see Figure 12 under MINERALOGY). Wad and the closely related mineral psilomelane are important ores of manganese and occur abundantly in very many localities.

Wad. See GUNNERY.

Wadai, wā-dī', or **Waday**, Northeast Africa, an extensive and semi-civilized negro state in Central Sudan, between Kanem and Bagirmi in the west and Darfur in the east, since 1899 recognized as within the French sphere of influence. With dependencies its area is estimated at 170,000 square miles and its population at about 5,000,000. It consists principally of an elevated plateau, very fertile in some parts, producing abundantly maize, millet, indigo, cotton, etc. Ivory and slaves are also largely dealt in. The inhabitants are warlike, and exercise tributary rights over several neighboring settlements; their aggressive policy was somewhat checked by the Mahdi who inflicted a crushing defeat on the sultan of Wadai's forces in November 1888. This sultan, Ibrahim, was deposed in 1901 and succeeded by the present ruler, Abugazali. The kingdom of Wadai dates from 1635. The prevailing religion is Mohammedan. Capital, Abeche.

Waddell, wōd-dēl', James Iredell, American naval officer: b. Pittsboro, N. C., 13 July 1824; d. Annapolis, Md., 15 March 1886. He was appointed midshipman in the United States navy in 1841, became lieutenant in 1855, and in 1861 resigned his commission in order to join the Confederate navy the next year. He was engaged in the repulse of the Union forces at Drewry's Bluff, James River, Va., was sent to England by the Confederate government in 1863 and in 1864 took command of the Shenandoah, with which he began a piratical cruise against the commerce of the United States which lasted 13 months. He carried the Confederate flag around the world, captured 38 vessels and sailed under the Confederate flag for six months after Lee's surrender. He then turned his ship over to the British government which in turn transferred it to the hands of the United States consul at Liverpool. After residing for several years abroad Waddell returned to the United States and in 1875 became a commander in the service of the Pacific Mail Steamship Company.

Waddell, John Alexander Low, American engineer: b. Port Hope, Ontario, 15 Jan. 1854

He was graduated from Rensselaer Polytechnic Institute in 1875, and in 1876-7 was engaged in engineering work on the Canadian Pacific Railway. He was assistant professor of rational and technical mechanics at the Rensselaer Institute in 1878-88, and in 1882-6 was professor of civil engineering at the Imperial University of Japan. Since 1887 he has been engaged as a consulting bridge engineer. He is a member of various American and foreign societies, and in 1888 was decorated by the Emperor of Japan, Knight Commander of the Order of the Rising Sun. He has published: 'Designing of Ordinary Iron Highway Bridges' (1884); 'A System of Iron Railway Bridges for Japan' (1886); 'De Pontibus' (1898); 'Specifications for Steel Bridges' (1900); etc.

Wadding, wăd'ing, Luke, Irish Franciscan friar: b. Waterford, Ireland, 16 Oct. 1588; d. Rome 18 Nov. 1657. After studying theology at the Lisbon Jesuit Seminary he entered the Franciscan Order in 1605, and became professor of divinity in the University of Salamanca. He went to Rome in 1618, where he founded the Irish Franciscan College of St. Isidore (1625), served as papal councillor in the controversy with the Jansenists, whose tenets he held at first, but presently renounced; and was procurator of his order (1630-4). He wrote 'Annales Ordinis Minorum' (1626-40; new ed. 24 vols. 1731-47); 'Scriptores Ordinis Minorum' (1660; new ed. 1806); and edited Calasio's posthumous 'Biblical Concordance' (1621) and the works of Duns Scotus (1620).

Waddington, wăd'ing-tôn, George, English educator: b. Tuxford, England, 7 Sept. 1793; d. Durham, England, 20 July 1869. He was educated at Trinity College, Cambridge, and received a fellowship there in 1818. He traveled in foreign countries for several years, was appointed commissary and official of prebend at Masham in 1833; was prebendary of Ferring, Chichester Cathedral in 1833-41; and from 1840 until his death was dean of Durham. His writings include: 'Journal of a Visit to Some Parts of Ethiopia' (1822); 'A Visit to Greece in 1823 and 1824' (1825); 'History of the Church from the Earliest Ages to the Reformation' (1833); 'History of the Reformation on the Continent' (1843); etc.

Waddington, Samuel, English poet: b. Boston Spa, Yorkshire, 9 Nov. 1844. He was educated at Brasenose College, Oxford, became a contributor to the leading English journals and reviews, and besides editing several anthologies, such as 'English Sonnets by Living Writers' (1881), and 'Sonnets of Europe' (1886), published also: 'A. H. Clough: A Monograph' (1883), 'Poems' (1896), and 'Collected Poems' (1902).

Waddington, Fr. vâ-dân-tôn, William Henry, French statesman and diplomat: b. St. Remi-sur-l'Avre, Eure-et-Loir, 11 Dec. 1826; d. Paris 1; Jan. 1894. He was educated at Trinity College, Cambridge, England, for some years devoted his attention to archaeological research, was admitted in 1865 to the Académie des Inscriptions et Belles-Lettres, and did not enter politics until he stood unsuccessfully for the department of the Aisne in 1865 and 1869. Minister of public instruction in the extremely short-lived cabinet of Dufaure 19-24 May 1873, he was elected senator for the Aisne in 1876, and

was again minister of public instruction in 1876-7. In December 1877 he received the portfolio of foreign affairs, in 1878 took a distinguished part in the Congress of Berlin, and 4 Feb. 1879 became prime minister. His delay in the matter of needed reforms lost him the support of all parties, and he retired 27 December. He held the London embassy in 1883-93. His writings include editions of the edict of Diocletian (1864) and Le Bas' 'Voyage Archéologique' (1867-77); an essay on 'The Protestant Church in France' in 'Cambridge Essays' (1856), and 'Mélanges de Numismatique et de Philologie' (1861). Consult Mme. Waddington, 'Letters of a Diplomat's Wife' (1903).

Wade, wăd, Benjamin Franklin, American lawyer and political leader: b. near West Springfield, Mass., 27 Oct. 1800; d. Jefferson, Ohio, 2 March 1878. In 1821 he went to Ohio, where after spending a few years in farming he took up the study of law, was admitted to the bar in 1827, and in 1831 formed a partnership with Joshua R. Giddings (q.v.), and built up a large practice. In 1837 he was elected to the State senate as a Whig, where he procured a resolution against the annexation of Texas; he also opposed the Kentucky Slave Bill, and on this account failed of re-election in 1839; but was again elected in 1841. He took active part in the campaign of 1840, and in 1847 was elected the presiding judge of the 3d Judicial Court of Ohio, where he acquired high standing as a jurist. In 1851 he was elected to the United States Senate, and re-elected in 1857 and in 1863, thus serving throughout the Civil War. He was a firm opponent of slavery, voted to repeal the Fugitive Slave Law, and in opposition to the Kansas-Nebraska Bill. After the election of Lincoln in 1860, he opposed any compromise between the North and the South; from 1861-2 was chairman of the joint committee on the conduct of the war, and advocated a vigorous policy and the immediate emancipation of the slaves. In 1864 he opposed the policy of the President and moderate Republicans in regard to Reconstruction, and with Senator Davis issued the Wade-Davis manifesto strongly criticising the President's policy. He was elected president *pro tem* of the Senate, and was thus acting vice-president of the United States in 1865, after Lincoln's assassination. His ability in debate, fearlessness, and honesty gave him a leading position in the Senate and commanded the respect of his associates. Consult Riddle, 'Life of Benjamin F. Wade' (1886).

Wade, Sir Thomas Francis, English diplomatist: b. London 25 Aug. 1818; d. Cambridge 31 July 1895. He studied at Trinity College, Cambridge; entered the army in 1838; in 1841 was promoted lieutenant in the 98th regiment, detailed for service in China; and was successively interpreter at Hong Kong and vice-consul at Shanghai. From 1861 to 1871 he was a member of the British legation at Peking, and from 1871 to 1883 ambassador there. In 1888 he was made the first professor of Chinese at Cambridge University. His large and important Chinese library is now in the possession of that institution. He published 'The Peking Syllabary' (1859); 'Yü-yen Tsü-erh Chi: A Progressive Course in Colloquial Chinese' (1867); and other standard works on China and the Chinese.

Wadlai, wā-dē-lī', Central Africa, a military post in the equatorial province of the Egyptian Sudan, on the Nile not far below the Albert Nyanza. It is famous as the chief station of Emin Pasha (q.v.), governor of the province, who, after the Mahdist rising, was cut off from civilization, and who was relieved by Stanley.

Wadesboro, wādz'būr-ō, N. C., town, county-seat of Anson County; on the Seaboard Air Line and the Atlantic Coast Line R.R.'s; about 120 miles southwest of Raleigh and 50 miles southeast of Charlotte. It is in an agricultural region in which the chief products are cotton and tobacco. The principal buildings are the county court-house, the Anson School Institute, opened in 1854, and the churches and schools for both races. The two banks, one national and one state, had (1903) a combined capital of \$75,000. The national bank had deposits amounting to \$180,000. Pop. (1910) 2,376.

Wadham (wōd'am) College, Oxford University, England, was founded in 1610 by Dorothy, widow of Nicholas Wadham of Mayfield, Somersetshire, England, for a warden, 15 fellows, 15 scholars, two chaplains, and two clerks. One of the fellowships was diverted in 1857 to the endowment of the chair of experimental philosophy. The scholarships have an annual value of \$400, and are tenable for five years; and there are besides 10 Hody exhibitions (six Greek, four Hebrew) of \$250, two Wright exhibitions (1874) for scholars of Manchester grammar school, etc. Wadham College presents to 12 livings. The 17th century college buildings and the college garden are attractive features; the library is rich in rare Spanish books. Among Wadham's distinguished alumni are Admiral Blake and Sir Christopher Wren.

Wadi, wā'dé, or **Wady** (Arabian, "ravine"), in Palestine and Arabia, either a river or river valley, or the basin of a torrent. Renan thinks this word was adopted by the Greeks and corrupted into oasis. It has passed into the Spanish gual, with which many of the Spanish river names begin; thus Wadi-l-Kebir (Arab. "great river") appears as Gualdquivir, Wadi-l-hajarah ("river of stones") as Guadalquivir. The ravines of Malta commonly go by the name of wye or wied, a corrupted form of wadi.

Wadleigh, George Henry, American naval officer: b. New Hampshire 28 Sept 1842. He was graduated from the United States Naval Academy in 1863 and was assigned to blockade duty with the West Gulf Squadron, serving until the close of the war. He was commissioned master in 1865, commander in 1880, served on the Arctic expedition in search of the Jeannette in 1881, was promoted captain in 1894, and in 1895-7 was in command of the Minneapolis on the coast of Asia Minor, engaged in the protection of American missionaries. He commanded the flag-ship Philadelphia in the Pacific station during the Spanish war, and after the conclusion of peace was in command of the Wabash at the Boston navy-yard. In 1902 he was promoted rear-admiral and was retired several months later in that year.

Wadlin, Horace Orsely, American statistician: b. Wakefield, Mass., 2 Oct 1841. He studied architecture in Salem and in Boston, Mass., and in 1874-9 was engaged in the practice of that profession in the latter city. He

was appointed special agent for the Massachusetts Bureau of Statistics of Labor in 1879 and upon becoming its chief in 1888 abandoned his professional practice. He resigned this position in 1903 to accept the post of librarian at the Boston Public Library, which he has since occupied. He was a member of the Massachusetts legislature in 1884-8, was supervisor of the United States census in 1890 and in 1900, and also of the Massachusetts census of 1895. He has published: 'Reports on Statistics of Labor of Massachusetts' (14 vols., 1888-1901); 'Annual Statistic of Manufactures of Massachusetts' (16 vols., 1888-1901); 'Decennial Census of Massachusetts' (7 vols., 1895); etc.

Wadsworth, wōds'werth, James Samuel, American soldier: b. Genesee, N. Y., 30 Oct. 1807; d. 8 May 1864. He was educated at Hamilton College, Harvard, and Yale, though he was not graduated from any one of these institutions; studied law with Daniel Webster, and was admitted to the bar in 1833. He did not, however, practise his profession, his attention being given to the management of his extensive estates in western New York. He enlisted as a volunteer in the Union army early in 1861; was appointed a brigadier-general in August of that year; and became military governor of the District of Columbia in March 1862. In that year also he was the Republican candidate for governor of New York, but was defeated by his opponent, Horatio Seymour (q.v.). He was engaged in the battles of Fredericksburg, Chancellorsville, Gettysburg, and the Wilderness as commander of a division, and was mortally wounded in the last named battle, dying two days later.

Wadsworth, Ohio, village in Medina County; on the New York, Pennsylvania & Ohio Railroad; about 30 miles south of Cleveland and 15 miles west of Akron. It was settled in 1816, and in 1865 was incorporated. It is in an agricultural region in which tobacco is one of the important vegetable products. In the vicinity are large beds of coal, valuable sandstone quarries, and extensive deposits of fire-clay. There are also deposits of clay and other. The chief manufactures are door and window screens, wagons and carriages, steam injectors, flour, and machine shop products. There are eight churches, a normal school, graded public schools, and a library. There are two national banks which have a combined capital of about \$75,000 and deposits amounting to about \$400,000. Pop. (1910) 3,073.

Wady-Halfa, wā'dé-hāl'fā, Egypt, the capital of a second-class district in the Sudan, on the east bank of the Nile, one mile below the second cataract, and at the junction of the branch lines of the military railroad to Khartoum and Kerma. Its notable features are two ancient temples. Pop. with suburbs about 3,200.

Wafer, (1) A thin circular cake of unleavened bread, generally stamped with the Christian monogram, the cross, or other sacred symbol, and used in the Roman and several other churches in the administration of the Eucharist. (2) A small disk of dried pasta, used for sealing letters, etc.

Wager, a bet or something staked on the event of a contest or some unsettled question. The party whose opinion proved to be correct

WAGER POLICY — WAGNER

receives what has been staked by both. By statutes of England and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honor. See GAMBLING.

Wager, or Wagering, Policy, in insurance law, a pretended insurance, in which the insured possesses no legal interest in the subject-matter of the insurance or the risk insured against. Therefore it is really a wager between insurer and insured that the uncertain event referred to will or will not take place. The "stakes" of the insurer are represented by the sum insured; those of the insured, the paid premium. See INSURANCE.

Wages, the payment given for personal services, as contradistinguished from money received for anything sold: thus when an author publishes a book, or a shoemaker sells a pair of shoes, the sums received are not wages, although they are to the seller virtually the same thing. The term wages is now usually restricted to the money paid at short intervals for mechanical or muscular labor, the term salary being applied to the remuneration of the services of bank, railway, and other managers, overseers, and clerks, paid at longer intervals, as quarterly, half-yearly, etc.; and fee to money paid for the services of lawyers, doctors, paid at special times according to custom. As to the laws regulating the rise and fall of wages, see POLITICAL ECONOMY; also see UNIONISM.

Wagner, Charles, French Protestant leader: b. Wickersville, Alsace, 3 Jan. 1852. At the age of 14 he was sent to Paris to school; was graduated at the Sorbonne in 1869; and studied theology at Strasburg and Göttingen. He was the pastor of a small parish in the French province of Voages until 1882, when he went to Paris, and there opened a Sunday-school, and later began preaching. The publication of his book 'Jeunesse' ('Youth') in 1891 marked him as a leader in the ethical movement in France, and his influence has since continually increased. Besides serving as pastor to a large congregation, he has taken an active part in many philanthropic and charitable undertakings, and in this work comes into cordial relations with men of all shades of religious belief. His other publications translated into English include 'The Soul of Things'; 'By the Fireside'; 'The Better Way'; 'The Simple Life'; 'On Life's Threshold' (1905). Of these 'The Simple Life' has attracted particular interest in the United States and has been widely commended by religious and ethical leaders. In the fall of 1904, Pastor Wagner visited the United States, where he made numerous addresses.

Wagner, vāg'nēr, Moritz, German naturalist: b. Baireuth 3 Oct. 1813, d. Munich 31 May 1887. He studied at Erlangen and Munich, and made extensive scientific journeys, in 1852-3 through North and Central America and the West Indies; in 1857-60 through the Andes from Panama to Ecuador. He was made professor of geography and ethnology at Munich. Among his writings are: 'Travels in the Regency of Algiers' (1841); 'The Caucasus and the Land of the Cossacks' (1847); 'Journey to Colchis' (1850); 'Journey to Ararat and the Armenian

Highlands' (1848); 'Travels in Persia and in the Land of the Kurds' (1851); 'Scientific Travels in Tropical America' (1870); 'The Darwinian Theory and the Law of Migration of Organisms' (1868).

Wagner, Richard, German composer, creator of the modern music drama: b. Leipzig 22 May 1813; d. Venice 13 Feb. 1883. His father, a clerk in the police court, who had been appointed chief of police by Marshal Davoust during the French occupation of Leipzig, died when Richard was only six months old; and the widow, left with seven children, married, nine months later, Ludwig Geyer, a well-known actor, playwright, and portrait painter, as well as a tenor. His appearances at the opera in Dresden, where he lived, gave young Richard opportunity to become familiar with the operas then in vogue, his favorite being Weber's 'Freischütz' which made a deep impression on him and determined the direction of his own genius to such a degree that it has been aptly said that it was Weber who wrote the first 'Wagner Opera.' When Geyer died, Richard was eight years old, and he had not, up to that time, shown any special talent for music; indeed, he played the piano so badly that his teacher told him he would never amount to anything. His poetic talent began to manifest itself when he was 11. Shakespeare became his model, and at 16 he had completed a tragedy, a sort of compound of Hamlet and Lear, in which he killed off so many of the characters (42) that most of them had to be brought back as ghosts to prevent the play from coming to an untimely end. It was his desire to set this to music that first decided him, at 16, to become a musician. He took some lessons, and after a few preliminary trials, wrote a piece concerning which he himself said afterward that 'Beethoven's ninth symphony appeared like a simple Pleyel sonata by the side of this marvelously complicated overture.' These youthful extravagances were prophetic of the man who was to revolutionize the opera by his bold defiance of all conventions. In 1830 he entered the University of Leipzig as a student of philology and esthetics; but music claimed most of his attention, and he wrote, among other things, a symphony which showed such a remarkable mastery of the methods of classical composition as to indicate that he could have become one of the great masters in the concert field had not the inclination of his genius taken him into the operatic domain. He wrote his first opera at Würzburg, where he had secured an engagement as chorus master; it was entitled 'The Fairies,' but was not performed till five years after his death, at Munich.

His second opera, 'Das Liebesverbot' (based on 'Measure for Measure'), had a deservedly unsuccessful production at Magdeburg. Then he accepted an appointment as conductor at Königsberg, where he married a pretty actress, Minna Planer; and in the following year he moved again, to the Russian town of Riga, where he wrote the libretto and the music of the first two acts of 'Rienzi.' This opera was planned on such a big scale that he knew he never could have it properly produced at a provincial theatre, wherefore he boldly resolved to go to the headquarters of spectacular opera — Paris — and try there to rival the popular idol, Meyerbeer, in his own field. With his wife and

a huge Newfoundland dog he embarked at Pillau for London; the voyage lasted nearly four weeks; three times the ship was tossed by violent storms, and it was during these that Wagner got the realistic "local color" for his 'Flying Dutchman,' the story of which was engaging his attention at the time. Paris did not prove hospitable to the German musician. He tried in vain to have one of his operas produced; no one cared for the French songs he wrote, and which he was finally glad to sell in Germany at \$4 apiece, he could not even get a place as chorus singer in a Boulevard theatre. Luckily he found a music publisher, Schlesinger, who paid him for proof-reading and arranging popular melodies and operatic scores for piano and cornet and other instruments. Wagner also wrote some interesting musical essays and novelties which were printed and paid for, and which contain many autobiographic details. He completed 'Rienzi' and also wrote the music of the 'Flying Dutchman'; but finally after nearly three years of starvation and numberless disappointments left Paris for Dresden, whence he had received a request for his 'Rienzi.'

With the return to Germany begins the second period in Wagner's life. 'Rienzi' was produced at Dresden on 20 Oct. 1842, and proved such a brilliant success that there was a demand for his other opera, 'The Flying Dutchman,' which was given on 2 Jan. 1843, only about ten weeks after 'Rienzi.' This proved to be less of a success; the performance was poor, and the audience was puzzled and displeased when, in place of the usual airs and processions it found an opera without arias, duos, and dances—an opera so new in form and spirit that few could understand it. Only four performances were given. However, 'Rienzi' had made Wagner the hero of the day; he was appointed royal conductor, and kept that position about six years. His next opera, 'Tannhäuser,' departed more widely still from the accepted models. It was produced on 19 Oct. 1845 and, to Wagner's chagrin, seemed to give pleasure only in so far as it resembled the old-fashioned operas. However, he persevered in his path of reform and wrote 'Lohengrin.' It was finished in 1848, but he could not even get it accepted for performance. Nor could he get any attention for his plans for reforming the Dresden Opera. He became more and more dissatisfied with his position, and when, in 1849, the revolution broke out, he foolishly joined the insurgents. The result was that he had to seek safety in flight; his companions were caught and imprisoned, while he succeeded in reaching Weimar, where Liszt took care of him and provided him with the means of escape to Switzerland. In that home of political refugees he dwelt during most of the years—more than a decade—that he was exiled from Germany. For six years he composed no more operas, devoting his time to writing essays on musical and dramatic subjects by way of explaining his theories. Little attention was paid to these, and he might have starved but for the assistance of Liszt and other friends. All this time the plans for his great 'Nibelung Tetralogy' were slowly maturing in his mind. In 1852 the poems were finished and printed and on 1 Nov. 1853, he began to write the music for 'Rheingold'; it was finished the following year and 'Die Walküre' was completed by March

1856. In the meantime he had unwisely accepted an offer to conduct a series of Philharmonic concerts in London (1855). Queen Victoria and the public were kind to him, but the press treated him shamefully, his music being described as an "inflated display of noise and extravagance," as void of melody, etc. He got only \$1,000 for four months' work. Returning to Switzerland, he finished 'Die Walküre' and began the third opera of the Nibelung Tetralogy, 'Siegfried.' When he had got to the middle of the second act, he despaired of ever finishing and producing this great cyclic work, and so abandoned it for the time being (in June 1857) and began his 'Tristan und Isolde,' which, being a separate work, would, he hoped, re-establish his connection with the stage. He completed it in 1859, but seven years elapsed before he succeeded in producing it. In 1860 he gave a series of concerts in Paris; they resulted in a large deficit. In the following year Napoleon ordered a performance of 'Tannhäuser.' Wagner was given to understand that he must introduce a ballet in the second act; he refused to do so, and the members of the Jockey Club took their revenge by creating such a disturbance that Wagner refused to allow more than three performances to be given. He thus received only \$150 for a year's hard work. Immediately after this disaster he wrote the poem for his only comic or humorous opera, 'Die Meistersinger,' of which he had made a sketch as early as 1845.

It was while composing this opera that the most important event of his life happened. He seldom had much money, but when he had he spent it with artistic lavishness, nor did he hesitate to live beyond his means. The failure, through no fault of his, of a Russian concert project, left him so deeply in debt in Vienna, that, to escape prison, he had to hide in Germany. On 3 May 1864, he was preparing to disappear in the Swabian Alps, there to complete his 'Meistersinger' score, when a message arrived from the new king of Bavaria, Ludwig II., who invited him to come to Munich to live there at his expense, to compose operas, and produce them. Wagner wept for joy, and promptly proceeded to Munich, where 'Tristan und Isolde' was produced on 10 June 1865, and 'Die Meistersinger' on 21 June 1868. But Wagner's enemies made life so unpleasant for him that he left Munich and took up his abode in a villa on Lake Lucerne, where, after completing his comic opera, he took up 'Siegfried' and finished that (1869). The fourth and last opera of the Tetralogy, 'Götterdämmerung,' was not completed till 1874. His plan of having a special theatre for the Tetralogy built in Munich, having failed, notwithstanding the king's friendship, he now chose Baireuth as the best place for such a theatre, in which his novel work could be presented in exact accordance with his intentions. To secure the large sum needed, Wagner societies were founded in the cities of Europe and America. In August 1876, three complete performances of the Tetralogy were given, before audiences including two emperors, a king, and many musical and other celebrities. But the deficit of \$37,000 discouraged a repetition of the festival. In 1882, however, after the completion of 'Parsifal,' another was held devoted entirely to that work; 20 performances were given in July and August. In the following February,

Wagner died at Venice and his remains were taken in a special funeral train to Baireuth. After his death his widow (Cosima, the daughter of Liszt, whom he had married in 1870, four years after the death of his first wife) continued the festivals, which soon became enormously profitable. 'Parsifal' remained a Baireuth monopoly until 24 Dec. 1903, when Manager Conried produced it at the Metropolitan Opera House, New York, the receipts being over \$200,000 for 12 performances.

In personal appearance Wagner was barely of medium stature; his head was large in proportion to his body, his forehead massive, his chin prominent, his lips refined, his eyes keen, yet kindly in expression. His life was full of disappointments, which left their traces in the lines of his face. He was 44 years old before any of his operas were heard in Vienna, Munich or Stuttgart, and 56 before any of them were sung outside of Germany. This, of course, was largely due to the fact that he refused to make any concessions to popular taste, except in 'Rienzi.' The next three operas—'Flying Dutchman,' 'Tannhäuser,' and 'Lohengrin'—created an entirely new style, and by the time the public had become accustomed to that, he made another equally great step forward in his 'Tristan,' 'Meistersinger,' 'Nibelung Tetralogy,' and 'Parsifal.' These were derisively referred to as 'music of the future,' by way of burlesquing his idea of the 'art work of the future.' This idea was that music, sculpture, poetry, painting, and architecture had had their day as separate arts, and that the art work of the future was the music-drama, in which all these arts are united inseparably. His wonderful pictorial imagination is best exemplified in 'Parsifal.' Being almost as great a poet as he was a composer, he always wrote his own librettos, whose theatric and literary merits place him among the world's greatest playwrights, although they must not be judged apart from the music any more than the music must be judged apart from the plot, the scenery and the action. He preferred mythical, supernatural subjects to the historic. His operas are not, like those of his predecessors, a mere mosaic of unconnected arias, duos, choruses, and orchestral interludes, but, especially in those of the last period, every part is connected with every other part by means of leading motives, or characteristic musical phrases which are associated with a particular person, incident, or dramatic emotion, and which recur in the music whenever the person or dramatic idea with which they are associated recurs in the play. This practically gives the faculty of definite speech to the orchestra, the beauty and emotional power of which he further enhanced beyond all precedent by an endless variety of new tone colors and expressive harmonies. He also created an entirely new style of dramatic vocalism, which it took the singers years to master, but with which they are now celebrating their greatest triumphs; to-day Wagner's operas are more popular and profitable than any others. Apart from his operas, the list of Wagner's works includes some mediocre piano-forte pieces, several good songs, and, for orchestra, the 'Siegfried Idyll,' and three marches, the 'Huldigungsmarch,' the 'Kaisermarch,' and the 'Philadelphia Centennial.' This last, like his other miscellaneous works, is mediocre. His

literary works comprise ten volumes of dramatic poems and essays on musical and philosophical subjects, some of them wordy and wearisome, others extremely keen and suggestive; English version by Ellis, who is also translator of Glasenapp's monumental biography in 5 or 6 vols. The letters of Wagner to Liszt and other friends are extremely valuable; full use is made of them in the most elaborate biography in the English language, by Finck (1893). Other biographic and critical books are by Julien (1886), Tappert (1883), Muncker (1891), Liszt, Wolzogen (1883), Pohl, Nohl, Forges, Hoeffer, Chamberlain (1892), Nietzsche, Schuré, Kufferath, Oesterlein, Dannreuther (in Grove), Henderson (1901), Krebbs (1891), Kobbé, Newman, Weissheimer; thematic guides by Wolzogen, Kobbé, Heintz, Freda Winworth.

HENRY T. FINCK,

Musical Director New York 'Evening Post.'

Wagner, Rudolf, German physiologist: b. Baireuth, Bavaria, 30 July 1805; d. Göttingen, Germany, 13 May 1864. He was educated at Erlangen, Würzburg, and at Paris, was appointed professor of zoology at the University of Erlangen in 1833, and in 1840 was called to that chair at the University of Göttingen, where he remained until his death. He published: 'Lehrbuch der vergleichenden Anatomie' (2 vols., 1834-5); 'Handwörterbuch der Physiologie' (4 vols., 1842-3); 'Vorstudien zu einer wissenschaftlichen Morphologie des menschlichen Gehirns als Seelenorgans' (2 vols., 1860-2); etc.

Wagner, Siegfried, German musical conductor, son of Richard Wagner (q.v.): b. Lucerne, Switzerland, 6 June 1869. He was intended for an architect, but being bent on adopting the profession of his father, he left the Polytechnic school and studied music under Kniese and Humperdinck. He became a musical conductor in 1893, traveling in this capacity on the Continent and in England, and in 1896, and again in 1899, conducted the performances of 'Der Ring des Nibelungen' at Baireuth. He is the composer of the operas 'Der Bärenhäuter' to his own text (1899), and 'Hörner Wildfang' (1901); and various orchestral pieces.

Wagon, a four-wheeled vehicle for the transport of goods or passengers, drawn generally by horses. To enable the vehicle to turn as quickly and in as little space as possible, the fore pair of wheels are often made smaller than the hind pair, and to increase this advantage still further the axle of the fore-wheels is frequently fixed to the bottom of the vehicle by a swivel joint, in which case the shafts are attached to the fore-axle. The framework of the wagon is usually mounted on springs.

Wagram, vä'grām, Austria, a village on the left bank of the Rossbach, 12 miles north-east of Vienna, famous for the great battle between the French under Napoleon and the Austrians under the Archduke Charles, on 5 and 6 July 1809. Napoleon had obtained reinforcements after the severe loss which he sustained at Aspern and Essling, and was able to throw an army of 150,000, with 550 cannon, across the Danube on 5 July. The Austrians, who occupied a strong position at Wagram, were immediately attacked, but the first day with little success. On the following morning the archduke fell upon the French centre under

WAGTAIL—WAHIAKUM

Masséna, and then upon their left, producing confusion ending in total rout. A successful attack upon the Austrian left and centre by Davoust and MacDonald compelled the archduke to retreat, which he did leisurely and in good order, carrying with him about 7,000 prisoners, but leaving behind him 25,000 dead and wounded on the field, the French loss being probably about equal. On the 12th an armistice was signed at Znaim, and negotiations were commenced for a peace, which was concluded on the 14th October at Schönbrunn, and by which Austria ceded all her seacoast to France; Bavaria and Saxony were enlarged at her expense; part of Poland in Galicia was given to Russia, and Joseph Bonaparte was acknowledged king of Spain.

Wagtail, a small passerine bird of the family *Motacillidae*, so called from the habit of jerking the long tails when running or perching. In this family, which also includes the pipits (*Anthus*) or titlarks (q.v.), the bill is slender, straight, and notched at the tip; the tarsi very long and slender for a passerine bird; the wing with nine primaries and elongated inner secondaries, and the tail long. About 100 species are known, most of them belonging to the Old World. North America has four species of pipits and three wagtails, one of which (*Budytes flavus*) is abundant in Alaska, the others (*Motacilla alba* and *M. ocularis*) are stragglers from Europe and Asia, respectively. The wagtails inhabit meadow-lands and pastures, and frequent pools and streams. They are agile runners, and have an easy, undulating flight. The food consists of insects, worms, snails, etc., especially such as may be found by wading. Their nests, built on the ground, contain from four to six eggs. A well-known European species is the pied wagtail (*Motacilla yarrelli*), a permanent resident in Great Britain. The white wagtail (*M. alba*) is common in France and southern Europe, is widely distributed in Asia, and occasionally wanders to Greenland; it resembles the preceding species, but is rather slender in form, and has the throat and part of the head and neck alone black, the general color of the upper parts being of a light ash gray. The blue-headed wagtail (*Budytes flavus*) is about 6½ inches long, yellowish green above, bright yellow below, the head bluish gray except for the yellow throat and white superciliary stripe. This species is distributed extensively over Europe and Asia, and breeds plentifully in Alaska. The nest is formed of roots and moss sometimes lined with feathers, and placed in a hollow on the ground. The name of water wagtail, sometimes applied to the pied wagtail in England, is in the United States often given to the water-thrush (*Seiurus noveboracensis*), one of the warblers (q.v.).

Consult: Dresser, 'Birds of Europe'; Seebohm, 'Birds of Asia'; and the writings of Nelson, Turner, and Murdoch on the ornithology of Alaska.

Wah, the Nepalese name of the panda (q.v.).

Wahabees, wā-hā'bēz, **Wahabia**, or **Wahabites**, a Mohammedan sect, founded in Arabia about 1745 by Abd-el-Wahāb, a merchant as well as an oriental scholar of high attainments, who could not help observing the corruption both in doctrine and in practice

prevalent among the professed sons of Islam, especially the Turks. He deemed it his mission, not to teach a new religion, but to purge the innovations and errors which had crept into the old faith, and to restore the doctrines and observances to strict harmony with the teachings of the Koran and the Sunna. He inveighed against the idolatrous veneration for the Prophet and other saints, denying the intercession of saints altogether. He was an enemy to the gaudy decorations of the mosques and the rich dresses worn by the Turks, and strictly prohibited the use of tobacco. All who should oppose this reformation were to be destroyed by fire and sword. The first of Abd-el-Wahāb's important converts was the young and ardent chief Sa'ūd (or Saoud), who ruled over the little territory surrounding the fortified town of Derayah (or Dureeyeh), and who afterward became the son-in-law of the reformer. Abd-el-Aziz and Ibn Sa'ūd, the son and grandson of this chief, carried their arms to the utmost limits of the Arabian peninsula, subjugating and converting numerous tribes of Bedouins, and plundering the treasures of the mosques. The province of Nejed became the chief seat of their power, but Sa'ūd II. soon extended it over the greater part of Arabia, over which he administered justice in the manner of the caliphs. In 1803 he captured Mecca, and soon conquered Hejaz. The loss of the sacred city at last roused the Turks to action, and Mehemet Ali, pasha of Egypt, was appointed in 1804 to the task of crushing the fanatics. Nothing of importance, however, was done till 1812, when the Egyptians took Medina and drove the Wahabees out of Hejaz. In 1815 Ibrahim Pasha undertook an expedition to central Arabia to crush the power of the sect at once and forever; but it was not until 1818, after much hard fighting, that he fairly succeeded in dispersing the Wahabee forces and taking their capital, Derayah, which he laid in ruins. Abdalla, the son and successor of Sa'ūd, and some of his ministers, were made prisoners, and sent off to Constantinople, where they were executed. The Egyptians were not able to maintain the supremacy which they had acquired; gradually the Wahabees regained their influence in the centre of the peninsula; and soon after the death of Mehemet Ali, in 1849, the Egyptians gave up the struggle. Palgrave visited them in 1863, and Col. Pelly in 1865, and published the fact that the Wahabees, under the rule of Feysul, at once their emir (temporal ruler) and imam (spiritual chief), extended their sway over a wider territory than ever before, and threatened to control by their arms and influence the whole peninsula. Since 1870, however, their power has been on the decline. Numerous fanatical Mohammedan bodies, evidently allied to the Wahabees, have settled in India, and by their turbulence and conspiracies have caused great uneasiness to the British government. Consult: Palgrave, 'Travels in Arabia'; Hunter, 'Our Indian Mussulmans' (1876); Burckhardt, 'Notes on the Bedouins and Wahabys' (1834).

Wahkiakum (the name of a former chief). A tribe of the Chinookan stock of North American Indians, formerly living near the mouth of Columbia River, in Washington. They were originally a part of the Chinook tribe, but sep-

WAHL--WAILATPUAN INDIANS

arated in the latter part of the 18th century, under Chief Wahkiakum, whose name they afterward assumed. They were first noted by Lewis and Clark. A county in southwestern Washington bears their name.

Wahl, William Henry, American scientist: b. Philadelphia, Pa., 14 Dec. 1848. He was graduated from Dickinson College, Carlisle, Pa., in 1867, studied at the University of Heidelberg, and subsequently made a special study of mineralogy, geology, and chemistry. He was professor of physics and physical geography at the Central High School at Philadelphia in 1873-4; resident secretary at the Franklin Institute; and editor of the 'Journal' of Franklin Institute in 1870-4, and in 1876 became editor of the Philadelphia 'Polytechnic.' He was associate editor of the 'Engineering and Mining Journal' in 1878-80, editor of the New York 'Manufacturer and Builder' in 1880-2 and then resumed his former post at the Franklin Institute, which he still holds. He has published 'Galvano-plastic Manipulations' (1883); 'Preparations of Metallic Alloys' (1893); 'Historical Sketch of the Franklin Institute' (1894); etc.

Wahoo, wā-hoo', Neb., city, county-seat of Saunders County; on Cottonwood Creek, and on the Chicago, B. & Q. and the Fremont, E. & M. V. R.R.'s; about 45 miles west of Omaha. It is in a fertile agricultural region in which the principal products are wheat and corn. The chief shipments are wheat, corn, and live-stock. There are 11 churches, a high school, elementary schools, and a public library. The Luther Academy, under the auspices of the Evangelical Lutheran Church, was chartered in 1883. The three banks, two national and one state, had, in 1903, a combined capital of \$150,000 and deposits amounting to \$545,960. Pop. (1910) 2,168.

Wahoo. See WAHOO.

Wahow'pum ('willow people'), a small tribe of the Shahaptian stock of North American Indians, occupying the village of Hahau on the north bank of Columbia River, near the mouth of Olive Creek, in Klickitat County, Washington. They have never been officially recognized.

Wahpekute ('shoot among deciduous trees'), a division of the Santee of the Dakota confederacy of the Siouan stock of North American Indians. They are now officially regarded as 'Santees,' of whom there are 1,300 under the Santee Agency, Nebraska.

Wahpeton, wā'pē-tūn (*Wā'pē-tōng-wong*, 'dwellers among deciduous trees'). A division of the Dakota confederacy of the Siouan stock of North American Indians. Like the other Dakota tribes they lived largely by hunting and were noted warriors. There are now 1,030 Sissetons, 'cut-heads,' and Wahpetons under the Devils Lake agency, North Dakota, and 1,950 Sissetons and Wahpetons under the Sisseton agency, South Dakota, but the numbers of the individual tribes are not known. See McGee, 'The Siouan Indians,' 15th Rep. Bureau of American Ethnology, Washington, 1897.

Wahpeton, wā'pē-tūn, N. D., city, county-seat of Richland County; at the confluence of the Red River of the North and the Sioux Wood River, and on the Great Northern, the

Northern P., and the Chicago, M. & St. P. R.R.'s, opposite Breckenridge, Minn., and about 43 miles south of Fargo. It was settled in 1872 by M. T. Rich; became a village in 1881; and in 1884 was chartered as a city. The chief industrial establishments are flax fibre works, flour mills, machine shops, wagon factory, and lumber mills. It has grain elevators and lumber yards. The principal buildings are the county court-house, churches, and schools. There are eight churches. The educational institutions are the Red River Valley University, the State Academy of Science, the Lutheran Bible School, and public and parish schools. The three banks have a combined capital of \$160,000. The government is vested in a mayor and a council of six members elected biennially. About one half the population are Scandinavians, Germans, and Bohemians combined, the rest are American-born. Pop. (1910) 2,467.

F. FALLEY,
Editor 'Globe.'

Wahsatch (wā'sāch) Mountains, a range in Utah, the eastern boundary of the Great Basin, extending from the northern boundary of the State south nearly to the Colorado River. Several peaks are nearly 12,000 feet high; at the base and among the foot-hills are deep cañons. Silver in large quantities is found in these mountains. See also ROCKY MOUNTAINS; UTAH.

Waiam, wī'am (so called from their principal village), a small tribe of the Shahaptian stock of North American Indians, also known as Des Chutes, Wyams, etc. Their chief village was on the Columbia River, where Celilo now is. They took part in the Wasco treaty of 1855 and are now on Warmpring Reservation, Oregon.

Wailatpuan (wī'ē-lāt'poo-an) Indians (Wai'lētpu, plural of Wai'ēlet, 'one Cayuse man'), a linguistic stock of North American Indians, consisting of the Cayuse and Molala tribes. The former originally occupied the mountain country on the heads of Wallawalla, Umatilla, and Grande Ronde rivers in Oregon and Washington; the Molala resided on Molala Creek, west of the Cascades in Oregon. The former tribe bore a high reputation for intelligence and bravery, but on account of their fighting propensities, which led them to make constant war against the Shoshoni and other tribes to the west, they were never very numerous. In 1838 a Presbyterian mission had been established among them by Dr. Marcus Whitman, at the site of the present Whitman, Washington. In 1847 smallpox carried off a large part of the tribe, and the Indians, believing the missionaries to be the cause of it, attacked and destroyed the mission on 27 November, and killed Whitman and 13 others. In 1854 the Cayuse numbered 126, of whom there were but few pure-bloods, the majority being intermixed with Nez Percés and Wallawallas. Of the 374 so-called Cayuse now on Umatilla Reservation, Oregon (which they share with the Umatillas and Wallawallas), only a few retain their own language. This reservation was set aside in 1855. There are perhaps two dozen survivors of the Molala tribe on Grande Ronde Reservation, Oregon. See Mooney, 'Ghost Dance Religion,' 14th Rep. Bur. Amer. Ethnology, Washington, 1891.

Waikato, wīka-tō, New Zealand, the principal river of North Island, flows first into Lake Taupo, and then out of it north to Manakau harbor on the west coast with a total course of 170 miles. Mercer, Hamilton, and Havelock, are the chief towns along its banks. Between the Upper Waikato, Lake Taupo, Mount Ruapehu, and the west coast lies the mountainous and picturesque "King Country," occupied mainly by Maoris under their king, who till 1884 resolutely opposed the survey or settlement by Europeans of the lands within their *whenua* or frontier.

Wainwright, wān'rit, Thomas Griffiths, English art critic and forger: b. Chiswick October 1794; d. Hobart Town, Tasmania, 1852. He studied art in London, wrote art critiques for the 'London Magazine,' on which Lamb, Hood, Cunningham, Hazlitt, and De Quincey were at the time (1820-3) collaborators, and exhibited at the Royal Academy in 1821-50. In 1826 he forged an order on the Bank of England for £2,250, in 1837 was sentenced at the Old Bailey to transportation for life to Van Diemen's Land (Tasmania). He was also believed to have been concerned in several poisoning cases, to obtain money. He appears as Varney in Bulwer's 'Lacretia,' and Dickens' 'Hunted Down' was based on his career.

Wainwright, wān'rit, Jonathan Mayhew, American Protestant Episcopal bishop: b. of American parents, Liverpool, England, 24 Feb. 1793; d. New York 21 Sept. 1854. He was graduated at Harvard College in 1812; studied theology and took holy orders, and was rector of Grace Church, New York, 1821-34. He was rector of Trinity Church, Boston, 1834-8, and assistant in charge of St. John's Chapel, New York, from the last named year till November 1852, when he was consecrated provisional bishop of New York. He was one of the founders of the University of New York, and was considered one of the most eloquent American pulpit orators of his time. His publications include: 'Sermons on Religious Education' (1820); 'Lessons on the Church' (1835); 'The Pathway and Abiding Places of Our Lord' (1851); 'The Land of Bondage' (1852); etc.

Wainwright, Richard, American naval officer: b. Washington, D. C., 17 Dec. 1849. He was graduated from the United States Naval Academy in 1868, was promoted lieutenant in 1873, lieutenant-commander in 1884, and was executive officer on board the battleship Maine at the time of her destruction in Havana Harbor in 1898. In the war which followed he was in command of the Gloucester and took part in the naval battle at Santiago 3 July 1898, in which he destroyed the Spanish torpedo boats Furor and Pluton. He was superintendent of the Naval Academy in 1900-2 and in 1903 was assigned to the command of the Newark.

Wait, John Cassan, American lawyer and civil engineer: b. Norwich, N. Y., 4 June 1860. He was graduated from Cornell as a civil engineer in 1882, and from the Harvard Law School in 1891. In 1887-94 he was instructor and assistant professor at Harvard and in 1896-7 was in charge of the New York State canal improvements. He was associate editor of the 'Railroad Gazette' in 1894-5, assistant corporation counsel for the city of New York in 1900-3, and has published: 'Car Builders'

Dictionary' (1895); 'Engineering and Architectural Jurisprudence' (1897); 'Law of Contracts' (1901); 'Poems of Industry and Labor'; 'Calendar of Invention and Discovery' (1903); etc.

Waite, wāt, Morrison Remick, American jurist, 7th chief justice of the United States: b. Lyme, Conn., 29 Nov. 1816; d. Washington, D. C., 23 March 1888. He was graduated from Yale in 1837; studied law, and in 1838 moved to Ohio, where he was admitted to the bar in 1839. He began the practice of his profession in Maumee City, later moving to Toledo. In politics he was at first an active and influential member of the Whig party, and was elected to the Ohio State legislature in 1849; later he took part in the organization of the Republican party; was an ardent supporter of Lincoln; and was nominated for Congress in 1862, but failed of election. His national reputation dates from the time of his appointment by President Grant as one of the counsel to represent the United States before the tribunal for the consideration of the Alabama claims at Geneva; associated with him were Caleb Cushing and William M. Evarts, the latter a college class-mate. His reply to Sir Roundell Palmer, establishing Great Britain's liability for permitting the Confederate cruisers to coal in British ports during the Civil War, was considered a model of legal argument in its clear, direct, and logical presentation of the law and facts. In 1873 he was chosen by both political parties as a delegate from his county to the convention for revising the State Constitution of Ohio, and was made president of that convention. In the same year he was appointed chief justice of the national Supreme Court, the appointment being approved by a unanimous vote of the Senate. Many of the most important subjects of adjudication came before the court during his term of office. Among them were the following: The constitutionality of the enforcement act; interpretation of the latest constitutional amendments; rights and powers of the State to control and regulate the charges of railroads; the polygamy cases; federal control over elections; power of the president to remove from office; power of States to prohibit the liquor traffic; repudiation of State debts and the true meaning of the 11th amendment; questions arising out of the violence of the Chicago anarchists, and the exclusion of the Chinese. His work was marked by the strictest attention to detail, and by a rigid enforcement of the rules and precedents of practice of the court, it was his custom to keep watch of the docket and acquaint himself in advance with the character of the cases about to be reached. In all questions his decisions were entirely uninfluenced by political considerations; and all parties and sections united in commending his absolute fairness. A prominent lawyer of the South said of him: "He could hold in his steady and equal hand the balance of justice undisturbed."

Waits, the name formerly given in England and other countries to the king's minstrels, whose duty it was to guard the streets at night and proclaim the hour. The name was afterward applied to the town's musicians, who, however, did not perform the duties of watchmen; and to private bands, when employed as serenaders. At present the waits are musicians who play during the night hours on the approach

WAKASHAN INDIANS—WAKE FOREST COLLEGE

of the Christmas or New Year seasons, and call at the houses of the inhabitants for donations. While this custom exists to some extent in the United States, the term "waits" is not used here.

Wakashan (wā'ka-shān) Indians (from *Wakash*, the Nootka word "good," which, when heard by Capt. Cook, was supposed to be the tribal name), a linguistic stock of North American Indians, consisting of the Aht and Haeltruk divisions with their numerous tribes, occupying the northern half and the western part of the southern half of Vancouver Island, the opposite mainland of British Columbia, and a small area about Cape Flattery inhabited by the Makah, one of the Aht tribes. The stock has also been referred to as Nootka and Nootka-Columbian, the term Nootka being the first name applied to the Mowachat, an Aht tribe. Of the Aht division there are some twenty tribes, numbering in all about 3,100 individuals, of whom there are 414 Makah under the Neah Bay Agency, Washington, the remaining tribes being under the West Coast Agency of British Columbia. The 17 Haeltruk tribes number in all about 2,500 souls, of whom about 1,900 are under the Kwakweweth Agency, British Columbia.

Wakatipu, wā'ka-tē'poo, New Zealand, a picturesque lake in the South Island with an area of 112 acres. Queenstown and Glenorchy, on the borders of the lake, are favorite tourist resorts, on account of the magnificent mountain scenery in the vicinity.

Wakayama, wā'kā-yā'mā, Japan, a town on the island of Hondo, situated on the east coast of the channel leading into the eastern end of the Inland Sea, 35 miles by rail southwest of Osaka. It is an important centre of the cotton industry. Its noted features are the princely Kishu palace, and the beautiful temple of Kijimijdera said to have been founded in 770 A.D.

Wake, Charles Standland, American anthropologist: b. England 22 March 1835. He was educated at Hull College, England, has been prominently connected with various English and American anthropological societies, originated a system of color and musical-tone relations and is at present connected with the Field Columbian Museum in Chicago. He has written: 'Chapters on Man' (1862); 'The Evolution of Morality' (1878); 'The Origin and Significance of the Great Pyramid' (1882); 'The Development of Kinship and Marriage' (1889); 'Serpent Worship and Other Essays' (1885); 'The Geometry of Science' (1899).

Wake, William, English prelate: b. Blandford, Dorsetshire, 26 Jan. 1657; d. Lambeth 24 Jan. 1737. He was graduated from Oxford, took orders in the Anglican Church in 1676, and in 1688 he became preacher at Gray's Inn. In 1689 he was appointed chaplain in ordinary to William and Mary, and also received a canonry of Christ Church, Oxford. From 1693 to 1706 he was rector of Saint James', Westminster, became canon residentiary and dean of Exeter in 1703, from 1705 to 1716 he was bishop of Lincoln. In 1716 he was enthroned archbishop of Canterbury. He took part in negotiations during 1717-20 for the union of the Anglican and the Gallican churches, and in his

relations with Nonconformists showed a liberal spirit. His chief works are: 'The State of the Church and Clergy of England in their Councils, Synods, Convocations, Conventions, and their other Assemblies, historically deduced' (1703); 'The Genuine Epistles of the Apostolical Fathers' (1693); and 'Principles of the Christian Religion in a Commentary on the Church Catechism.'

Wake, a term corresponding originally to *vigil*, and applied to an annual festival held on the anniversary of the day on which the parish church was consecrated and dedicated to a saint, the celebration being begun on the preceding day (the eve or vigil). On the eve of the anniversary the parishioners attended service in the church, the floor of which was strewn with flowers and rushes, and the altar and pulpit were decorated with boughs. Tents were planted in the church-yard to supply the people from surrounding parishes who crowded in on the morrow, that day being observed as a holiday. They soon degenerated into mere country fairs, and were long characterized by wild riot and licentiousness. Statutes were at various times directed against holding markets in churchyards and showing all goods except necessary refreshments on the great church festivals, but they seem to have been little regarded. Country wakes on some saints' festivals are still kept up in certain English parishes.

A *lyke* or *liche wake* (Anglo-Saxon, *lic*, a corpse) is the watching of a dead body by night by the relatives and friends of the deceased. The custom arose no doubt from the dread of remaining alone all night in the presence of the dead or from the fear that malignant spirits would interfere with the corpse. The practice, once general, is now confined in the United States, to a part of the foreign element, and is on the decline with them. Wakes are sometimes attended by scenes of disorder and intoxication, but as a rule they are conducted with decency, and show sincere respect for the dead.

Wake Forest College, located at Wake Forest, N. C., 16 miles northeast of Raleigh. It was chartered in 1833 as the Wake Forest Institute, under the auspices and control of the Baptists of the State; it was first opened to students in 1834, and in 1838 the charter was amended, its privileges enlarged, and the name changed to Wake Forest College. The greater part of the endowment was lost during the Civil War, but the college continued its work and regained its financial prosperity. The system of independent "schools" is now an established feature of the college organization; these schools are 15 in number, as follows: Latin, Greek, English, modern languages, mathematics, astronomy, chemistry, biology, physics, moral philosophy, history and political science, the Bible, pedagogy, law, and medicine. There are preparatory courses offered in Latin, Greek, mathematics and English. The college confers the degree of A.B., B.S., LL.B., and A.M. (for graduate work). In the A.B. and B.S. courses a part of the work is elective, the electives being somewhat limited, however, in accordance with the degree to be obtained. For the degree of LL.B. the full course in the School of Law must be completed, also the course in the School of History and Political Science. Students are admitted to the School of Medicine, either as

WAKE ISLAND—WAKEFIELD

medical students or as undergraduates, if taking the B. S. course. The completion of the course admits to the third year of any good medical school. With the aim of encouraging ministerial education, it has been the custom of the college to organize a special class, studying different phases of pastoral work or theology, this is outside the regular work of the School of the Bible, and does not count toward a degree; a pastors' course of one month was inaugurated in 1902 for those pastors who could obtain a month's leave of absence from their churches. The college has a pleasing location on high ground; its buildings include the main building, the Heck and Williams Building (library), the Wingate Memorial Building (chapel and audience hall), the Lea Laboratory (chemistry) and the Gymnasium. The productive fund in 1910 was over \$345,000; the library contained 23,000 volumes, the students numbered 379, and the faculty 34.

Wake Island, an islet of rock in the Pacific Ocean, lying 1,550 miles northeast of Guam, and 3,000 miles east of the eastern coast of Luzon, Philippines. It belongs to the United States as a Pacific outpost of the Philippine Archipelago. It is about one square mile in area, and its importance is due to the fact that it is on the cable route between the United States and the Philippines.

Wakefield, Edward Gibbon, English colonial statesman: b. London 20 March 1796; d. Wellington, New Zealand, 16 May 1862. Educated at Westminster School and Edinburgh High School, he became associated in a subordinate capacity with the legations at Turin and Paris. About 1826 he turned his attention to colonial affairs and worked out the scheme of colonization usually known by his name. Its cardinal features were the abolition of free grants of land for agricultural purposes (then so readily obtained that none cared to remain dependent, and laborers were at once transformed into landed proprietors); and the careful control of emigration. His views were first publicly expressed in 'A Letter from Sydney' (1829). The National Colonization Society was founded in 1830 to carry out his ideas, and in the following year his plan was adopted by the government for New South Wales. The South Australian Association was formed in 1834, and included many eminent men, and under its auspices the colony of South Australia was founded in 1836 on Wakefield's principles. He accompanied Governor-General Lord Durham to Canada in 1838 as adviser, and had an important share in drawing up the report in which Durham embodied his proposals for settling the Canadian difficulty. Wakefield was the moving spirit behind the New Zealand Association of 1837, which forced the British government to annex New Zealand. He was subsequently a prime mover in founding the Anglican settlement in New Zealand, and in 1852 he went to New Zealand and plunged into colonial politics. After the breakdown of his health in 1854 he lived in retirement till his death. All subsequent English colonial development has followed the ideas formulated by Wakefield. He was equally able as a theorist and a director of practical details. Consult. Rusden, 'History of New Zealand' (1883); Gisborne, 'New Zealand Rulers and Statesmen' (1892); Garnett,

'Life' in 'Builders of Greater Britain' series (1898).

Wakefield, Gilbert, English clergyman and controversialist: b. Nottingham 22 Feb. 1750; d. London 9 Sept. 1801. He was educated at Cambridge, took orders, but renounced the Anglican communion after holding two curacies, was classical tutor in nonconformist academies at Warrington (1779-83), and Hackney (1790-1). He was imprisoned two years in Dorchester jail for a so-called seditious libel in answer to Bishop Watson, for which his political friends consoled him with a gift of £5,000. He published editions of Bion and Moschus, Vergil, Horace, and Lucretius; 'Christian Writers of the First Three Centuries on the Person of Christ' (1784), left unfinished; 'Inquiry into the Expediency and Propriety of Social Worship' (1791), the necessity for which he denied; 'An Examination of Paine's Age of Reason' (1794); 'Silvia Critica,' a collection intended to illustrate the Scriptures from the stores of profane learning (1789-95). He was a man of wide learning, but although very amiable in ordinary life extremely bitter as a controversialist. After leaving the Church of England he never attached himself to any other religious society, although practically a Unitarian. Consult his autobiography, entitled 'Memoirs' (1792).

Wakefield, England, an episcopal city, in Yorkshire (West Riding), on the river Calder, nine miles south by east of Leeds. The cathedral of All Saints, founded 1329, is mainly in the Perpendicular style, with a lofty tower and spire, though including work of earlier and later dates. Saint Mary's Chantry, on the ancient bridge across the river, is a decorated structure of the time of Edward III., restored in 1847. Besides several other places of worship, the chief buildings and institutions of the town include: the town-hall, a fine building in French Renaissance style; a large corn-exchange; a market-house and an industrial and fine art institution (1890), containing a museum, laboratory, and lecture-room. The industrial establishments comprise woolen-mills, soap and artificial-manure works, iron-foundries, boiler-works, agricultural implement manufactories, wire-rope works, machine-works, corn-mills, malting-works, breweries, etc. There are many collieries near the town, and market-gardening is carried on in the vicinity. The trade, especially in corn, is very extensive, and is facilitated by railway connections as well as by the river Calder and canals. Wakefield is mentioned in 'Domesday Book.' It was the scene of a Yorkist defeat in the Wars of the Roses on 31 Dec. 1460. In 1888 it was made the seat of a bishopric, formed mostly out of the diocese of Ripon.

Wakefield, Mass., town in Middlesex County; on the Boston & Maine Railroad; about nine miles north of Boston. It is surrounded by farms, and it has several manufactories, chief of which are iron and brass foundries, piano factory, rattan goods works, shoe factory, flour mill, and machine-shops. In 1909 (government census) Wakefield had 23 manufacturing establishments, capitalized for \$3,846,000. The raw material used each year cost \$2,835,000, and the value of the annual products was \$2,692,000. The town contains the villages of Greenwood, Montrose, and Wakefield, in each of which are graded schools. There is one high school and

a public library containing about 15,000 volumes. There are two banks: the national bank has a capital of \$100,000 and \$444,270 in deposits; the savings bank has deposits amounting to over \$1,050,000. Pop. (1910) 11,404.

Wakefield, R. I., village in Washington County; at the head of Point Judith Inlet, an arm of the Atlantic Ocean, and on the Narragansett Pier Railroad; about 30 miles south by west of Providence. It is in a part of the State devoted to farming and market-gardening. The village has cotton and woolen mills, and several small industries. It has a savings bank and a trust company. Pop. (1890) 2,200. In 1910 the population was included with that of South Kingston town, which had a total of 5,176.

Wake'man, Henry Otley, English historian: b. near Worcester 25 Sept. 1852; d. Basel, Switzerland, 27 April 1899. He was educated at Christ Church, Oxford, was a fellow of All Souls from 1877 to his death, and was admitted a barrister of the Inner Temple in 1877. His publications are: 'The History of Religion in England' (1885); 'What Has Christianity Done for England?' (1886); 'The Church, and the Puritans, 1570-1660' (1887); 'Europe, 1598-1715' (1894); 'Introduction to the History of the Church of England from the Earliest Time to the Present Day' (1896; 5th ed. 1898); and an edition (with Hassall) of a volume of 'Essays Introductory to the Study of English Constitutional History' (1887).

Wakeman, Thaddeus Burr, American philosopher: b. Greenfield Hill, Conn., 23 Dec. 1834. He was graduated from Princeton in 1854, and was admitted to the bar in 1856. He has translated Goethe's religious poems, and has made a specialty of the study of positive philosophy. He is president of the Liberal University of Kansas City, and has published: 'An Epitome of Positive Philosophy'; 'Liberty and Purity' (1881); 'Evolution or Creation'; etc.

Wake'manites, certain fanatics who were supposed to be harmless until they committed a murder at New Haven, Conn., in 1855. Their leader was an old woman named Rhoda Wakeman, supposed to have been insane. Her followers obeyed her as a prophetess and believed she had been raised from the dead. At her bidding they murdered a farmer, Justus Matthews, who, she said, was possessed by an evil spirit. The unfortunate man willingly submitted to the sentence pronounced by the old woman, but the authorities prevented further tragedies by taking prompt action against all concerned in the crime, and the sect became extinct.

Walam Olum, otherwise known as the "Red Score" of the Lenni Lenape or Delaware Indians, and supposed to be a record of the migrations of the tribe. The word "Olum" signifies a record, and "Walam," painted. Red is the color used. "Olum" was commonly applied to a notched stick, an engraved piece of wood or bark; but it is not unlikely that the engraved stone gorgets, notched along all their edges, or partly so, are to be included as records. The notching is too inconspicuous to be considered as ornamentation, but is so cleanly cut and defined that some serious purpose was evidently in mind in making it. The historic

"Walam Olum," for which we are indebted to Rafinesque, is declared by Antony, a Delaware Indian, to be a genuine composition of a member of that tribe. This composition, or record of events during the wanderings of the people, is asserted by Brinton to be "not of foreign origin, but wholly within the cycle of the most ancient legends of that stock"—the Algonquin. If read aright, it is a record of wanderings from the Labrador region southward and westward, and again eastward to the Atlantic coast of the middle United States. As a record of a migration that was possibly more extensive and fateful to these people than any one other of which they had knowledge, too much value has been placed upon it. Those ethnologists who have strongly leaned to the extreme modernity of man in America have thought they found evidence therein that the whole Atlantic seaboard, and for many leagues inland, was uninhabited and had so remained for all time until this wandering, described in the Walam Olum, took place. This conclusion does not seem to be supported by the results of geological research. Entirely too much has been made also of the assumption that the migration of the Lenni Lenape, supposedly described in the "Walam Olum," was their only one.

Walcheren, vâl'xér'ën, Netherlands, an island in the province of Zeeland, at the mouth of the Scheldt, forming an irregularly-shaped circle about 11 miles in diameter. It is well wooded and has fertile meadow lands, yielding corn and other crops in great plenty. Fruit is abundant. It contains the towns of Flushing, Middleburg (the capital), and Veere. It is protected from the sea by strong dikes. The island is noted for the Walcheren expedition of 1809, one of the most complete failures in British military history. The second Earl of Chatham, eldest son of the great Chatham, was despatched to the island in command of a force of about 40,000 for the purpose of capturing Antwerp and destroying Napoleon's arsenals on the Scheldt. Instead, however, of pressing forward against Antwerp, he persisted in the siege of Flushing, which was not captured before the greater port had been reinforced and strongly fortified by the French. Chatham returned to England with the bulk of his force, leaving a garrison of 15,000 on the island of Walcheren. The garrison was attacked by marsh fever and other diseases, about one half dying, and over half of the remainder being permanently disabled. Orders were then received from the government to destroy Flushing and return home.

Walckenaër, vâl-ké-nâr', Charles Athanasé, BARON, French savant and author: b. Paris 25 Dec. 1771; d. there 27 April 1852. At 17 he went to study at Glasgow and Oxford; served as director of transportation in the army of the Pyrénées in 1793; became mayor of Paris in 1816, and prefect of the department of Nièvre in 1824 and of Aisne in 1826. In 1830 he finally left the public service, and in 1840 he became perpetual secretary to the Academy of Inscriptions. He was a voluminous writer on very many subjects. His first publication was an 'Essai sur l'histoire de l'espèce humaine' (1798), and in 1802 he published an 'Histoire abrégée des insectes des environs de Paris' and in 1805 a 'Tableau des aranéides,' an important

contribution to entomology. Among his remaining works may be cited: 'Le monde maritime' (1819); 'Nouvelle collection des relations des voyages' (21 vols., 1826-31); 'Analyse géographique des itinéraires des anciens' (1839); 'Histoire de la vie et des poésies d'Horace' (1840); 'Mémoires sur Madame de Sévigné' (1842-52), which he left incomplete.

Walcott, wôl'kôt, Charles Doolittle, American geologist: b. New York Mills, N. Y., 31 March 1850. He made a special study of geology, and in 1876 became assistant State geologist of New York. He was appointed to a like office in the United States geological survey in 1879, became paleontologist in 1883, chief paleontologist in 1891 and in 1893 was appointed geologist in charge of geology and paleontology, and director of the geological survey in 1894. He was acting assistant secretary of the Smithsonian Institution in 1897-8, on 23 Jan. 1907 he was elected secretary, and in 1902 was elected chairman of the board of trustees for the National University founded by Andrew Carnegie. He has made a specialty of Cambrian researches and in 1888 laid the results of his labors before the International Geological Congress in London. His writings include: 'The Trilobite' (1881); 'The Cambrian Faunas of North America' (1885); 'The Taconic System of Emmons' (1888); 'The Fauna of the Lower Cambrian or Olenellus Zone' (1890); 'Correlation Papers, Cambrian' (1891); etc.

Waldeck, vâl'dêk or wôl'dêk, Germany, a principality consisting of two distinct portions, Waldeck proper and Pyrmont. Waldeck proper, with an area of 407 square miles, is enclosed by the Prussian provinces of Westphalia and Hesse-Nassau; and Pyrmont, with an area of 25 square miles, is enclosed by Prussia, Brunswick, and Lippe. Both sections are mountainous, and belong to the basin of the river Weser. Waldeck proper is nowhere much under 600 feet above sea-level, and in the western region, known as Upland, it attains in the Ettelsberg an elevation of 2,726 feet. Much of the soil is unsuited for agriculture, but some parts, such as the lower valley of the Eder and the northeast of Waldeck proper, are fairly fertile. The chief industries are agriculture and the rearing of cattle, sheep, pigs, and other animals. Manufactures are of small extent: the most important are tobacco and cigars (Pyrmont), liqueurs (Arolsen), and machines (Wetterburg). There are ironstone mines at Adorf. The constitution bears date 17 Aug. 1852. The princely dignity is hereditary according to primogeniture in the male line, but on the extinction of the male line is falls to the female line. The Diet consists of 15 members elected indirectly for three years. By the Treaty of Accession of 1867, renewed in 1877 and 1887, the internal administration is carried on by a Landesdirektor appointed by the Prussian government with the approval of the prince. Its courts of justice are subject to those of Cassel and Hanover, and its troops form a battalion of a Prussian infantry regiment. Arolsen is the capital and residential town. The Reformation was introduced under Count Philip IV. in 1526. The imperial field-marshal, George Frederick (1664-92), was the first of its rulers to assume the style of prince. In 1712 the ruler Anton Ulrich was created a prince of the empire. Waldeck supported Prussia

in the war of 1866, and entered the North German Confederation in the following year. The Treaty of Accession of 1867, which makes the prince a merely nominal sovereign, was the result of a desire expressed by the Diet for union with Prussia. Pop. about 40,000, of whom 9,000 are in Pyrmont. The inhabitants are nearly all Lutherans.

Waldeck-Rousseau, vâl-dêk-roo-sô, Pierre Marie, French statesman: b. Nantes 2 Dec. 1846; d. Paris 10 Aug. 1904. He studied law, was admitted to the bar at Nantes, was elected deputy for Rennes in 1879, and in 1881 was made minister of the interior in Gambetta's cabinet. This portfolio he held also with great success in the Ferry ministry of 1883-5, in 1886 was called to the Paris bar, and, though he continued to participate until 1889 in the debates of the Chamber of Deputies and in that year published a collection of 'Discours Parlementaires,' he then withdrew temporarily from public life and became one of the foremost of French advocates. His best known case was the defense of De Lesseps (q. v.) in the Panama canal matter. In 1894 he returned to politics as senator for the department of the Loire, in 1895 was an unsuccessful candidate for the presidency, and in 1899 was summoned by Loubet to form a ministry. On the second attempt he succeeded in assembling in support of the Republic a cabinet including such diverse elements as Millerand, the Socialist, and General de Gallifet, who had so severely put down the Commune in 1871. He himself took again the ministry of the interior, and during the second Dreyfus trial, the strikes at Le Creusot, the prosecution and condemnation of Déroulède, and other troubles, he suppressed the disorder hitherto prevalent and enforced a regard for the law. The Associations bill of 1901, by which he asserted the religious associations were for the first time made subject to the rules governing others, was the principal event of the latter part of his administration. At the general election of 1902, Republican victory was complete, and Waldeck-Rousseau, regarding his service as accomplished, resigned 3 June 1902. He had proved himself one of the strongest figures in recent French politics. He further published: 'Discours Prononcés dans la Loire' (1896); 'Questions Sociales' (1900); 'Associations et Congrégations' (1901); 'La Défense Républicaine' (1902). Consult Ernest-Charles, 'Waldeck-Rousseau' (1902).

Waldemar I., vâl'dê-mâr or wôl'dê-mâr (THE GREAT), king of Denmark: b. 1131; d. 1181. He succeeded Eric V. in 1147, was famous for his expeditions against the pirates of the Baltic, and successful in exacting from Magnus VI., king of Norway, a treaty which secured the pre-eminence of Denmark. **WALDEMAR II.** (the Victorious), younger son of the preceding, succeeded his brother Canute VI., in 1202. He made warlike expeditions into Sweden, Norway, and Germany, raised a powerful navy, and revised the laws of his kingdom. He died in 1241. **WALDEMAR III.**, eldest son of the preceding, was regent from 1219 to 1231. **WALDEMAR IV.**, third son of Christopher II., was in Bavaria at the death of his father in 1333. In 1340-4 he recovered part of his kingdom in war, and obtained some further successes against Sweden in 1353 and 1357; eventually, however, he was glad to obtain peace by large concessions.

Walden, wál'dén, John Morgan, American Methodist bishop: b. Lebanon, Ohio, 11 Feb. 1831. He was graduated from Farmer's (now Belmont) College, near Cincinnati, in 1852, and afterward engaged in teaching and in journalism. He was a member of the Topeka legislature in 1857 and a delegate to the Leavenworth constitutional convention in 1858, returning in that year to Ohio where he entered the Methodist Conference. He became minister in the Cincinnati Conference Methodist Church in 1858, was one of the publishing agents of the Methodist Book Concern in 1868-84, and in the last named year was elected bishop. He has traveled in every State in the Union and through Europe and Asia in making his episcopal visits.

Walden, Treadwell, American Episcopal clergyman: b. Walden, N. Y., 25 April 1830. He was graduated from the General Theological Seminary in 1853, took priest's orders in the Episcopal Church in 1856 and after holding charges in Newark, N. J., was rector of Christ Church, Norwich, Conn., 1857-63; Saint Clements, Philadelphia, Pa., 1863-8; Saint Paul's Cathedral, Indianapolis, 1869-72; Saint Paul's, Boston, 1873-6, and Saint Paul's, Minneapolis, 1882-5. He published: 'Lays of a Lifetime' (1856); 'The Sunday School Prayer Book' (1860); 'Privations and Sufferings of United States Officers and Soldiers in Confederate Prisons' (1864); 'Our English Bible and its Ancestors' (1870); 'An Undeveloped Chapter in the Life of Christ' (1882); 'The Great Meaning of Metanoia' (1896).

Walden, N. Y., village in Orange County; on the Walkill River, and on the New York Central & Hudson River railroad (Walkill Valley branch); 75 miles north by west of New York, and 13 miles northwest of Newburgh. The date of the first settlement is uncertain, but it was before 1768; the village was incorporated in 1855. It was first known as High Falls, owing to the fall of 40 feet in the river at this point. It is in an agricultural region, noted for its dairy products and in a valley famous for its picturesque scenery. It has large cutlery works, woolen mills, a soap factory, engine works, foundries, and machine shops. There are two banks, one of which is a national bank. Pop. (1910) 4,004.

Walden University, an institution for the education of the colored race, located at Nashville, Tenn. It grew out of a school for adults and children established by the Freedmen's Aid Society; in 1866 it was chartered as Central Tennessee College. It is under the control of the Methodist Episcopal Church. In 1900 the name was changed to Walden University in honor of Bishop John M. Walden. The university includes the following departments: (1) Collegiate department; (2) academic department (preparatory); (3) normal department; (4) commercial department; (5) law department; (6) Braden Bible Training School; (7) music department; (8) Meharry Medical College; (9) industrial department. The collegiate department offers two four years' courses, the classical and the scientific; and two corresponding preparatory courses of three years. The normal department offers a course five years in length (instead of four years, as formerly); the first three years are the same in rank as the college

preparatory course; the completion of this course entitles the student to the degree of bachelor of pedagogy. The academic department offers a two years' English course, and a two years' teacher's preparatory course. In all these courses the daily study of the Bible is required. The law department, which was the first law school for colored students established in the South, has a two years' course. The Braden Bible Training School offers a theological course, correspondence courses in theology, and a missionary and deaconess training course. The theological course is two years in length, with a year of post-graduate work; the missionary training course includes studies in industrial department and the medical school. The Meharry Medical College was founded in 1876; it offers a four years' medical course, which may be completed in three years by those holding an A.B. or B.S. degree; the dental college, the pharmaceutical college, and the nurses' training school are also a part of the medical department. The industrial department includes the trade schools, the school of domestic science and art, and the Walden Industrial School. The trade schools instruction and practice in carpentry, sloyd, painting, paper-hanging, calcimining, masonry and plastering, and landscape gardening for men, and in sloyd for women, the school of domestic science provides instruction in cooking, sewing, laundry work, etc., for women; the industrial school is for the industrial training of children, and serves also as a model school for normal department. When the students attain sufficient proficiency in industrial classes, work is furnished them by which they may pay a portion of their expenses. The students maintain two literary societies. The university buildings (1910) on the campus include the administration building, seven other brick buildings, and seven wooden buildings; the medical college is located in another part of the city. The library in 1910 contained 5,600 volumes; students of the law department also have access to the State Law Library. The students in 1910 numbered 801, of whom about 350 are in the medical department. Many of the graduates are teachers; and others are successful doctors and lawyers.

Waldenses, wöl-dén'séz. This mediæval sect owes its origin and name to Peter Waldo (Waldo), a rich citizen of Lyons, although some of their writers derive the appellation Waldenses from *vallée* (valley), and called them *l'oudous*, or dwellers in the valleys, whilst others have traced their origin to the earlier sects of Henricians and Cathari. About 1170 Waldo, shocked and moved to repentance for his sins by the sudden death of a friend, came to the determination to imitate the mode of life of the apostles and primitive Christians, gave his goods to the poor, and by his preaching collected numerous followers, chiefly from the class of artisans, who, from the place of their birth, were denominated *Leonists*, or the poor of Lyons; *Sabatati* or *insabatati*, on account of their wooden shoes or sandals (*sabots*); *Humiliatists*, on account of their profession of humility, and were often confounded with the Cathari, Patarènes, Albigenses, and others, whose fate they shared. Their chief strongholds were, and still are, in the mountain tract of the Cottian Alps, southwest of Turin. In their fanatical contempt of the clergy and their opposition to the Roman priest-

hood the Waldenses resembled other sects of like character in the Middle Ages; but, going beyond the design of their founder, which was merely to preach penance and a life of poverty, they made the Bible alone the rule of their faith, and rejecting whatever was not founded on it as not conformable to apostolical antiquity, they renounced entirely the doctrines, usages, and traditions of the Roman Catholic Church, and formed a separate religious society. They were therefore excommunicated as heretics at the Council of Verona in 1184, but they did not suffer a general persecution until the war against the Albigenses, whom they closely resembled in the extravagances of their doctrines and customs, after they had spread and established themselves in the south of France, under the protection of the counts of Toulouse and Foix. At that time (1209-30) many Waldenses fled to Aragon, Savoy, and Piedmont. In Languedoc they were able to maintain themselves till 1330; in Provence, under severe persecution, till 1545, when the parliament at Aix caused them to be driven out of the country, still longer in Dauphiny; and not until the war of the Cevennes were the last Waldenses expelled from France. In the middle of the 14th century single congregations of this sect went to Calabria and Apulia, where they were soon suppressed; others to Bohemia, where they were called Grubenheimer, because they used to conceal themselves in caverns. They soon became amalgamated with the Hussites; and from them the Bohemian brethren derive the apostolical consecration of their bishops. Their doctrines rest solely on the Bible, which, with some catechisms, they have in their old dialect, consisting of a mixture of French and Italian. In this language their worship was performed till their old *Barbes* (uncles, teachers) became extinct in 1603. They then received preachers from France, and since that time their preaching has been in French. These teachers, however, form no distinct priesthood, and are supplied from the academies of the Calvinistic churches. Their rites are limited to baptism and the Lord's supper, respecting which they adopt the views of Calvin. The constitution of their congregations which are chiefly employed in the cultivation of vineyards and in the breeding of cattle, and which are connected by yearly synods, is republican. Each congregation is superintended by a consistory composed of elders and deacons, under the presidency of the pastor, which maintains the strictest moral discipline, and adjusts small differences. After they had entered into a religious communion with the Calvinists, in the 16th century, they were also exposed to the storm which was intended to sweep away Protestantism, and this was the cause of their extirpation in France and their checkered fate in Piedmont. Those who had settled in the marquisate of Saluzzo were totally suppressed by 1633; and those in the other valleys, under the jurisdiction of the court of Turin, were subjected to severe persecution, often occasioned by their own aggressiveness. Aided by the mediation of the Protestant powers, they finally procured a new, though more limited, ratification of freedom by the treaty concluded at Pinerolo 18 Aug. 1655. The persecution exercised in 1685 through French influence obliged thousands to emigrate into Protestant countries, including the English col-

onies in North America. In London they united with the French Huguenots; in the Netherlands with the Walloons; in Berlin with the French congregations; and nearly 2,000 went to Switzerland. Some of these returned by force to Piedmont in 1680, and with those who had remained maintained themselves under many restrictions, to which an end was finally put in 1725 in consequence of Prussian mediation.

The Waldenses were not permitted to enjoy full religious freedom and civil rights until the establishment of the kingdom of Italy, but now they do so not merely in their old valleys of Lucerne, Perusa, and Saint Martin, but generally throughout Italy, and they have churches in Turin, Rome, Venice, and elsewhere. Their church service is under the direction of a synod. After long negotiations, in the way of which great difficulties were thrown by the opposition of the Tübingen theologians, several hundreds of the above-mentioned fugitives settled in Württemberg in 1699, where their descendants now form several parishes. They are next to the Calvinists in the simplicity of their worship and in their ecclesiastical constitution, but in intellectual cultivation are behind the other Protestants. (See REFORMATION, RELIGIOUS SECTS.) Consult: Léger, 'Histoire générale des églises évangéliques des vallées de Piémont ou Vaudoises' (1699); Dieckhoff, 'Die Waldenser im Mittelalter' (1851); Herzog, 'Die romanischen Waldenser' (1853); Melia, 'Origin, Persecution, and Doctrines of the Waldenses' (1870); Montet, 'Histoire littéraire des Vaudois du Piémont' (1885); Preger, 'Die Verfassung der französischen Waldenser in der älteren Zeit' (1890); Bompiani, 'Short History of the Italian Waldenses' (1897); Schaaff, 'Creds of Christendom' (1877-8).

Waldersee, vâl'dér-zé, Albert, Count von, German soldier: b. Potsdam, Prussia, 8 April 1832; d. Hanover 5 March 1904. He entered the Prussian artillery of the guard in 1850, and in 1866 was assigned to the general staff and promoted major. During the Bohemian campaign he was connected with the general headquarters, after the peace became a member of the staff of the 10th army corps, and in 1871, at the outbreak of the Franco-Prussian war, was made chief-of-staff to the Grand Duke of Mecklenburg-Schwern, commander of one of the divisions. Promoted colonel and commander of the 13th Uhlans, his subsequent advancement was rapid. In 1880 he became a general, in 1882 lieutenant-general, in 1888 general of cavalry. Upon von Moltke's resignation as chief of the general staff (1888), Waldersee was chosen as successor; and it was very generally believed that he would follow Bismarck in the chancellorship, for which, however, Count von Caprivi was selected. Waldersee became commander of the 9th army corps in 1891, in 1898 inspector-general, in 1900 field-marshal of the empire. At the time of the Boxer outbreak in China (see BOXERS) he was placed in command of the German forces in that country, and from 27 Sept. 1900 to 4 June 1901, by approval of the powers, commanded the allied armies there. His activities in China contributed largely to a speedy adjustment of difficulties, while he was at the same time successful in preserving harmony among the allies.

Waldis, Burkard, vâl'dis, German rhyming fabulist. b. about 1490; d. about 1557. He was a Franciscan friar, but on returning from a pilgrimage to Rome, embraced the doctrines of Luther. He wrote a charming drama in Low German, 'The Parable of the Prodigal Son'; translated the 'Psalter' into German verse; and wrote 'Æsopus,' a collection of about 400 rhymed fables and drolleries.

Waldmüller, Ferdinand, Austrian painter: b. Vienna 1793; d. 1865. He was very successful as a painter of peasant life, and also drew much of his inspiration from the life of childhood. Among his principal works are: 'Two Tyrolean Huntsmen Resting' (1829); 'Beggar Boy on the Bridge' (1830); 'Soup Day at the Convent' (1858); 'After School' (1841); 'Sunday Afternoon' (1846); 'Palm Sunday' (1855); and 'Evening Prayer' (1864).

Waldmüller, Robert, vâld'muhl-ler, pseudonym of Charles Edouard Duboc, a German poet and miscellaneous writer: b. in Hamburg 17 Sept. 1822; d. about 1857. His best work is 'Village Idylls' (1860). Other works are 'Travel Studies' (1860); 'Sorrow and Joy,' a romance (1874); 'Brunhild,' a drama (1874).

Waldo, wôl'dô, Daniel, American Congregational clergyman: b. Windham, Conn., 10 Sept. 1762; d. Syracuse, N. Y., 30 July 1864. He was drafted as a soldier in the army in 1778, and was arrested and captured by the Tories and carried to New York, where he was confined for two months, and then exchanged. After graduation at Yale in 1788 he studied theology, and in 1792 was ordained pastor of the Congregational Church in West Suffolk, Conn. Here he continued till 1809, when he resigned his charge, having for some time acted as a missionary in the States of Pennsylvania and New York. In 1810-11 he preached at Cambridgeport, Mass., after which he served as a missionary in Rhode Island till 1820, and was settled for 12 years at Exeter, Conn.; and afterward resided in the State of New York, without any stated charge. In 1855 he was made chaplain of the House of Representatives.

Waldo, Frank, American meteorologist: b. Cincinnati, Ohio, 4 Nov. 1857. He was graduated from Marietta College, Ohio, in 1878, subsequently studied at Harvard, and in 1882-3 was in Europe on United States government service. Upon his return to the United States he became instructor in astronomy at Radcliffe College, and was later engaged in teaching meteorology at the Corcoran School of Science, Columbian University. He afterward accepted the position of junior professor in the United States Signal Service, and has since become professor. He has published: 'Modern Meteorology' (1893); 'Elementary Meteorology' (1896); etc.

Waldo, Peter, French merchant: b. in the latter half of the 12th century; the date of his death is unknown. Waldo had acquired considerable wealth, when the sudden death of a friend turned his attention to spiritual things. He had translations made of portions of the Scriptures, which he read, and became convinced that he should lead a life of poverty. He gave part of his property to his wife and part to the poor, and began to preach his doctrines in the streets of Lyons. He advocated the study of the Scriptures by the individual Christian, and the right of laymen to teach.

This brought upon him the condemnation of the Church, and the archbishop of Lyons forbade Waldo and his followers to continue their teaching. They appealed to the pope, and at the Lateran Council in 1179 they were condemned. See WALDENSES.

Waldo, Samuel Putnam, American author: b. in Connecticut in 1780; d. Hartford, Conn., March 1826. He wrote: 'Narrative of a Tour of Observation by President Monroe' (1818); 'Memoirs of Andrew Jackson' (1820); 'Life of Stephen Decatur' (1821); 'Biographical Sketches of Nicholas Biddle, Paul Jones, Edward Preble, and Alexander Murray' (1823). He edited 'Journal of the Brig Commerce upon the Western Coast of Africa.'

Waldoboro, wôl'dô-bûr-ô, Maine, town, port of entry, Lincoln County; on the Medomak River, and on the Maine Central railroad; about 26 miles southeast of Augusta, and 18 miles west of Rockland. It was settled in 1749 by a colony of Germans, and in 1773 was incorporated. It is in an agricultural section. The chief manufacturing establishments are a shoe factory, machine shop, men's clothing factory, and creameries. Formerly the town was noted for its ship-building. The principal public buildings are the United States custom-house, the churches, schools, and the bank. Pop. (1910) 2,656.

Waldseemüller, Martin, the scholar who gave America its name. He was born at Freiberg, and his name was written in the school-list for the first time at that place 7 Dec. 1490. Assuming that this matriculation occurred when he was 8 or 9 years old, we have as the year of his birth 1481 or 1482. Equally conjectural is the year of his death. In 1522, L. Fries referred to him as deceased, and it has been supposed that the event was then recent. Certain it is that Waldseemüller was canon of St. Dié when he died, and that in the same Vosgian mountain town before 1507 he was regarded as an able young geographer by the little group of learned men there assembled. His 'Cosmographie Introductio' and his map of the world (the latter prepared as a globe also: '*sem in solido quam planis*'), both published at St. Dié in the year last mentioned, produced the effect described in our first volume (see AMERICA: a brief account of the derivation and meaning of the word). The name confidently proposed for the transatlantic lands, and at the same time actually conferred upon the new '*quarta orbis pars*,' in the little Latin treatise and on the huge wall-map and globe, was so promptly and generally caught up that its originator himself was powerless to recall it. When he issued his 'Carta Marina,' in 1516, he had changed his opinion as to the relative value of the achievements of Columbus and Amerigo Vespucci, for the word America does not appear on the map of 1516. But it was, fortunately, too late to impose a name less significant and less appropriate (see article mentioned above, and contrast the meaning of 'America' there given with that of 'Columbia,' that is, 'land of the dove'). Of the Waldseemüller map of 1507, 1,000 copies were printed, yet all were destroyed or lost long ago, and, indeed, the same fate had overtaken the Carta itineraria Europæ of 1511, and the Carta Marina of 1516. The Carta itineraria was the first to be recovered; the more interesting maps of 1507 and

1516 did not come to light until 1901, when their discovery created a sensation. In 'The Geographical Journal' for February 1902 we read: "Ever since Humboldt first called attention to the 'Cosmographie Introductio' no lost maps have ever been sought for so diligently as those of Waldseemüller. It is not too much to say that the honor of being their lucky discoverer has long been considered as the highest possible prize to be obtained among students in the field of ancient cartography. But until the last few months no specimen of either the globe or map has ever been seen or heard of in modern times. A few months ago the geographical world was suddenly startled by a brief announcement that Waldseemüller's long-lost map of 1507, together with another of his of 1516, had been found by Prof. P. Joseph Fischer of Feldkirch, in the library of Prince Waldburg at Wolfegg Castle." In the excellent work by Fischer and Wieser (see below) it is written that "Johann Schöner had the two Waldseemüller maps bound in the form of an atlas. To this circumstance we owe the preservation of the two precious cartographic monuments, while those copies that were mounted as wall-maps perished—as it seems, without exception—in consequence of their enormous size." In conclusion we would invite attention to two points: (1) The assertion so commonly made, that Waldseemüller intended to bestow the name America upon the southern continent only, appears at first sight to find support in the map of 1507, but is disproved by a comparison of the map with the explanatory passages in the 'Introductio'; (2) The Greek form of his own name on the map of 1516 is *Ilacomilus*, showing plainly his preference for that spelling toward the end of a rather short life. The fact that his name does not stand in any form upon the map of 1507 is additional evidence of juvenility. He appears to have been so young that his signature might have made good work seem less authoritative then. He was perhaps 25 years old when he produced a word that was to fill a place in all languages during all later ages.

Consult. Fischer and Wieser, 'Die älteste Karte mit dem Namen America'; Humboldt, 'Kritische Untersuchungen'; d'Avezac, 'Martin Hylacomylus Waltzemüller'; Harisse, 'Bibliotheca'; 'Decouverte,' etc.

MARRION WILCOX.

Author of 'History of War with Spain'; 'War in Philippines,' etc.

Waldstein, wald'stēn, Charles, American archaeologist: b. New York 30 March 1846. Educated at Columbia and Heidelberg universities he became university lecturer in classical archaeology at Cambridge, England, 1880-2. He was appointed director of the Fitzwilliam Museum there 1883-9, a fellow of King's College, Cambridge, 1893, and has been Slade professor of fine arts at same college since 1895. As director of the American School of Classical Studies at Athens (1889-95) and professor (1895-7), he directed excavations with signal success at Platæa, Eretria, etc. He has written: 'Excavations at the Heraion of Aegæa'; 'Balance of Emotions and Intellect' (1878); 'Essays on the Art of Phidias' (1885); 'The Work of John Ruskin' (1894); 'The Study of Art in Universities' (1895); 'The Surface of Things' (1899); 'The Jewish Question' (1899); 'The Expansion of Western Ideals and the World's Peace' (1899); 'The Argive Heraeum' (1902).

Wales wālz, Prince of, title given to the eldest son of the English sovereign since the time of Edward I. In 1902 the Prince of Wales was George Frederick Ernest Albert: b. Marlborough House 3 June 1865. He entered the navy 5 June 1877, spent two years on the training ship Britannia, and then accompanied by his brother, the late Duke of Clarence, started on a three years' voyage around the world on board the *Bacchante*. In 1883 he was made a midshipman on the *Canada*, stationed off the North American coast, and in 1885 was promoted lieutenant. He was made commander in 1890 and opened the Jamaica Industrial Exhibition. In 1891 he visited Ireland with the Duke of Clarence, and, on the latter's death in 1892, became heir to the throne and took his seat in the House of Lords as Duke of York. He was married to the Princess Victoria Mary of Teck, at Saint James' Palace, 6 July 1893, the ceremony being attended by the King and Queen of Denmark, the Czarewitch, and other royal and imperial guests. In 1901 he was appointed rear-admiral, and colonel-in-chief of the Royal Marine Forces. On 22 Jan. 1901, by the death of Queen Victoria, he succeeded his father as Duke of Cornwall, and with the duchess made a tour of the colonies, opening the first Parliament of the Commonwealth of Australia, and returning in November.

Wales, Great Britain, a former Celtic kingdom, in the central western peninsula, now an administrative division of England, and a principality, which gives the title of Prince of Wales to the heir-apparent of the British crown. It has an area of 7,466 square miles, divided into 12 counties. For the names, areas, and populations of the counties see the article ENGLAND; and for statistical matter see GREAT BRITAIN.

Wales is composed of a peninsula, with the island of Anglesey at its northwest extremity, joined at the Menai Strait by two remarkable bridges; a number of smaller islands lie chiefly at a short distance from the southwest coast. The peninsula, washed north and west by the Irish Sea, and south by Bristol Channel, and bounded west by the four English counties, Cheshire, Shropshire, Hereford, and Monmouth, is 135 miles long; where widest 95 miles, and where narrowest only 35 miles broad. It is very mountainous, particularly in the north division, where Snowdon, the culminating point of South Britain, rises to the height of 3,571 feet; is intersected by beautiful valleys, traversed by numerous streams, including among others the Severn, which has its source within it; and is rich in minerals, particularly copper in the north, and coal and iron partially there also, but much more extensively in the south. The Silurian formation, so called after the Silures, the ancient inhabitants of the principality, covers more than two thirds of the whole surface, extending continuously from the mouth of the Conway to the vicinity of Saint David's Head; but is succeeded in the south by the Old Red Sandstone, above which lies the mountain-limestone and the large and valuable coal-field. Besides the Severn, the principal rivers are the Dee, which has part of its lower course in Cheshire; the Clwyd, in Denbigh and Flint; the Conway, forming the boundary between Denbigh and Carnarvon; the Dovey, and the united Rheidol and Ystwith, which have their mouths near the centre of Cardigan Bay; the Teify, separating Cardigan on the north from Carmarthen and

Pembroke on the south; the Cleddy and Cledwen, remarkable chiefly from contributing, by their junction, to form the splendid estuary of Milford Haven, the Towy and Bury, which both fall into Carmarthen Bay; the Ebwy and Taf, which have a common estuary in Bristol Channel, the Romney, which forms part of the boundary between Wales and England, and the Usk and Wye, which, though rising in the principality, have only the earlier part of their course within it. The lakes are numerous, but the largest, that of Bala, is only four miles long and scarcely one mile broad. The climate is on the whole moderate and equable, though somewhat keen in the loftier districts. In all the counties, but more especially in the maritime, humidity is in excess, the average fall of rain in the principality being 34 inches, while that in England is only 22. Both climate and surface render Wales more adapted for pasture than agriculture. The soil, too, seldom possesses great natural fertility, except in some of the vales, of which those of the Clwyd in the north, and of Glamorgan in the south, are celebrated for productiveness. The latter, rather a plain than a vale, is of great extent, and grows excellent wheat. The system of agriculture, however, notwithstanding recent improvements, continues on the whole indifferent. The minerals, as already observed, are very valuable, and the south contains some of the largest coal and iron works in the kingdom, as well as the copper works of Swansea, probably the most extensive in the world. Of manufactures, properly so called, by far the most important are woollens. The principal articles are flannel, for which the principality has long been famous, cloth chiefly of a coarser description, and hosiery. The inhabitants are almost purely Celtic in race, being the descendants of the early Britons, who were able to maintain themselves here when the rest of the country was overrun by the Germanic invaders. One of the most striking native features is the female dress, consisting generally of a plain or checked gown, a mantle, a napkin of gay colors around the neck and shoulders, and a black beaver hat, broad-brimmed and tapering to the form of a truncated cone. All classes are distinguished by civility and hospitality. Many curious superstitions, handed down by immemorial custom, still retain their hold. The Welsh cherish their Brythonic or Cymric language with great affection. They have transplanted it to America, where it prevails in some districts, and is represented by newspapers. In 1891 there were in Wales 508,000 people who knew no English, or at least habitually spoke Welsh. Most of the upper class belong to the Established Church, but the majority are Nonconformists, the most numerous bodies being the Congregationalists, the Calvinistic Methodists, and the Baptists. See CELTS; CYMRI, CELTIC LANGUAGES, GREAT BRITAIN. WALES; COMMERCE; INDUSTRIES; AGRICULTURE; MINING; ETC.

History—Previous to the Roman occupation Wales appears to have been chiefly inhabited by three British tribes, called the Silures, Demetæ, and Ordovices. During the later period of the Roman occupation, perhaps from the reign of Diocletian, the subject part of the island was divided into four provinces, of which one, including the country from the Dee to the Severn, was called Britannia Secunda. It was after the invasion of the Saxons that the country

acquired a distinctive national character, as the refuge of the vanquished Britons who were gradually driven to the west, and many of whom migrated to Brittany (q.v.), France, whence the name, and similarity of the Breton language to the Welsh. From this period till the final conquest of the country by Edward I. there is little but a succession of petty wars between the rival chiefs or kungs into which both countries during a great part of the Saxon period were divided, or the more systematic efforts of the larger monarchy to absorb the smaller. Among the greatest of the Welsh heroes of the early period was Cadwallon. After being defeated by Edwin of Deira, or Northumbria, and compelled to flee to Ireland, he returned and defeated the Saxons in numerous battles, but was at last defeated and slain by Oswald of Northumbria in 635. While the border territories continued to be contested in incessant warfare between the two races, Offa of Mercia built the celebrated dyke (see OFFA'S DYKE) known by his name to guard the marches which he had conquered. In the middle of the 9th century Roderick, or Rhodi Mawr, succeeded in uniting the whole of Wales into one principality, but he divided it among his sons into three principalities, called respectively Gwynedd (or North Wales), Ceredigion and Dyfed (or South Wales), and Powys (composed of parts of the counties of Montgomery, Salop, and Radnor). Soon after this the Danes began to invade Wales. The country was again re-united in the 10th century under Howel, surnamed Da, the Good; but as the English monarchy also acquired unity it gradually prevailed over the smaller principality, and Athelstane received tribute as the sovereign of Wales, although his sway in the country was only nominal. The claim of the conqueror being resisted, William invaded the country and compelled the Welsh princes to do homage, but they continued in virtual independence, and became troublesome to the succeeding Norman monarchs by allying themselves with their disaffected subjects. William and his successors tried to break their spirit by granting fiefs in Wales to Normans and English on condition of conquest, and Henry I. introduced into the country a colony of Flemings. Henry I., Henry II., John, and Henry III., all made with various success a series of efforts to reduce the Welsh princes to submission. Llewellyn and David, princes of North Wales, successively did homage for that dominion to Henry III. On the death of David, Llewellyn revolted against Edward I., but was defeated by Henry, and in a subsequent revolt was again defeated and slain by the Earl of Mortimer, 1284. His brother David, who followed his example, was taken and executed. Edward I. created his eldest son Prince of Wales, and from this time Wales was united with England.

Consult: Arnold, 'Studies of Celtic Literature' (1867); Borrow, 'Wild Wales: its People, Language, and Scenery' (1901); Bund, 'The Celtic Church of Wales' (1901); Edwards, 'Wales' (1901); Rhys and Jones, 'The Welsh People' (1900); Stephens, 'Literature of the Kymry' (1876); Watt, 'Sketch of Welsh Literature' (1863).

Wales, University of (in Welsh, *Prifysgol Cymru*), a British institution established by charter in 1893, and formed by the union of association of three existing colleges, the Uni-

versity College of Wales, Aberystwith, founded in 1872; the University College of North Wales, Bangor, founded in 1884; and the University College of South Wales and Monmouthshire, Cardiff, founded in 1883. Each of the colleges has a women's hall of residence, that of the last being known as Aberdare Hall. There are no special university buildings apart from those of the colleges, but there are temporary offices at Newport, Monmouth. The university has power to grant degrees in arts or literature, science, law, theology, and music; but the constituent colleges do not supply a full course of instruction in each of these subjects, the necessary courses for the degrees of B.A. and B.Sc. being at present those chiefly provided. As regards theology, instruction is furnished by a number of theological colleges in the principality, at which students may qualify for the degree of B.D. The classes are open to persons of either sex above the age of 16 years. The first matriculation examination of the university was held in 1895.

Walfish, wôl'fish, or **Walviesch Bay**, West Africa, a harbor and small territory belonging to Great Britain since 1878, on the coast of German Southwest Africa, close to the parallel of 23° south. The harbor, frequented by whale fishers, is a good one, and is formed by a sandy spit of land which projects northward parallel with the coast, and ends in a point known as Pelican Point. It receives the river Khuisab at its head, and just beyond the northern frontier of the territory is the mouth of the river Swakop, where the German authorities have constructed a new harbor, known as Swakopmund. The enclave is included in Cape Colony for administrative purposes. The area is 430 square miles, and the population 768, of whom only 31 are white.

Walford, wâl'fôrd, Lucy Bethia Colquhoun, English novelist: b. Portobello, Scotland, 17 April 1845. She was married to A. S. Walford of Cranbrooke Hall, Essex, in 1869. Her first novel, 'Mr. Smith,' appeared in 1874, and in certain respects it has not been surpassed by any of her later works, although she has gained in ease of dialogue and description. A sound ethical purpose underlies all her many novels, among the best of which are 'Cousins' (1879); 'Troublesome Daughters' (1880); 'The Baby's Grandmother' (1885); 'The Archdeacon' (1899); 'Sir Patrick, the Puddock' (1900).

Walhalla, vâl'hâl'lâ, **Valhal**, or **Valhalla**, the great hall of the Scandinavian gods, the warriors' heaven of the Vikings. Here the heroes slain in battle feasted with Odin, drinking mead from the udder of the goat, Heidrun, and eating the flesh of the boar, Sæhrimnir, which was cooked every day, and became whole again after each daily banquet. The hall was lighted by gleaming swords, roofed with shields, and the seats covered with coats of mail. Apart from feasting, fighting their battles over again was the favorite pastime of the heroes admitted to Walhalla. See SCANDINAVIAN MYTHOLOGY.

Walke, wâk, Henry, American naval officer: b. near Portsmouth, Va., 24 Dec. 1808; d. Brooklyn, N. Y., 8 March 1896. He was appointed midshipman in the navy in 1827, was promoted lieutenant in 1839, and in the Mexican

War was executive officer on the *Vestruis*, engaged at the capture of Vera Cruz. He was promoted commander in 1855 and in 1861 was assigned to duty with the Mississippi flotilla, receiving rank as captain in 1862. He commanded the squad of gunboats which assisted Grant at Belmont; was engaged at the battles of Forts Henry and Donelson, Island No. 10, and Fort Pillow; successfully passed the Vicksburg batteries; and in 1863 was transferred to the command of the *Sacramento* and sent in pursuit of the *Alabama*. He was promoted commodore in 1866, rear-admiral in 1870, and in 1871 was at his own request placed on the retired list.

Walker, wâ'ker, Amasa, American political economist: b. Woodstock, Conn., 4 May 1799; d. North Brookfield, Mass., 29 Oct. 1875. A prominent merchant of Boston from 1825 to 1840, he was known also as an abolitionist in 1843, and 1849 visited London and Paris respectively to attend the international peace conventions of those years, and in 1848 took a leading part in the formation of the Free-Soil party. In 1848 he was a representative in the State legislature, in 1849 State senator, in 1851-2 secretary of State, having been elected by the united Free-Soil and Democratic vote. He was a member of the House of Representatives in 1862-3, to complete the unexpired term of Goldsmith F. Bailey. From 1842 to 1849 he was professor of political economy in Oberlin College; and he published: 'The Nature and Uses of Money and Mixed Currency' (1857), and 'The Science of Wealth: A Manual of Political Economy' (1866; 7th ed. 1874).

Walker, Am., American naval officer: b. Portsmouth, N. H., 13 Nov. 1845. He was graduated from the United States Naval Academy in 1866, received promotion to lieutenant in 1870, and to commander in 1894. He was on duty at the Naval Academy in 1873-6, 1879-83, 1886-90, and in 1893-7. In the last named year he was placed in command of the *Concord*, and in 1898 was engaged with her in the battle of Manila Bay. He received rank as captain in 1899 and was assigned to duty at the Naval War College, Newport, R. I. He was a member of the naval examining board at Washington in 1900-1 and since 1903 has been in command of the *San Francisco*.

Walker, Francis Amasa, American economist and soldier: b. Boston 2 July 1840; d. there 5 Jan. 1897. He was the son of Amasa Walker (q.v.), was graduated at Amherst in 1860, began the study of law, which he gave up to enlist in the Union army, and served through nearly the whole of the Civil War. His rank during the greater part of the War was that of lieutenant-colonel, and in 1865 he was brevetted brigadier-general of volunteers. He taught Greek and Latin at Williston Seminary, Easthampton, Mass., from 1865 to 1868, and in the latter year was connected with the staff of the *Springfield Republican*. After serving as head of the Bureau of Statistics of the Treasury Department, in 1870 he was made superintendent of the 19th census, and in 1872 became commissioner of Indian affairs. From 1873 to 1881 he was professor of political economy and history in the Sheffield Scientific School at Yale, and in 1877-9 was lecturer at Johns Hopkins University. He was the representative of the United

States at the International Monetary Conference, Paris, in 1878. In 1880 he was appointed superintendent of the 10th census. Accepting the presidency of the Massachusetts Institute of Technology in 1881, he continued in that position till his death. He was president of the American Statistical Association from 1882 to 1897, and of the American Economic Association in 1885-92. He was an earnest advocate of international bimetalism, was deeply interested in all economic questions, particularly those concerning wages and profits, upon which he wrote with effective clearness and force. His work has exerted a marked influence upon economic study. His writings include: 'The Indian Question' (1874); 'The Wages Question' (1876); 'Money' (1878); 'Money in Its Relation to Trade and Industry' (1879); 'Political Economy' (1883); 'Land and Its Rent' (1883); 'History of the Second Army Corps' (1886); 'Life of General Hancock' (1894); 'The Making of the Nation' (1895); and 'International Bimetalism' (1896). Consult 'Publications of the American Statistical Association,' Vol. V. (1896-7), for bibliography and biographical notices.

Walker, Frederick, English painter: b. London 26 May 1840; d. Saint Fillans, Perthshire, 4 June 1875. After an ordinary school education he worked for a time in an architect's office, and then pursued his art studies at the British Museum, in an Art Academy, and in the Royal Academy schools. He became an apprentice to Whymper, the wood engraver, in 1858, and soon afterward began to provide drawings for 'Good Words,' the 'Cornhill Magazine,' and other periodicals. He illustrated the 'Adventures of Philip' and the 'Denis Duval' of Thackeray. He exhibited his first oil picture, 'The Lost Path,' at the Academy in 1863. He was elected an associate of the Old Water-color Society in 1864, and in 1871 he became an associate of the Royal Academy. His principal pictures in oils were: 'Wayfarers' (1866); by some considered his best oil-painting; 'Bathers' (1867); 'Vagrants' (1868), in the National Gallery; 'The Old Gate' (1869); 'The Plough' (1870); 'At the Bar' (1871); 'The Harbour of Refuge' (1872), in the National Gallery; and 'The Right of Way' (1875). Among his more numerous works in water-color the following may be mentioned: 'Philip in Church' (1863); 'The Young Patient'; 'The Shower'; 'The Village School'; 'Jane Eyre'; 'Refreshment'; 'Spring'; 'Autumn' (1865); 'The Bouquet' (1866); 'The Gondola'; 'In a Perthshire Garden'; 'The Housewife'; 'The Rainbow'; and 'The Fishmonger's Shop.' Consult Marks, 'Life and Letters of Frederick Walker' (1896).

Walker, George, Irish Anglican clergyman: b. of English parents in County Tyrone 1618; d. Boyne 1 July 1690. He was educated at Glasgow University, took orders, and in 1674 became rector of Donaghmore, near Dungannon. In April 1689 was made joint governor of the besieged town of Londonderry after the traitorous governor, Lundy, had been allowed to escape, and did much to inspire the heroic defenders in the siege of 105 days. He received the thanks of the House of Commons, and had honorary degrees conferred upon him by Cambridge and Oxford. He fell at the battle of the Boyne, being at the time of his

death bishop-designate of Derry. His 'True Account of the Siege of Londonderry' (1689) and 'Vindication' of it are reprinted in Dwyer's 'Siege of Londonderry' (1893).

Walker, Hugh, Scottish author: b. 7 Jan. 1855. He was educated at the universities of Glasgow and Oxford, and is professor of English literature at Saint David's College, Lampeter, South Wales. He is the author of 'Three Centuries of Scottish Literature' (1893); 'Greater Victorian Poets' (1895); 'The Age of Tennyson' (1897).

Walker, James, American college president and Unitarian clergyman: b. Burlington, Mass., 16 Aug. 1794; d. Cambridge, Mass., 23 Dec. 1874. He was graduated from Harvard in 1814, studied for the ministry, and was pastor of the Unitarian Church, Charlestown, Mass., 1818-39. He was professor of moral and intellectual philosophy at Harvard 1839-53, and president of Harvard University 1853-60. From 1831 to 1839 he edited the 'Christian Examiner.' He edited the works of Dugald Stewart, and Thomas Reid, published a 'Memoir of Josiah Quincy' (1867), and delivered lectures on 'Natural Religion' and 'The Philosophy of Religion.' He was famous as a pulpit orator.

Walker, James, American artist: b. England 3 June 1819; d. Watsonville, Cal., September 1889. He emigrated to the United States and settled in New York city early in life. In 1884 he went to San Francisco to paint a picture for a private gallery. It was a French battle-piece, and his success was so complete that he became widely known as a painter of military pictures. His principal works include: 'The Battle of Lookout Mountain'; 'The Battle of Chapultepec'; and 'The Repulse of Longstreet at Gettysburg.'

Walker, John, English actor and lexicographer: b. Colney Hatch, Middlesex, 18 March 1732; d. London 1 Aug. 1807. He was for a time engaged by Garrick at Drury Lane, was a leading member of the company at Crow Street Theatre, Dublin, 1758-62, and was at Covent Garden 1762-7. In 1768 he left the stage, and, after conducting a school at Kensington for two years, became a lecturer on elocution. His published works include, among others: 'A Dictionary of the English Language, answering at once to the Purposes of Rhyming, Spelling, and Pronouncing' (1775; latest ed., 1888); 'Elements of Elocution' (1781); 'A Rhetorical Grammar' (1785); 'The Melody of Speaking Delineated' (1789); 'A Critical Pronouncing Dictionary and Expositor of the English Language' (1791), his chief work, which was long regarded as a standard for pronunciation.

Walker, John Grimes, American rear admiral: b. Hillsboro, N. H., 20 March 1835; d. York Beach, Me., 16 Sept. 1907. He was graduated from the Naval Academy in 1856, and during the Civil War was employed in the blockading service and in the Mississippi squadron, becoming lieutenant-commander in 1862; in 1866 he was promoted to the rank of commander for gallantry. He was chief of the bureau of navigation 1881-8, became commodore in 1889, and commanded the squadron of evolution 1889-93. In 1894 he was appointed to protect American interests in the

Hawaiian Islands, was commissioned rear admiral the same year, and retired in 1897. From 1899 he was president of the Isthmian Canal Commission.

Walker, Robert James, American financier and political leader: b. Northumberland, Pa., 29 July 1801; d. Washington, D. C., 11 Nov. 1869. He was graduated from the University of Pennsylvania in 1819, studied law, and was admitted to the bar in 1821. He commenced the practice of law at Pittsburg, Pa., where in 1823 he attracted attention as the first to suggest Jackson as a candidate for the Presidency. In 1826 he moved to Natchez, Miss., where he soon acquired an extensive law practice; he also became influential in political life, was active in opposing the Nullification movement in 1832-3, and in obtaining the passage of an act by the State legislature denouncing the South Carolina Nullification Act as treasonable. In 1836 he was elected to the United States Senate as a Democrat, where he introduced the first Homestead Bill, supported the policy of Van Buren in regard to the separation of the government from the banks; and persistently advocated gradual emancipation, having freed his own slaves in 1838. He also introduced the resolution recognizing the independence of Texas, and having obtained a strong influence over President Tyler, induced him to take the steps which resulted in the annexation of Texas. He was active at the Democratic national convention of 1844 in obtaining the nomination of Polk; and during the campaign of that year wrote a letter in favor of the annexation of Texas which had a widespread influence. In 1845 he was appointed secretary of the treasury, conducting the affairs of his office with marked ability; in this position he framed the tariff bill of 1846, and was instrumental in establishing the warehouse system, an independent treasury, and in organizing the Department of the Interior. At the close of his term of office in 1849, he engaged in the practice of law in Washington; in 1857 was appointed governor of the Territory of Kansas, but resigned in 1858, being unwilling to aid in forcing slavery upon the Territory. During the Civil War he warmly supported the Union, was sent abroad as financial agent for the United States in 1863, and succeeded in negotiating a loan, and in preventing the sale of an issue of Confederate bonds. After the war he devoted himself to his growing law practice, but continued to hold a position of influence in public affairs, advocating the purchase of Alaska and opposing the impeachment of President Johnson.

Walker, Sears Cook, American mathematician and astronomer: b. Wilmington, Middlesex County, Mass., 28 March 1805; d. Cincinnati, Ohio, 30 Jan. 1853. He was graduated at Harvard College in 1824, taught school near Boston for two years, and in 1827 removed to Philadelphia, where also he engaged in teaching. His parallax tables, first prepared in 1834, for the latitude of Philadelphia, reduced the time needed for computing the phases of an occultation to less than half an hour. In 1837 he was invited to prepare a plan for the organization of an observatory in connection with the Philadelphia High School, and from its equipment in 1840 until 1852 he published in the 'Proceedings of

the American Philosophical Society' and the 'American Journal of Science' frequent and copious observations and investigations which he had made. In 1841 he published a valuable memoir on the periodical meteors of August and November. In 1845 he took part in the Washington naval observatory, where on 2 Feb. 1847, four months after the detection of the planet Neptune, he made the discovery that a star observed by Lalande in May 1795 must in fact have been this planet. By subsequent alternating computations of Pierce and Walker, the former investigating the perturbations, and the latter the orbit, the theory of Neptune was at once placed on a footing comparable with that of the other large planets. In 1847 he was invited to take charge of the longitude computations of the United States coast survey, an office in which he continued until his last illness. By the joint labors of Walker and Bache the method of telegraphic longitude determinations was developed and successfully carried out as early as 1849, with greater precision than was attained in Europe ten years later. The introduction of the chronographic method of recording observations belongs to Walker and Bache. The prosecution of the telegraphic method of longitude soon led Walker to the discovery that the time required for the transmission of the galvanic signal was measurable, and the velocity by no means as high as had been supposed.

Walker, William, American adventurer: b. Nashville, Tenn., 8 May 1824; d. Trujillo, Honduras, 12 Sept. 1860. After study of law and medicine, he was a journalist in New Orleans and San Francisco, and practised law in Marysville, Cal. In 1853 he organized a filibustering expedition against Lower California and the Mexican state of Sonora. On 4 November he arrived at La Paz, made the Mexican governor a prisoner, and proclaimed a new régime to the inhabitants of Lower California. In a few weeks difficulties arose. Reinforcements did not appear, desertions greatly reduced his force, and he was obliged to retreat across the border into California and surrender himself and band to a detachment of United States regulars. He was tried (May 1854) at San Francisco, for violation of the neutrality laws, and acquitted. But Walker was soon planning new conquests. Taking advantage of insurrectionary troubles in Nicaragua, and to some extent abetted by American capitalists interested there, he landed at Realejo 11 June 1855; and, having with his followers and a few natives won some trifling battles, managed to accomplish a peace which recognized Rivas, leader of the party favored by Walker, as president, and Walker himself as generalissimo. Many Southerners joined him as recruits, and on 1 March 1856 he had, it is said, 1,200 troops. The Pierce administration proclaimed the neutrality laws, and made attempts at prosecution, but expeditions sailed with comparative freedom from San Francisco and New Orleans to Walker's aid. Finally Vijil, a priest, the diplomatic representative of what was really the Walker government, was received 14 May 1856, though the North and many conservative Southerners condemned the action. The envoy did not remain long at Washington. Rivas absconded, and in June Walker got himself elected to the presidency. In September he published a decree repealing all laws against

WALKER—WALL-CREEPER

slavery, which had not existed in Nicaragua for 32 years. Undoubtedly he believed that such a procedure would obtain for him valuable support in the slave States. But the United States government declined to recognize him or his ministers, and his arbitrary acts provoked a native insurrection. At last he was held between Lake Nicaragua and the Pacific by an allied army of native Nicaraguans and Costa Ricans, and on 1 May 1857 he gave himself up to Commander C. H. Davis of the United States sloop-of-war *Saint Mary's*, under a treaty of capitulation obtained from Costa Rica. He was taken to New Orleans, and quickly began plotting to organize a new expedition. Arrested for violation of the neutrality laws, he was released on bail, which he forfeited, going with about 200 followers, arms, and supplies to Greytown, where he arrived 25 November. In early December Commodore Paulding, United States Navy, of the *Wabash*, compelled him to surrender. Walker presented himself as a prisoner of state at Washington in January 1858, but President Pierce declined to hold him as a prisoner, on the ground of his illegal apprehension on foreign soil. A. H. Stephens wrote in 1858 that the reason for the opposition to Walker was that "if successful, he would introduce African slavery there" [Nicaragua]. Walker was received with more or less of an ovation in the Gulf States. In October 1858 he sailed again from Mobile, but was arrested at the mouth of the Mississippi, tried at New Orleans, and acquitted. In June 1860, with a small force, he went to Trujillo to stir up revolution in Honduras. His followers were reshipped to the United States, while he was condemned and shot. He published 'The War in Nicaragua' (1860), in justification of his acts. Consult: Joaquin Miller's poem 'Walker in Nicaragua'; Doubleday, 'Reminiscences' (1886); Roche, 'Story of the Filibusters' (1891).

Walker, William Sidney, English Shakespearean scholar: b. Pembroke, Wales, 4 Dec. 1795; d. 15 Oct. 1846. He was educated at Trinity College, Cambridge, becoming a fellow of his college in 1820. Unorthodox views regarding eternal punishment prevented him from taking orders, and accordingly he had to resign his fellowship in 1829. His friend Moultrie edited in 1852 a collection of his 'Poetical Remains,' and W. N. Lettsom compiled from his papers the works entitled 'Shakespeare's Versification, and its Apparent Irregularities explained by Examples from Early and Late English Writers' (1854); and 'A Critical Examination of the Text of Shakespeare, with Remarks on his Language and that of his Contemporaries, together with Notes on his Plays and Poems' (1860), which are of the utmost value to students of Shakespeare and Elizabethan literature.

Walker, Williston, American church historian: b. Portland, Maine, 1 July 1860. He was graduated from Amherst College in 1883 and from Hartford Theological Seminary in 1886. He was professor of church history at the latter institution 1889-1901, and since 1901 has held a similar post at Yale University. He has published 'The Creeds and Platforms of Congregationalism' (1893); 'A History of the Congregational Churches in the United States' (1894); 'The Reformation' (1900); 'Ten New England Leaders' (1901).

Walker's Battery, in electricity, a battery in which the electro-negative plate is gas graphite or platinized graphite. It is excited by dilute sulphuric acid. See **BATTERY**.

Walkerton, wá'kér-tŏn, Canada, capital of Bruce County, Ontario, 65 miles northwest of Guelph, on the Saugeen River, and on the Walkington, Grey & Bruce railroad. It is a thriving and growing town, with extensive water power, several mills, iron foundry, and other industrial establishments.

Walkerville, wá'kér-víl, Canada, a town of Essex County, Ontario, on the Detroit River, two miles northeast of Windsor, near the outlet of Lake Saint Clair. It has ship-building yards, a distillery, and other industrial establishments. Pop. about 2,000.

Walkill River. See **WALKILL**.

Walking Delegate, an official connected with a trade union, whose duty it is to visit the various places at which members of his craft are employed, and personally ascertain that no laws of that particular trade guild are infringed by the workmen; also, in cases where an unexpected strike has been ordered by the executive board, it devolves on him to notify men connected with the union to cease work. See **UNIONISM**.

Walking-fish. See **SERPENT-HEAD**.

Walking-leaf. See *Pilicolas* (6), under **FERNS AND FERN ALLIES**; **LEAF-INSECT**.

Walking Purchase, Tho. In 1682 William Penn (q.v.) purchased of the Delaware Indians, a tract of land in the present counties of Bucks and Northampton, Pa., bounded on the east by the Delaware River, and in the interior at a point as far as a man could walk in three days. Penn and a party of Indians started on the walk, beginning at the mouth of Neshaminy Creek. At the end of a walk of a day and a half Penn concluded that it was as much land as he wanted and a deed was given to the lands at that point—about 40 miles from the starting place. In 1737 after Penn's death the tract was increased by a party of expert walkers to a point 70 miles in the interior instead of 40 miles. See **DELAWARE INDIANS**; **PENN, WILLIAM**.

Walking Stick, or **Stick-insect**, a wingless orthopterous insect of the family *Phasmida*, so called because in its slender, elongated form and greenish-gray hue, it resembles a dry twig so closely as easily to be mistaken for one when not moving. This is doubtless of great service to these insects as a protection against birds and other enemies which easily overlook them. Some species are several inches long. They are near relatives of the mantids, and are natives of sub-tropical and the warmer temperate regions, and walk gently among the branches of trees, reposing in the sun, with their long antennae-like legs stretched out in front. They feed upon the green parts of plants, but are rarely numerous enough to do much damage. Consult Howard, 'The Insect Book' (New York 1901). See **ARALIA**.

Wall-creeper, a small bird (*Tichodroma muraria*) of the European Alps, which frequents walls and perpendicular rocks in preference to trees, on whose rough trunks its relatives, the creepers (*Certhia*) make their living. It is

WALL DECORATION—WALL PAPER

about six inches long; plumage light gray, with bright crimson on the shoulders, the larger wing coverts, and the inner webs of the secondaries, the rest of the wings black; tail black, tipped with white. Called also spider-catcher.

Wall Decoration. See MURAL DECORATION.

Wall-eyed Pike, or Glass-eye, one of the pike-perch (*Stizostedion vitreum*) of the central part of the United States, so called in reference to its large staring eyes, also absurdly called salmon or jack-salmon in some parts of the South. Its body is elongate, back arched, head subconic, long; cheeks, gill-covers and top of head more scaly; dorsal spines high; dark olive, mottled with brassy; sides of head vermiculated; first dorsal fin with a large black patch on the hinder margin. Length one to three feet. It reaches its greatest development and abundance in the Great Lakes region and upper Mississippi, but is also found southward, eastward and northward to Georgia, Pennsylvania and Assiniboia, respectively. In lakes it inhabits the deep holes or areas where the bottom has been scoured by inflowing streams. In rivers it loves to hide under logs and rocks in the deep holes beneath dams and falls and amid swiftly flowing waters. It is a predaceous fish and devours all smaller species. The wall-eyed pike is a prolific spawner and great numbers of the fish congregate on shallow, well-cleaned bottoms for this purpose. Because of the fine quality of its flesh and the large size (10 to 30 pounds) which it attains, this fish is highly valued, and in the Great Lakes region ranks next to the white-fish in commercial importance. The smaller sand-pike or sauger (*S. canadense*) has a similar but less extended distribution and similar habits. Consult Jordan and Evermann, 'American Food and Game Fishes' (New York 1902).

Wall-flower, a cruciferous herb (*Cheiranthus cheiri*) of southern Europe, where it blooms on rocky cliffs and walls. The plant itself is not handsome, having crowded, twisted, lanceolate leaves, but is cultivated for the sake of its flowers, which are large and in short, head-like, terminal racemes. The petals are four-clawed and spreading, have a velvety surface, and range in color through all shades of yellow and orange to a rich mahogany-brown. They are frequently variegated with these hues, and might be the "streaked gilly-flowers, which some call nature's bastards," scorned by Perdita, of the 'Winter's Tale.' One of their common names, moreover, is gilly-flowers or wall-gilly-flowers. Wall-flowers are biennials, blooming from early spring until autumn, and are offered for sale in French and English cities during the winter. They have a strong and delicious odor of violets.

The native wall-flower of Australia is a leguminous plant (*Pultenea daphnoides*). In the United States, a cruciferous plant of dry plains, with orange-yellow large flowers, is known as the western wall-flower (*Erysimum asperum*).

Wall Paintings. See MURAL DECORATION.

Wall Paper, or Paper Hangings, called by the French *papier peint*, ornamental colored paper affixed to the walls of houses as a substitute for the ancient tapestry hangings. The Chinese appear to have employed paper for this use from time immemorial, and the English claim to have

first introduced the practice into Europe. On the other hand, the French assert that printed paper hangings were first made at Rouen as early as 1620 or 1630 by one François, and that the art was perfected in the latter part of the 18th century by Reveillon in Paris. It has certainly prospered more in France than in any other country; and so much taste and skill have there been developed in the manufacture, that the French papers have been sought for in preference to all others. In Paris are numerous factories of paper hangings, employing more than 3,000 workmen, in Lyons are three establishments, and one each at Mulhouse, Strasburg, and Metz. Others are found in Belgium, Germany, Holland, England, and Russia. In the United States the first wall paper factory was established in 1790 by John B. Howell at Albany, N. Y. Paper was at that time made only in sheets, and had to be joined before being printed. Color was then applied by means of a brush to form the background of the design, and the latter was subsequently printed upon the paper from wooden blocks, as many blocks being used as there were colors in the pattern, each block having a part of the pattern upon it in one color. One block was printed the whole length of the paper before the next color was applied. It should be stated that this method of printing by means of blocks still prevails, but only in connection with designs which, on account of their dimensions, or through some other peculiarity, cannot be printed on the cylinder-machines that have practically supplanted block or hand work, as it is termed. The method of applying color to the background by means of a hand-brush has, however, been done away with altogether. It does not appear that any other factories were established until about the year 1810, at which time a man named Boriken was engaged in the business. The Howell firm had meanwhile sold out their Albany business to Lemuel Steel, and, after a short experience in New York and Baltimore, had finally, in the year 1820, located at Philadelphia, Pa., where they have been established ever since, the present owners comprising the third and fourth generations engaged in the business. It was not, however, until 1844 that any decided advance was made in the growth of the industry. About that time paper in continuous lengths came into more general use, and the necessity of joining sheets together was obviated. In that year, also, the first machine for printing wall paper was imported from England and introduced into the Howell factory. While very crude, as it printed only a single color, it had a stimulating effect on the business, inasmuch as it enabled goods to be produced at a largely reduced price, and increased the volume of the business considerably. As near as can be ascertained, the entire production of wall paper in the United States at that time did not exceed \$250,000. The second printing apparatus was imported from England in 1846, this one printing six colors. Machines were subsequently built in this country, at first by the machinists connected with wall paper factories, but after a time a specialty of this class of work was made by William Waldron of New Brunswick, N. J. The printing-machine of to-day is unquestionably a great improvement on that originally imported into this country, although the prin-

WALL OF SEVERUS—WALLA WALLA

ple of its operation is practically the same. It is cylindrical in shape. The paper passes over the cylinder, the pattern being printed on it by means of rollers on which the design has been placed, each roller representing one of the colors used in the design. These rollers are registered so accurately that as the paper, in passing over the revolving cylinder, reaches one of them, it leaves the impression on the paper, and the succeeding rollers follow in regular order. The paper is hung up by an automatic process as it leaves the machine, and passes into drying-racks which are usually several hundred feet in length, after which it is rolled up in lengths of 8 to 16 yards, and is ready for market.

While the printing-machine is necessarily the most prominent feature of the business, yet other factors have contributed largely to the progress made by this industry. Among them are the grounding-machines, which furnish the background color to the paper; the bronzing-machines, which apply bronze powders to certain of the goods; the embossing-machines, which give various textures to the goods after they have been printed; the pressing-machines, which are used to make goods showing the design in relief; the machine or contrivance that is used to hang up the paper after it leaves the printing-machine; and a host of similar devices that enable the manufacturer to produce novel effects and manufacture the goods more rapidly than before, and at a lessened expense. It is these contrivances that have led to the tremendous progress achieved by this industry in the last 60 years, and more particularly within the last 30 years (the pace having been accelerated each year), which have enabled us to become independent of foreign manufacturers, and, notwithstanding a reduction of duties on wall paper, have caused a continued falling off in imports, so that at the present time importations of wall paper are simply nominal.

The improvements were such as were called for by the exigencies of the moment, slight at the time, but cumulative, and enabling the industry eventually to attain its present state of perfection. The most notable are as follows: (1) Soon after the introduction of the printing-machine one McKernan invented a contrivance for festooning the paper automatically as it leaves the printing-machine and passes on to the drying-racks. This was undoubtedly a long stride in the process of making wall paper, inasmuch as the speed of the printing-machine could be increased to the full capacity of the drying-racks connected with it. (2) The single (or continuous) process of making wall paper was introduced about the year 1870. Formerly the ground color had to be applied by one machine, after which the paper was dried and rolled up and next passed through the printing-machine to receive the impressions of the design thereon. In the continuous process the paper passes through the machine which applies a ground color for the design, and then passes through a drying apparatus that is termed a "hot box," or into drying-racks, and then automatically passes into the printing-machine which applies the colors of the design, saving a double handling of the goods and involving less waste. (3) The method of applying bronze powders to wall paper automatically was introduced about the year 1872, although, as it was conducted in se-

cret for some time by one or two firms, the discovery may have been made at an earlier date. This method reduced largely the cost of making bronze (otherwise termed gold) papers, and led to an increased demand and output of them. (4) The next and most recent discovery was the application to wall paper of bronze powders in a liquid state; that is, mixed with an adhesive material (made from potato-starch) of sufficient density to keep the bronze powders in solution without impairing their lustre. This was first placed upon the market about 1882, and as the new process enabled the use of as many different shades of bronze as there were colors in the design, the opportunity was afforded for producing many new and brilliant effects, and for superseding in a large measure bronze or gold goods made by the former method. While the mechanical part of the business has made vast strides, there is yet another feature that outranks it in importance, and that is the artistic element. The American people have a constant craving for something new, and the manufacturer is taxed to the full extent of his powers to satisfy this demand. On no industry does this demand fall more heavily than on wall paper manufacture, and by no occupation has the demand been more fully satisfied.

Wall of Severus. See HADRIAN'S WALL.

Wall Street "Corners". Since 1835 the famous corners in the American stock market have been as follows:

Year	Stock	Start's price	High price
1835	Morris Canal	30% below par.....	150
1835	Harlem River R.R.	123	200

Wall-tiles. See TILES.

Walla Walla, wōl'a wōl'a ("rushing water"), a tribe of the Shapshapian stock of North American Indians, formerly occupying the country about the lower Walla Walla River, and along the east bank of the Columbia River from the Snake nearly to the Umatilla, in Washington and Oregon. Their language resembles that of the Nez Percés. By treaty of 1855 they were assigned to the Umatilla reservation in Oregon, where they numbered 325 in 1901. See SHAPSHAPIAN.

Walla Walla, Wash., city, county-seat of Walla Walla County, on the Walla Walla River, 28 miles east of the Columbia River, and on branch lines of the Northern Pacific and the Union Pacific R.R.'s; 150 miles southwest of Spokane. A United States fort was established near the site of the city in 1857, and around this fort grew up a trading post and settlement; it was first called Steptoeville, but when the town was incorporated in 1859 the name of Walla Walla was adopted. It was first incorporated as a city in 1862, and received a second charter in 1884. The city is situated about 15 miles west of the Blue Mountain range, at an altitude of 1,060 feet; it is surrounded by the beautiful and fertile Walla Walla Valley, over 100 miles in length, forming a part of the "Inland Empire" between the Rocky and Cascade ranges, and

consisting of a belt of agricultural land, the larger part under cultivation, which yields large crops of wheat, oats, and barley, as well as vegetables and fruits. In this valley the city of Walla Walla is the centre of trade, and it has become one of the most important commercial cities of the eastern part of the State. It contains an extensive plant for the manufacture of farm machinery and implements and other manufacturing establishments, including gas and electric power works with important improvements under way (1910), two flouring mills, and lumber mills; and has five banks, of which two are national banks. Among its notable public institutions are the United States Land Office, United States District Court, an Odd Fellows' home for the State of Washington, the Stubblefield home for indigent widows and orphans, with \$135,000 of perpetual endowment, and two hospitals. Fort Walla Walla joins the city on the west, and six miles to the west is the monument to the memory of the martyred pioneer and patriot, Marcus Whitman. Walla Walla is also of importance as an educational centre; it has a public library and an excellent system of public schools, including a large high school, and is the seat of the far-famed Whitman College and Academy, a Roman Catholic seminary for girls and an academy for boys, and the St. Paul's seminary for girls (Protestant Episcopal), while Walla Walla College is located two miles outside the city near the fort. The city has an excellent supply of pure water from mountain streams, and a first-class system of waterworks owned and operated by the municipality. The government is vested in a mayor, elected annually, and a council of seven; the city officials are mostly elected by popular vote. Pop. (1890) 4,709; (1900) 10,049; according to the 1910 census, 19,364. Consult Lyman, 'History of Walla Walla County' (1901).

HOLLOW PARKER.

Wallaby, a native name applied to various small kangaroos (q.v.), especially those called brush-kangaroos, which frequent dense scrub-jungle and have great leaping powers. One of the largest species is the red-necked (*Macropus ruficollis*), which is 40 inches or more long, with a tail 30 inches in length; it is South Australian, and is represented in Tasmania by the smaller Bennet's wallaby. Several other species occur in Australia and Borneo, one of which (*M. thediti*) is very common and known to the colonists as pademelon (q.v.).

Wallace, wŏl'ŭs, Alfred Russel, English naturalist and philosopher; b. Usk, Monmouthshire, 3 Jan. 1823. He was educated at Hertford Grammar School, and afterward articulated to a land surveyor and architect. Later when resident at Leicester as English master at the collegiate school he made the acquaintance of Henry Walter Bates, like himself an enthusiastic entomologist, and in April 1848 the two sailed from Liverpool on a journey to the Amazon Valley, which marks an epoch in scientific travel. They ascended the Tocantins in August 1848, and in the following year ascended the Amazon. In March 1850, they separated, Wallace taking the basin of the Rio Negro for his ground and Bates that of the Solimões or Upper Amazon. Wallace returned to England in 1852, and in 1853 published 'A Narrative of Travels on the Amazon and Rio Negro.' An-

other result of this journey was a small work on 'Palm-Trees of the Amazon and their Uses' (1853). Of still greater importance to the progress of modern biological geography and philosophy was his eight years' residence (1854-62) in the islands of the Malay Archipelago, because it led him to the formulation of his theory of natural selection, and produced that scientific classic, 'The Malay Archipelago, the Land of the Orang-Utan and the Bird of Paradise: a Narrative of Travel, with Studies of Man and Nature' (1869). His natural selection theory was contained in a paper 'On the Tendency of Varieties to Depart Indefinitely from the Original Type,' which he sent to Mr. Darwin in 1858, and on 1 July of that year it was read at a meeting of the Linnean Society with a statement of the practically identical theory which Darwin had been elaborating independently for many years. His work in Malaysia is fittingly commemorated by the application of his name to the imaginary line (Wallace's Line) between Bali and Lombok, which, as he showed, marked the boundary between an Asiatic and an Australian fauna in the archipelago. In 1870 he published 'Contributions to the Theory of Natural Selection,' and in 1876 issued the first thoroughly scientific treatise on zoogeography, 'The Geographical Distribution of Animals, with a Study of the Relations of Living and Extinct Faunas as elucidating the Past Changes of the Earth's Surface.' This subject was further developed in the more popular work, 'Island Life, or the Phenomena and Causes of Insular Faunas and Floras, including a Revision and attempted Solution of the Problem of Geological Climates' (1880). 'Tropical Nature and other Essays' (1878) contains suggestive papers on sexual selection, color in nature, and similar subjects, and was reissued, with modifications and additions, in one volume with 'Contributions to the Theory of Natural Selection' in 1891. In 'Darwinism: an Exposition of the Theory of Natural Selection, with some of its Applications' (1889), he gives a final and masterly statement of the theory of organic evolution as he conceives it, with abundant illustrations from his first-hand knowledge of the facts. He stands by pure Darwinism, refusing to admit the additional elements, such as sexual selection, which Darwin himself adopted in his later works. He refuses to extend evolution to the development of mind, and he adopts Weismann's views on heredity. In short, he holds by organic evolution only in so far as it is consistent with or required by a spiritual interpretation of man and nature.

Wallace's work has been by no means confined to natural history. In 1866 he issued a work on 'The Scientific Aspects of the Supernatural'; and in 1875 gave in 'Miracles and Modern Spiritualism' a full statement of his spiritualistic faith. He issued in 1885 a pamphlet entitled 'Forty-Five Years of Registration Statistics, proving Vaccination to be both Useless and Dangerous.' He gave evidence before the recent Royal Commission on the subject, and in 1898 published 'Vaccination a Delusion, its Penal Enforcement a Crime,' in which he endeavored to prove that the majority report of the commission is opposed to the best evidence laid before it. In 'Land Nationalization: its Necessity and its Aims' (1882) he compares the landlord-and-tenant system of land tenure with

WALLACE

an occupying tenancy under the state, and strongly advocates the latter. A Land Nationalization Society, of which he is president, has been formed to disseminate the principles of his book. 'Bad Times: an Essay on the Present Depression of Trade' (1885) is another contribution to economics. He prepared the volume 'Australasia' (1879) in Stanford's 'Compendium of Geography and Travel,' and to the new issue contributed the first of the two volumes on Australasia, dealing with Australia and New Zealand (1893). In 1868 he published 'The Wonderful Century, its Successes and its Failures,' a review of the 19th century; and in 1901, 'Studies, Scientific and Social.' He was awarded the Royal Medal of the Royal Society in 1868, the Gold Medal of the Société de Géographie in 1870, the Darwin Medal of the Royal Society in 1890, the Founder's Medal of the Royal Geographical Society, and the Gold Medal of the Linnean Society in 1892.

Wallace, David Duncan, American historian: b. Columbia, S. C., 23 May 1874. He was graduated at Wofford College, Spartanburg, S. C., in 1894, where he became professor of history and economics in 1899. He has published 'Constitutional History of South Carolina, 1725 to 1755' (1899), and several historical monographs.

Wallace, Sir Donald Mackenzie, English writer: b. 11 Nov. 1841. He was educated at the universities of Edinburgh, Berlin, and Heidelberg, and at the Ecole de Droit, Paris. He was private secretary to the viceroy of India in 1884-9, attended the czar's wedding during his tour in India and Ceylon in 1890-1, was director of the foreign department of the *Times* in 1891-99. He has published 'Russia' (1877); 'Egypt and the Egyptian Question' (1883); 'The Web of Empire' (1902); etc.

Wallace, John Findley, American civil engineer: b. Fall River, Mass., 10 Sept. 1852. He was educated at Monmouth College and the University of Wooster, and in 1869-70 was engaged in railway service. In 1871 he became assistant engineer of the United States Engineers, and was appointed county surveyor and city engineer in 1878. He has been engaged as chief engineer and superintendent on various railroads since 1879, and in 1891 entered the service of the Central Railroad, becoming general manager of the Illinois Central system in 1902. In 1904 he was appointed chief engineer in charge of building the Panama Canal. On 29 March 1905 he with the other members of the commission, resigned, was reappointed on 3 April, but again resigned 24 June 1905.

Wallace, Lewis (better known as "Law"), American soldier and author: b. Brookville, Franklin County, Ind., 10 April 1827; d. Crawfordsville, Ind., 15 Feb. 1905. He studied law; at the beginning of the Mexican war enlisted as second lieutenant in the 1st Indiana infantry; in 1848 began professional practice, which he carried on at Covington, Ind., and Crawfordsville, Ind., and for four years was in the State senate. At the outbreak of the Civil War he was appointed adjutant-general of Indiana and soon afterward colonel of the 11th Indiana volunteers; on 3 Sept. 1861 was made a brigadier-general of volunteers; and for ability displayed

in leading a division at Fort Donelson (q.v.) was made major-general of volunteers 21 March 1862. He participated in the second day's fight at Shiloh, and in the advance on Corinth; was president of the court of inquiry regarding Don Carlos Buell (November 1862); in 1863 prepared the Cincinnati defenses, and later was made commander of the Eighth army corps, with headquarters at Baltimore. At the battle of the Monocacy (9 July 1864) he was defeated, but detained the enemy until Wright, with reinforcements, could reach Washington before Early. In 1865 he resumed law practice; in 1878-81 was governor of New Mexico, and in 1881-5 was minister to Turkey. He published 'The Fair God' (1873); 'Ben Hur' (1880); a 'Life' of Benjamin Harrison (1888); and 'The Prince of India' (1893).

Wallace, William, American manufacturer: b. England 1825; d. Washington 20 May 1904. Early in life he came to the United States with his father and established the firm of Wallace & Sons at Ansonia, Conn., which soon became one of the leading manufactories of copper and brass alloys in the United States. Becoming associated with Moses G. Farmer (q.v.), they began the manufacture of a compound telegraph wire, consisting of a steel core and an electrotyped copper covering, thus giving conductivity and strength, combined with lightness. In 1876, at the Centennial Exhibition, he brought out the Farmer-Wallace dynamo machine, with which the buildings were successfully lighted, being the earliest general electric lighting in this country. A year or two later he devised a plate arc lamp for use with this machine, by means of which a number of arc lights could be placed in series on the circuit, thus originating the series method of arc lighting. For several years before his death he was engaged in scientific investigation, especially in work with the microscope.

Wallace, Sir William, Scottish patriot and hero: b. probably Elderslie, Renfrewshire, about 1272; d. London 24 Aug. 1305. Owing to the want of contemporary Scottish records, the real facts regarding his life and achievements remain in much obscurity, many incidents resting solely on the authority of Blind Harry, who wrote about 200 years later, and can hardly be regarded as a serious historian. Wallace is represented as having been for some years engaged in a partisan war against the English before what is represented by Blind Harry as the turning-point in his career took place, the burning of the town of Lanark and the murder of Heselrig, the sheriff. This incident is ascribed to May 1297. Soon after, he attacked Ormesby, the justiciar, while holding a court of justice at Scone, and Bek, bishop of Durham, at Glasgow, whom he put to flight. Among the followers of Wallace about this time was William of Douglas, the representative of a great Border family, which subsequently contributed invaluable aid to the war of independence. Sir Henry Percy and Sir Henry Clifford were sent to repress the Scottish rising. Wallace took most of the northern fortresses, and was besieging the Castle of Dundee, when he heard that the enemy was advancing upon Stirling. He took up a position encompassed by a loop of the Forth in front of the Abbey Craig, a hill near the Abbey of Cambuskenneth. Sur-

WALLACE—WALLACK

rey determined to attack him, and the English crossed the Forth on a narrow bridge from early morn till near noon, while the Scots were drawn up as spectators of their passage on the hill (11 Sept. 1297). When Wallace deemed the enemy sufficiently divided he attacked those who had crossed with his whole force, sending at the same time a detachment to secure and hold the head of the bridge. The victory was complete. Cressingham was killed, and Surrey fled to Berwick. After this Wallace appears with the title of guardian of the kingdom, which was temporarily cleared of the English, and is found conducting an invasion, or series of organized raids into England. In 1298 Edward entered Scotland with an army estimated at 7,000 men-at-arms and 80,000 footmen. Wallace retired before him, wasting the country, but was at length overtaken at Falkirk in a position where he was compelled to fight. He drew up his army on an inclined plain with his horsemen, about 1,000, in the rear (23 July 1298). The footmen were arranged in circles, the bowmen in the centre, and the spear-men in the front rank kneeling. In this order they resisted for a time the attacks of the English men-at-arms, but the circles were gradually broken, and the army routed. After this Wallace for a time disappears from the scene. The council of regency which succeeded him carried on the war for some time with spirit; but on 9 Feb. 1304 they and their followers were admitted to King Edward's peace. Wallace was excepted by name. He was then in the country, and every exertion was made to secure his apprehension. It was effected through Sir John de Menteith, governor of Dumbarton Castle. He was conveyed to London, through which he was carried on 22 Aug. 1305. He was put on trial at Westminster before a special commission, and was executed for treason and rebellion, though he had never recognized Edward, and the latter explicitly claimed dominion over Scotland as a conqueror only. He appears in literature in Porter's 'Scottish Chiefs' (1810), and Buchanan's 'Wallace: A Tragedy' (1856). Besides the histories of Scotland and others relating to the period consult the biographies by Carrick (3d ed. 1840); Tytler (2d ed. 1845); Moir (1886), and Muirson (1898); the edition of Blind Harry by Jamieson (1820); and Stevenson, 'Wallace Papers' (1842).

Wallace, William Harvey Lamb, American soldier: b. Urbana, Ohio, 8 July 1821; d. Savannah, Tenn., 10 April 1862. He removed with his father to Illinois in 1833, studied law and in 1846 was admitted to the bar. At the outbreak of the Mexican war he enlisted as a private, later becoming adjutant, and served at Buena Vista and in other operations until the end of the war, when he returned to his law practice. He became district attorney in 1853 and in 1861 he was appointed colonel of volunteers in the Union army. He commanded a brigade at Fort Donelson, February 1862, was promoted brigadier-general, and in the battle of Shiloh commanded Smith's old division. The brigade withstood an assault of six hours and was last to leave the field, Wallace falling, mortally wounded, in the resistance.

Wallace, William Vincent, Irish musical composer: b. Waterford 1 July 1813; d. Château de Bagen, in the Pyrenees, France, 12 Oct. 1865. He gave evidence of great musical ability, be-

came a skilful player on several instruments, and in 1829 was organist in Thurles cathedral. His enthusiasm was stimulated by hearing Paganini play in 1831, and in 1834 he played a violin concerto composed by himself. He went to Australia in 1835 and worked at sheep-farming. But soon returned to music, and traveled to New Zealand, where he had a romantic escape from assassination by the Maoris. His later travels proved very profitable from a financial point of view. He returned to London in 1845, and toward the end of that year his popular opera of 'Maritana' was produced at Drury Lane with great success. 'Matilda of Hungary' (1847) was damaged by an exceedingly bad libretto. After a voyage to America he again settled in England in 1853, and in 1860 'Lurline,' a better work than 'Maritana,' was produced with even greater success at Covent Garden. Other operas were the 'Amber Witch' (1861); 'Love's Triumph' (1862); 'The Desert Flower' (1863); and 'Estrella,' the last left unfinished at his death.

Wallace's Line, an imaginary line, so called in compliment to Alfred Russel Wallace (q.v.), separating the Oriental from the Australian faunas. It passes between the Sulu and Philippine Islands, along the Straits of Macassar and between Lombok and Java. The fauna west of this line is strikingly different from that east of it, although the opposite shores of dividing waters are sometimes only a few miles apart. See ZOOGEOGRAPHY.

Wallachia, wô-lă'k-ə, southern Europe, a former principality, united with Moldavia in 1861 to form the kingdom of Rumania. See RUMANIA.

Wallachian, or Cretan, Sheep, a variety of long-haired domestic sheep, bred in Wallachia and its neighborhood, remarkable for the development of the horns. The horns of rams spring almost perpendicularly from the frontal bone, and then take a beautiful spiral form; and those of the ewes protrude nearly at right angles from the head and then become twisted in a singular manner. The disadvantage of such head-appendages has led to the diminution rather than the increase of the breed.

Wallack, wôl'ak, James William, American actor: b. London 24 Aug. 1795; d. New York 25 Dec. 1864. He made his first appearance on the stage when a child. In 1813 he began his permanent career, playing as Laertes in 'Hamlet' at Drury Lane. He made his first visit to the United States in 1818, and subsequently for 20 years lived alternately in England and in the United States, playing at different times in all the principal cities of the Union. In 1820 he became stage manager at Drury Lane, and in 1837 opened the National theatre in New York. This was destroyed by fire in 1839, and in 1852 he opened Wallack's Lyceum, rebuilt as Wallack's theatre in 1861. His career as actor and manager was uniformly successful and in the presentation of comedy he had few equals. As a manager he was greatly aided by his knowledge of stage-effects and his artistic adaptation of scenery and costumes. Consult: Lester Wallack, 'Memories of Fifty Years' (1899).

Wallack, John Lester, American actor, son of James William Wallack (q.v.): b. New York 1 Jan. 1820; d. Stamford, Conn., 6 Sept.

1868. He made his debut as an actor in New York in 1847, succeeded his father as manager of Wallack's theatre, New York, in 1864, and conducted it with great success. He adapted several French comedies to the American stage, and in 1888 retired after having been identified with the American stage as actor and manager for 40 years. Consult his 'Memoirs of Fifty Years' (1889); Mackay and Wingate, 'Famous American Actors of Today' (1896).

Wallasey, wól'a-sí, England, an industrial town suburban to Liverpool, in Cheshire, two miles northwest of Birkenhead, near the seaward extremity of the Wirral peninsula, protected by the notable Wallasey embankment. The town has a workmen's institute, a 16th century reorganized grammar school, and is noted for its municipal ownership of public utilities, water, gas, electric-lighting, street railways, baths, cottage hospital, etc.

Wallenstein, väll'en-stín or wöl'en-stín (or more correctly WALDSTEIN), Albrecht Wenzel Eusebius, Von, duke of Friedland and Mecklenburg, and Prince of Sagan, German soldier: b. Hermanic, Bohemia, 15 Sept. 1583; d. Eger, Bohemia, 25 Feb. 1634. He studied under the Jesuits at Olmütz, and after accepting the Catholic faith finished his studies at the Universities of Altdorf, Bologna, and Padua. In 1717, on assisting the Archduke Ferdinand in the latter's war against Venice, he was raised to the rank of count and made a colonel. When Bohemia revolted, he raised a regiment of cuirassiers for the emperor and fought against Thurn and Bethlen Gabor. When the estates of the vanquished Bohemians were confiscated in 1620 and sold to imperial adherents at nominal prices, he purchased extensive tracts, including the domains of Friedland and Reichenberg. In 1623 he was made Duke of Friedland, and in 1624 his collective estates were elevated to a principality. He now applied himself to the care of these dominions. When the emperor was involved in new troubles by the Lower Saxon league in 1625 he offered to raise 20,000 men for the imperial service by his own efforts. In return, he was to have full control in the hostile provinces. Before he had completed his levy he was named generalissimo and field-marshal, and then set out at the head of 30,000 men to co-operate with Tilly (q.v.). On 25 April 1625, he gained a victory over Count Mansfeld at Dessau, and when that general proceeded at the close of the year to Hungary to join Bethlen Gabor, he followed and brought Bethlen to conclude a truce. In the campaign of 1627 he conquered Silesia, drove the Danish king out of Germany, and forced his way into northern Jutland, bought from the emperor the dukedom of Sagan, at a price in which his military expenses were reckoned. The estates of Mecklenburg having been forfeited in the war, he was invested in them, first as security for his expenses, and afterwards as a regular fief in 1629. The attempt to take Stralsund was wholly unsuccessful (1628). In 1630, owing to the jealousy of the nobles, Wallenstein was deprived of his command.

When Gustavus Adolphus invaded Germany, Wallenstein attempted to negotiate with him on his own account, but the distrust of the Swedish hero frustrating his intentions, he listened to the earnest entreaties of the emperor, and

again took the field, having procured a formal capitulation securing to himself almost absolute power. After some partial successes he encountered the King of Sweden at Lützen, 16 Nov. 1632, in which battle Wallenstein was defeated and Gustavus killed. After the death of the Swedish king he had reopened negotiations with the enemies of the emperor, by whose assistance he hoped to place himself at the head of affairs in Germany. The matter proceeded slowly as his offers were received with much mistrust, especially by the German princes; he resumed hostilities to make his value felt, then reopened negotiations. His proceedings were known at the court of Vienna; but he was at the head of an army largely consisting of foreigners, many of whose leaders were personally pledged to him alone. The emperor was not strong enough to remove him, and was base enough to have recourse to assassination. On 24 Jan. 1634, he signed a secret patent conferring the command of the army on Count Gallas, who was instructed to arrest Wallenstein and his associates, and throw them into prison. On 18 Feb. an open proclamation was made commanding the army to obey only Generals Gallas, Piccolomini, and others named. Wallenstein left Pilsen with some of his confidential associates on the 23d to take refuge in the fortress of Eger, which he reached on the 24th. Here he was assassinated on the evening of the 25th. The plenipotentiary of Saxony and Brandenburg had reached Zwickau, and the plenipotentiary of France Frankfort, on their way to Wallenstein's headquarters, when they received word of his death. The emperor openly rewarded the assassins, among whom were two Scotchmen and two Irishmen, Gordon, Leslie, Butler, and Devereux. Wallenstein's overtures to the enemies of the empire have been represented by his partisans as *ruses de guerre*.

A vigorous controversy has been waged over the matter. As an organizer and leader of armies he must be ranked among the great commanders. In a time of excessive confusion he maintained a statesmanlike control of difficult affairs. His career was made the basis of Schiller's trilogy of 'Wallenstein.' Consult the lives by Förster (1834); von Ranke (5th ed. 1895); Aretin (1846); Hurter (1855); Förster's ed. of the 'Briefe Wallensteins' (1828-9); Schebek, 'Die Lösung der Wallensteinfrage' (1881); Bilek, 'Beiträge zur Geschichte Wallensteins' (1886); Schulz, 'Wallenstein und die Zeit des dreissigjährigen Krieges' (1898). See THIRTY YEARS' WAR.

Waller, wól'ér, Edmund, English poet: b. Coleshill, Hertfordshire (now in Buckinghamshire), 3 March 1666; d. Beaconsfield 21 Oct. 1687. He was educated at Eton and King's college, Cambridge, and is said to have been returned a member of Parliament for Amersham in his 16th year. In 1625 he was returned for Chipping Wycombe, and he sat for other places in several parliaments, including the Long Parliament. On the death of his wife in 1634 he courted Lady Dorothea Sydney, whom he celebrated in his verses under the name of 'Sacharissa' and Lady Sophia Murray, whom he distinguished by the name of 'Amoret,' both without success. In Parliament he at first opposed the court party, but retained his place

in the Long Parliament, and openly expressed his royalist sentiments after the Civil War began. He was sent as a commissioner from Parliament to the king after Edgehill, and soon after this occurred the incident called Waller's plot. Its nature is not clearly understood, though Waller made an abject confession of all he knew, including the names of his confederates, some of whom, his near relatives, were put to death. This event in his life is introduced in Beatrice Marshall's story 'An Old London Nosegay' (1904). He was imprisoned for a year, fined £10,000, and exiled. During this exile the first collection of his poems was published in 1645. In 1653 he obtained permission from Cromwell to return to England, and in 1654 he addressed a 'Panegyric to the Lord Protector.' In 1656 he recommended him in another poem to assume the royal title. Shortly after a poem on the death of the lord-protector, he addressed one to the king on his majesty's happy return. The proceedings of Monk apparently had not been anticipated. He again sat in Parliament, at intervals of cessation, till the reign of James II. Burnet says his popularity in Parliament was great, but he did not take pains to understand its business, but only studied to gain applause, being a vain and empty, though a witty man. His poetry was celebrated for elegance and polish at a time when these graces had been comparatively little studied, but it is destitute of all great qualities. Consult: Gosse, '17th Century Studies' (1897).

Waller, Frank, American artist and architect: b. New York 12 June 1842. He was educated at the Free Academy in New York, studied art in Rome (1870-71), and the next year made a sketching tour in Egypt. He was a founder and the first president of the Art Students' League and since 1888 has devoted his attention to architecture. Among his paintings may be cited 'Tombs of the Caliphs' (1874); 'A Caravan in the Desert' (1878); 'Eventide: Venice' (1883); 'Hop Picking' (1885). He published 'Report on Art Schools' (1879).

Wallin, väl-lén, Johan Olof, Swedish poet and ecclesiastic: b. Dalarna, Sweden, 15 Oct. 1779; d. Upsala, Sweden, 30 June 1839. He studied at Upsala and in 1806 was pastor of the Royal Military Academy. He subsequently held pastorates at Solna, Ulriksdal and Vesterås, and in 1837 was made Archbishop of Upsala. His hymns and religious songs are in high repute in Sweden, and he was called by Tegner 'David's Harp of the North.' Among his poems are 'The Educator,' a didactic poem in Alexandrines; verses on George Washington, 'Homesickness' and 'The Angel of Death,' one of his best known poems. He was a notable pulpit orator. His collected works in two volumes appeared in 1878.

Wallingford, wöl'ing-fôrd, Conn., borough, New Haven County; on the Quannipiac River, and on the New York, New Haven & Hartford Railroad; about 22 miles south of Hartford and 12 miles north of New Haven. The borough has broad, regularly laid-out streets, lined with large elm trees. The chief manufacturing establishments are sterling silver, silver-plate and nickel works, rubber goods factory, and brass goods factories. Britannia and iron-ware

are among the manufactures. The government census of 1900 gives the number of industrial establishments of the whole town (which includes two villages, East Wallingford and Yalesville, besides the borough) as 73; the capital in plants, \$5,382,134; the number of wage earners, 2,270; amount paid each year in wages, \$1,160,551; amount paid annually for raw material, \$2,813,410; average annual value of products, \$5,238,280. The town is one of the oldest settlements in Connecticut; it received its present name in 1670. In 1850 a branch of the Oneida Community (q.v.) was located here. The property is now owned by the Free Masons and the State Masonic Home has been erected here. There are two banks; the national bank has a capital of \$150,000, and the two banks have deposits amounting to \$864,890. There are six churches, a public high school, The Phelps School for Girls, a number of graded schools, and a public library. Pop. (1880) 3,017; (1890) 4,230; (1900) 6,737. The population of the town is, (1890) 6,584; (1900) 9,001; (1910) 11,155.

Wallingford, Vt., a town in Rutland County, on Otter Creek and the Bennington & Rutland Railway, 9 miles south of Rutland, 59 miles southwest of Montpelier, and about 11 miles southwest of Killington Peak. Included in it are the villages of Wallingford, South Wallingford, and East Wallingford. It has 2 hotels, 4 churches, a public high-school, and manufactures of harness, tinware, coffins and caskets, and agricultural implements. Pop (1910) 1,719.

Wallis, wöl'is, John, English mathematician: b. Ashford, Kent, 23 Nov. 1616; d. Oxford 28 Oct. 1703. He was educated at Emmanuel College, Cambridge, took holy orders, and in 1647 became chaplain to a Yorkshire baronet. He was one of the first members of the scientific association which became later the Royal Society, and in 1649 was appointed Savilian professor of geometry at Oxford. He was particularly skilful in the art of cryptography, or deciphering; and having by this means been enabled to render considerable service to the royal cause, he was on the Restoration of Charles II. made one of the royal chaplains. In 1661 he was one of the divines appointed to revise the Book of Common Prayer; and when the Royal Society was founded in 1663 his name was included in the list of the earliest members; and he added much to the reputation of that body by valuable contributions to the 'Philosophical Transactions.' Among his mathematical works the most important are: 'Arithmetica Infinitorum'; 'Mathesis Universalis, sive Opus Arithmeticum'; 'Mechanica, sive de Motu Tractatus geometricus'; 'De Sectionibus Conicis Tractatus'; and his 'Algebra.' He also published editions of Archimedes, Ptolemy, Aristarchus, and Porphyry. His complete works, including various treatises on theology, were published at Oxford (1692-9).

Wallis, Sm Provo William Parry, English naval officer: b. Halifax, Nova Scotia, 12 April 1791; d. Funtington, near Chichester, England, 13 Feb. 1892. He entered the British navy as a midshipman in 1804; served against the French, and in the War of 1812 with the United States was second lieutenant on the Shannon. He

WALLIS—WALNUT

was on board this ship in the fight with the Chesapeake and upon the disablement of the captain and death of the lieutenant, Wallis took command and conducted the prize to Halifax, receiving promotion to commander in recognition of his services. He was aide-de-camp to the queen in 1847-51, and in the last named year was promoted rear-admiral. He became vice-admiral in 1857, admiral of the white in 1863, and of the fleet in 1877. Contrary to the usual rule of retirement at the age of 70 Wallis was retained on the active list until his death, and for many years he was the only surviving flag-officer who had fought in the Napoleonic wars and in the war with America in 1812.

Wallis, Severn Teackle, American lawyer: b. Baltimore, Md., 8 Sept. 1816; d. there 11 April 1894. He was graduated from Saint Mary's College, Baltimore, in 1832, and was admitted to the bar in 1837. He became corresponding member of the Royal Academy of History at Madrid in 1843, and in 1849 went to Spain as United States agent to examine the title to public lands in east Florida as affected by the treaty of 1819. He was elected to the Maryland legislature in 1861 and there took a firm stand against action of the North in regard to the Civil War. He was imprisoned by the Federal Government for 18 months together with other prominent Marylanders and then released. He resumed his law practice and in 1870 was elected provost of the University of Maryland. He published: 'Glimpses of Spain' (1849); 'A Discourse on the Life and Character of George Peabody' (1870); etc.

Wallis Archipelago, Pacific Ocean, a group of islands northeast of Fiji, with an area of 40 square miles. They were placed under a French protectorate in 1887, have a French resident, and are in regular communication with Nouméa. Pop. est. 4,500.

Wallkill (wál'kíl) River, a river taking its rise in Sussex County, N. J., and flowing north and northeast through Orange and Ulster counties, N. Y. About 6 miles from the Hudson it joins the Rondout Creek, and below the junction the stream is sometimes called the Wallkill. The Wallkill is about 120 miles in length and furnishes considerable water-power.

Wallon, vā-lôn, Henri Alexandre, French historian: b. Valenciennes, France, 23 Dec. 1812; d. 13 Nov. 1904. He was educated in the Normal School at Paris, and in 1840 was appointed to the chair of modern history and geography at the Sorbonne. He was elected to the Legislative Assembly in 1849 but resigned in the following year; became a member of the National Assembly in the year 1871; and in 1875-6 was minister of public instruction. The complete establishment of the republic was largely due to his amendment, the 'Amendment Wallon,' carried 30 Jan. 1875, which subsequently gave him the sobriquet 'Father of the Republic.' In 1876 he became a member of the senate. His writings include: 'De l'Esclavage dans les Colonies' (1847); 'Jeanne d'Arc' (2 vols., 1860); 'La Vie de Jésus et son Nouvel Historien' (1864); 'La Terreur, Etudes Critiques sur l'Histoire de la Révolution Française' (1872); 'Les Représen-

sentants du Peuple en Mission, etc.' (1793-41 5 vols., 1888-90): etc.

Walloon, wó-loonz', the inhabitants of the Ardennes plateau, Southern Belgium, who are chiefly of Celtic or Roman extraction, and speak the French language, in distinction to the northern inhabitants of German race and language. The name is probably analogous to that given by the Germans to other foreign races, as the Walachians, Gauls, Welsh, etc. See *Belgium, People*.

Walnut, a tree of the genus *Juglans*, and of the order *Juglandaceæ*. The species, of which about 10 have been described, are natives of the northern hemisphere, being confined to the temperate parts. In America they are found as far south as Mexico. They are characterized by rough bark, compound leaves aromatically fragrant when bruised, staminate flowers in catkins, pistillate flowers in few to many flowered racemes and followed by large drupes with inedible husks and hard nuts, the kernels of which are valued in some species for food, dessert or the oil they yield upon expression. A majority of the species are prized for park planting because of their hardness and the graceful form they acquire when well established. For this purpose the most esteemed in America is probably the black walnut (*Juglans nigra*), which has a range from the New England States to Minnesota and southward to the Gulf States, but has now become rare and costly. It is a graceful and imposing tree which often reaches 150 feet in height, has usually an erect trunk and a broad airy round top. It is also valued to some extent for its rough hard-shelled nuts which are often seen in the markets. Its wood is one of the most highly prized native woods, being used extensively for furniture making, interior finish of houses where "natural woods" are used, its deep brown tint making rich contrasting effects with other woods. Several other species also furnish nuts found in various markets where the trees are native and the husks of several are used for dyeing and tanning. The species most esteemed for its nuts is, however, the Persian or "English" walnut (*Juglans regia*), which is indigenous from China to southeastern Europe. It has been cultivated for centuries in the Mediterranean region, whence it has been taken to mild climates throughout the world. The tree is only about half as large as the preceding species but is much the same in appearance. Its nuts have smoother, softer shells and usually finer flavored kernels. This nut is one of the most important of the world. Only during the closing half of the 19th century, however, has it been grown commercially in the United States, and here only in California. The crop marketed in 1901 from this state was officially estimated at about 6,000 tons, worth a little more than \$1,000,000. Since the planting of orchards has been fairly active in the sections adapted to the tree the yields since that date have increased. In 1903, 825 car-loads were shipped to eastern markets. Besides these home supplies large quantities are imported from the Mediterranean region but these importations will probably dwindle into insignificance when Californian orchards come into full bearing.

Since the trees seem to be exacting in their

demands, the areas in which they can be cultivated are somewhat restricted. They are considered susceptible to frosts after their growth has started though fairly hardy while dormant; they seem to be unable to stand hot weather since the nuts are more or less injured; they seem to fail upon lands in which standing water is nearer the surface than 20 feet, also in soils with hard clay subsoil and in poorly drained soils. They are thus almost restricted at present to the deep alluvial soils of the four southern counties of California, but by planting varieties which vegetate late in the spring and by avoiding the conditions mentioned it is believed that the region of successful cultivation may be extended even into the northern counties. The seeds are planted about 12 inches asunder in nursery rows 4 feet apart, cleanly cultivated, irrigated during midsummer and hardened off by withholding the water in autumn. They will usually be under 2 feet in height when one year old when they are root-grafted to desirable varieties. The grafts will often grow 8 feet during the first year. Either when one year or two years old the plants are set in permanent quarters about 50 feet apart. Little pruning is needed except to correct bad form, the branches being started about 4 feet from the ground. The orchards are kept cleanly cultivated throughout the season, the first plowing in spring being at least 6 inches deep. Irrigation is also given if needed; always during the winter. The trees of even the most precocious varieties rarely produce profitable crops before six years old and ten years is nearer the average age. Trees reach full bearing when about twenty years old and continue for thirty years or more. Some trees in Europe are said to be more than 100 years old. When the nuts begin to fall they are shaken down, gathered by women and children usually and spread on trays to dry for a week. The nuts are then graded into sizes by passing them over sieves after which they are dipped in a bath of soda, chloride of lime and sulphuric acid to bleach the brown shells and give them the ecru tint demanded by the market. After dipping they are rinsed in clear water. Formerly sulphur was used for this purpose but it was found to impair the quality of the nuts and has been abandoned. After drying the nuts are again graded into light and dark. The latter with the broken ones are used by confectioners; the former are shipped to market in sacks holding about 110 pounds.

Consult: U. S. Dept. of Agriculture, Division of Pomology, 'Nut Culture in the United States.'

Walpi. See TUSAYAN.

Walpole, wôl'pôl, Horace, EARL OF ORFORD, English wit and letter-writer: b. London 5 Oct. 1717; d. there 2 March 1797. He was the fourth son of Sir Robert Walpole (qv.) He was educated at Eton and King's College, Cambridge, on leaving which (1739) he traveled two years on the Continent. Returning in 1741 he took his seat in the House of Commons as member for Callington, Cornwall, and he sat for various constituencies up to his resignation in 1767. He always took a lively but superficial interest in politics, inclining sentimentally to extreme opinions. His parliamentary career

requires no particular record, but it may be mentioned that in 1757 he exerted himself earnestly in behalf of Admiral Byng (see BYNG, JOHN). In 1747 he purchased Strawberry Hill, near Twickenham, where he erected a Gothic villa, laid out the grounds with minute ingenuity, and made it a principal business of his life to adorn and furnish it according to a fantastic but refined and educated taste, with objects of curiosity and antiquarian interest, rare prints, pictures, books, and manuscripts. His maintenance was provided for by some sinecure appointments. To his antiquarian taste he added authorship, first in verse and afterwards more extensively in prose, and in 1757 established a private printing-press at Strawberry Hill, at which he printed not only his own works but those of others, his editions often selling at very high prices on account of the small number printed. In 1791 he succeeded his nephew in the peerage. He never took his seat in the House of Lords, and appears to have avoided using his title. His works are numerous. His first publication was a description of Sir Robert Walpole's pictures, printed privately in 1747, under the title of 'Aedes Walpolianae.' In 1757 a popular satire appeared called 'A Letter from Xò Hò, a Chinese Philosopher at London, to his Friend Lien-Chi, at Peking,' 'Fugitive Pieces in Verse and Prose,' and 'Catalogue of the Royal and Noble Authors of England,' with lists of their works, appeared in 1758. 'Anecdotes of Painting in England' were published in 1762-71. 'The Castle of Otranto' (1764), a romance, regarded as the prototype of the work of the 'School of Terror,' which subsequently became popular, is very variously estimated. Praised by Byron and Sir Walter Scott, it is pronounced by Hazlitt dry, meagre, and without effect. 'The Mysterious Mother,' a tragedy, and 'Historic Doubts on the Life and Reign of Richard III,' appeared in 1768. The works on which his reputation now chiefly rests are his 'Letters,' of which the best edition is that edited by Peter Cunningham (1857-9), and 'Memoirs' and 'Journal,' a series embracing the reigns of George II. and III. from 1751 to 1763. Walpole is almost unanimously pronounced the best of English letter-writers, whose unflinching ease and vivacity in treating of politics, art, foreign affairs and other topics are unlike anything else in English literature. The memoirs are more bitter and cynical, but both are valued as a store-house of the more evanescent traits of contemporary history, being full of passing topics and occurrences, anecdotes, characters, and portraits. Though a keen and able he was not, however, an accurate or impartial observer. Want of depth and earnestness in his own character, his party prejudices, his vanity and love of effect, tempered all he wrote, and detract from the weight of his evidence. Few writers, however, are more uniformly entertaining. Walpole's manners were affected both personally and as a writer. He was as fastidiously aristocratic in his personal notions as he was sentimentally liberal in his political opinions, and in both he was probably conventional rather than sincere. Of the value of his writings as a chronicle of current events much has been made, but there is a tendency to ascribe to him elegance alone, to the neglect of his substantial

WALPOLE

literary merits. The complete works appeared in an edition of 1708. Consult further: Cunningham's edition of the 'Letters' (1857-9); Warburton's of the 'Memoirs' (1851); Robins, 'Catalogue of the Classic Contents of Strawberry Hill' (1842); Macaulay's essay in the 'Edinburgh' for October 1833; Cobbett, 'Memorials of Twickenham' (1872); Seeley, 'Horace Walpole and His World' (1884); and the 'Life' by Austin Dobson (1890; 2d ed. 1893).

Walpole, Sir Robert, EARL OF ORFORD, English statesman: b. Houghton, Norfolk, 26 Aug. 1676; d. there 18 March 1745. He was educated at Eton and King's College, Cambridge, and became a good classical scholar. On the death of his elder brother in 1698 he resigned his scholarship, in 1700 entered Parliament as member for Castle Rising, and in 1702 was elected for King's Lynn. He became a leader of the Whig party, and soon distinguished himself by attention to business, and, though not an orator, by practical debating power. In 1708 he was appointed secretary-at-war, and intrusted with the management of the House of Commons. He was one of the managers of the impeachment of Sacheverell (q.v.) (1710), though privately opposed to that measure. Soon after this the Whigs were dismissed from office. On the meeting of Parliament in 1712 he was convicted of a high breach of trust and notorious corruption, the charge being due wholly to party hostility. He was expelled from the House of Commons, and imprisoned in the Tower. By his party Walpole was regarded as a martyr. He refused to make any submission, and wrote a pamphlet in his own defence. He remained in prison, or held his levee in the Tower, till the prorogation. He was returned again for King's Lynn, after the dissolution in 1713, and resumed his place and influence in the House. In the first ministry of George I. (1714) he was appointed paymaster of the forces. He was also in 1715 made chairman of the committee to impeach the late ministers, Bolingbroke, Ormonde, Oxford, and Stafford. In October he was made first lord of the treasury and chancellor of the exchequer. In April 1717, a split having occurred in the ministry, Walpole resigned, and made himself formidable in opposition. He opposed the quadruple alliance and the South Sea Scheme, in which, however, he did not disdain to speculate and make a fortune. In 1720 he again took office as paymaster of the forces, and was intrusted with the measures rendered necessary by the failure of the scheme. (See **SOUTH SEA BUBBLE**). On the resignation of Sunderland he again became chancellor of the exchequer and first lord of the treasury, 3 April 1721, and for 21 years held the highest office in the state without interruption. During his long administration the Hanoverian succession, to which he was zealously attached, became firmly established, a result to which his prudence and political sagacity largely contributed. He promoted by an enlightened policy the commercial prosperity of the nation, and relieved the weight of taxation by many improvements in the tariff. He was the first English minister after the Restoration to make particular study of commerce and finance, and it was he who laid the basis for the free-trade

and colonial policies of Great Britain. To the war with Spain he was decidedly averse. In February 1742, two days before his resignation, he was created Earl of Orford. So long a period of office did not of course pass without opposition. In 1733 his important excise bill failed to pass, and during the later years of his ministry he encountered increasing difficulties. When, after successive defeats in Parliament, he resigned, he was consulted by the king as to his successors, and allowed to stipulate for his own immunity. An attack was soon, however, made upon him in Parliament, and a committee of secrecy appointed to inquire into his administration. The committee's report charged him with having used undue influence at elections, with granting fraudulent contracts, and with peculation and profusion in the use of the secret service money. The king exerted himself to frustrate the inquiry, and on the other hand the committee did not gain credit for impartiality. The prosecution against Walpole was dropped for want of evidence. He took little further part in public affairs, but was frequently consulted by the king. Walpole has been characterized by Burke as an 'intelligent, prudent, and safe minister.' He was ambitious for power, but had above his contemporaries an understanding of true national interests. Consult: Various standard histories of England; Coxe, 'Memoirs of Sir Robert Walpole' (1798); the studies by Ewald (1877) and John Morley (1890); 'Historical Sketches of the Reign of George II.' in 'Blackwood's' for April 1868; 'Original Papers' (ed. Macpherson 1775); King, 'Political and Literary Anecdotes' (1818); Macpherson, 'Annals of Commerce,' vol. iii. (1805); Courtney, 'Parliamentary Representatives of Cornwall' (1889).

Walpole, Sir Spencer, English historian, son of Spencer Horatio Walpole (q.v.): b. England, 6 Feb. 1839; d. London, 8 July 1907. He was educated at Eton and entered the war office in 1858. He became inspector of the fisheries in 1867, lieutenant-governor of the Isle of Man in 1882 and in 1893-9 was secretary to the post-office. He was knighted in 1898. He wrote 'A History of England from 1815' (1878-86); 'The Electorate and the Legislature' (1881); 'Life of Sir John Russell' (1889); 'The Land of Home Rule' (1893); etc.

Walpole, Spencer Horatio, English statesman: b. 11 Sept. 1806; d. London, 22 May 1898. He was educated at Trinity College, Cambridge, was called to the bar in 1831 and in 1846 became queen's counsel. He was home secretary in 1852 and in 1856-82 sat in Parliament for Cambridge University. He was again home secretary for a few months in 1858, and was an unofficial member of the cabinet in 1867-8. From 1887 until his death he was high steward of Cambridge University.

Walpole, Mass., town in Norfolk County; on the New York, New Haven & Hartford Railroad; about 20 miles southwest of Boston. It contains the villages of South Walpole, Walpole, and East Walpole. It was settled in the 17th century, but was laid out as a town about 1720, and in 1724 was incorporated. The chief manufacturing establishments are a furniture factory, paper mill, and cotton factory. There

are eight churches, a high school, and 15 district schools. Pop. (1910) 4,892.

Walpole, N. H., town in Cheshire County; on the Connecticut River, and on the Fitchburg Railroad; about four miles below Bellows Falls and 19 miles northwest of Keene. It is in an agricultural region, on a high bank which has an almost precipitous descent of several feet. The place was founded in 1745 on a site granted by Massachusetts in 1735, and in 1752 confirmed or re-granted, by New Hampshire. There are six churches, a high school, several graded and district schools, and a public library which contains about 6,000 volumes. The bank has deposits amounting to nearly \$300,000. Pop. (1910) 2,668.

Walpurga, wäl-poor'gä, **Walburga**, or **Walpurgis**, Saint, German abess: b. England; d. 778. She was sister of Saint Willibald, first bishop of Eichstadt, in Germany, and niece of Saint Boniface, the apostle of the Germans. She went, like her uncle and brother, to Germany as a missionary, and became, about the middle of the 8th century, abess of a convent at Heidenheim, in Franconia. She must have been a learned woman, as she was considered the author of a Latin description of the 'Travels of Saint Willibald.' After her death she received the honors of a saint, was believed to work many miracles, and chapels in honor of her were built in many places. From the circumstance that in German almanacs the name Walpurgis has been accidentally placed, sometimes alone, sometimes together with the names of the apostles Philip and James, against the first of May, the night previous to the first day of May, so famous in German legends for the assembling of the witches, has been called Walpurgis Night. The first of May is an important day for the German cultivator; many contracts are made at this time; the labors of the field assume new activity, etc. It is not strange that, on so important a day, the devil and the witches were supposed to be more active than usual, and to assemble in a particular place to organize the work of evil. This superstition, however, may have had its origin in the ancient German mythology. Hence straw was burned in many places on the Walpurgis night, with a view of dispersing the malignant beings—a custom still preserved in some places. The chief convocation of the witches was considered to take place on the Brocken. Many customs connected with the first of May in Germany originated in this superstition.

Walrus, or **Morse**, an arctic marine pinniped mammal of the genus *Odobenus*, of which two species are recognized—the Atlantic (*O. rosmarus*), and the Pacific (*O. pacificus*). The walrus is allied to the hair seals (see **SEALS**), from which it is distinguished by having the upper canine teeth largely developed, and growing from persistent pulps to form tusks. These may attain a length of 15 inches or more, and grow downwards, and slightly inwards. They serve the animal as weapons, as tools in digging up from the sand of the bottom of the sea the mollusks upon which it mainly subsists, and in climbing out upon ice-cakes or rocks of the shore. They are much larger in the males than in the females. The walrus is ordinarily 10 to 12 feet long, with a girth of nearly as much, but is said sometimes to attain a length of 20

feet. The muzzle is abruptly truncated, with long and remarkably strong bristly moustaches; small eyes; external ear wanting, though the orifice is distinctly visible; hind limbs short, connected by a membrane which covers the tail; fore limbs strong and stumpy, all with five digits. The hide is of a tawny brown color, with difficulty penetrated by bullets, and has been likened to a tough, flexible coat of mail.

Walruses are gregarious, and are found on the seashore and on ice floes. They are said to be monogamous, and the female brings forth at nine months one calf, usually on the ice floes. In disposition they are quiet and inoffensive unless attacked, or during the mating season, or when their young are in danger; when they become desperately aggressive, and furiously attack the hunters on the ice or in boats. The walrus is now confined to the regions within the Arctic Circle, though its extinct ancestors had a much wider geographical range, occurring numerous in ancient times as far south as Denmark and Nova Scotia in the Atlantic, and about the Aleutian islands on the northwest coast. Owing to reckless slaughter by sealers and whalers, they are greatly decreased even in the Arctic seas, and the few remaining seek unfrequented spots in high latitudes inaccessible to sealers. The tusks alone have now any commercial value, but formerly walrus hides were used for various purposes, such as machine bands, etc.

Consult Allen, 'North American Pinnipeds' (Washington 1880); and standard authorities.

Walsall, wäl'säl, England, a manufacturing town of Staffordshire, eight miles north-northwest of Birmingham. The environs present much fine scenery, and the town is handsomely built. The chief buildings and establishments are a modern parish church, with tower terminating in a lofty spire, and other places of worship; a free grammar, blue-coat charity, and other schools; a town-hall and jail; a public library and news-room; county court, a handsome structure with a Doric colonnade; a technical school; and four public parks. The situation of the town gives it great advantages for carrying on the iron manufacture, which forms a leading industry; the chief articles consisting of ironmongery, including coach and carriage harness mountings, buckles, chains, locks, keys, screws, files, edge-tools, gas-tubes, etc. Saddlery and harness are extensively made, and are the staple of the town. There are also brass and iron foundries, machine-shops, tanneries, and establishments for currying, dyeing, and japanning hides, malt-works, and clothing-factories; and in the vicinity extensive lime-works, and both coal and iron pits. Walsall is of considerable antiquity, but the existing town is almost entirely of modern origin.

Walsh, wölsh, Robert, American lawyer: b. Baltimore, Md., 1784; d. Paris, France, 7 Feb. 1859. He was educated at the Roman Catholic College, Baltimore, and at the Jesuit College, Georgetown, D. C., traveled in Europe until 1809, and on his return studied law, was admitted to the bar, and established a law practice at Philadelphia. Later he entered journalism, and in 1811-13 published the 'American Review of History and Politics,' the first quarterly issued in the United States. He edited the 'American Register' in 1817-18, and

in 1819 established the Philadelphia 'National Gazette,' which he conducted until 1836. He revived the 'American Review' in 1827 and edited it until 1837. He removed to Paris in 1836, was United States consul there in 1845-51, and continued his residence in that city until his death. He wrote: 'Letter on the Genius and Disposition of the French Republic' (1810); 'Appeal from the Judgment of Great Britain Respecting the United States' (1819); 'Didactics: Social, Literary, and Political' (1836); etc.

Walsingham, wôl'sing-am, Sir Francis, English statesman: b. Chislehurst, Kent, in or about 1530; d. London 6 April 1590. He studied at King's College, Cambridge, and traveled on the Continent until early in the reign of Queen Elizabeth. He was introduced to public service by Cecil. His first embassy is said to have been to France about 1561. He resided in France as ambassador from August 1570 to April 1573, and on his return was made principal secretary of state and a privy-councillor, and soon after knighted. In 1578 he was ambassador to the Netherlands, in 1581 to France, and in 1583 to Scotland. After having the chief direction of the measures for the discovery of Babington's conspiracy, he was appointed one of the commissioners for the trial of Queen Mary in 1586. He was afterwards made chancellor of the duchy of Lancaster. He retired from public life some time before his death. It is somewhat remarkable that so little is known of Walsingham's career; but he worked in secrecy and dealt mainly in intrigue. He is said to have had 53 private agents and 18 spies at foreign courts, and many stories are told of his diplomatic profundity. In his private character Walsingham is said to have been ascetically strict in his morals and puritanic in his religious zeal. An account of Walsingham's embassy to France appeared in a work by Sir Dudley Digges, entitled 'The Complete Ambassador,' published in 1655; and a work entitled 'Arcana Aulica' has been wrongly ascribed to Walsingham himself.

Walter, wâl'ter, John, English publisher: b. 1739; d. Teddington, Middlesex, 16 Nov. 1812. He was first engaged as a coal merchant, in which business he accumulated a considerable fortune, but lost it in subsequent operations as an underwriter. In 1782 his attention was attracted to an invention of one Henry Johnson, who had patented in 1778 and 1780 a printing device known as logotypes, or fonts containing entire words or syllables instead of letters. In 1784, having purchased the Johnson patents, he opened a printing office in London known as the Logographic Office, and engaged in publishing books. On 1 Jan. 1785 he issued the first number of a small newspaper, 'The Daily Universal Register,' "printed logographically," which was really the first number of the 'Times,' though that name was not assumed until 1 Jan. 1788, when 'The Times, or Daily Universal Register' appeared, the alternative title being dropped in the succeeding March. The 'Times' was not immediately a success, and the logographic process had eventually to be abandoned, but Walter seems to have derived some profit from his book printing, and gradually the 'Times' became a power in the land. In 1786, however,

Walter was convicted of having printed a "libel," the offense having been the statement that the Dukes of York, Clarence, and Cumberland were insincere in their congratulations on the king's recovery. He was sentenced to a year's imprisonment in Newgate, to stand in the pillory for one hour, pay a fine of £50, and to enter into recognizances for his good behavior for seven years. He was subsequently sentenced to a second year's imprisonment before the expiration of the first and further fines of £200 on other libelous charges, but was pardoned after 16 months at Newgate. Broken in health and spirit at his continued misfortunes Walter retired from the management of the business in 1795.

Walter, John, English editor and publisher, son of the preceding: b. London 23 Feb. 1776; d. there 28 July 1847. He was studying for the ministry at Oxford, when in 1797 or 1798 his father summoned him to London to assist in the management of the 'Times.' From the date of his assumption of the management a new spirit was manifested in the paper, and in 1803 he became sole manager. He maintained an independent course, which, while it made the reputation of the 'Times,' cost it editor the little official patronage it had enjoyed. For 18 years the firm had been printers for the board of customs, but in 1805, in consequence of criticism of Lord Melville's administration of the admiralty department, he was deprived of the employment. His enterprise had increased the circulation of the 'Times' from 1,000 to 5,000 copies in 10 years, notwithstanding the continued opposition of the government. In 1805 he made arrangements for obtaining foreign news and in 1807 sent Henry Crabb Robinson (q.v.) to Germany, the first of the afterward numerous class of special correspondents; and though every measure possible was used by the government to delay his foreign despatches, Walter frequently published foreign information days before the same intelligence was officially received by the government. He afterward frankly admitted that smuggling was the only means by which he could obtain French journals. Ultimately the 'Times' took its place as the leading English journal, and Walter may be considered as its real creator. On 29 Nov. 1814 he issued his paper printed by König's steam machines, the first paper to be printed by that method. He acted as editor of the paper until after 1810, but from that time entrusted a share of the editorial work to Sir John Stoddart. In 1832-7 he sat in Parliament for Berkshire, but resigned in the latter year because of differences with his constituents; was returned for Nottingham in 1841, but was unseated in the following year. His later years were spent chiefly in retirement.

Walter, Thomas Ustick, American architect: b. Philadelphia, Pa., 4 Sept. 1804; d. there 30 Oct. 1887. His early training was received in the office of William Strickland, and in 1830 he launched out for himself, building the Moyamensing Penitentiary in 1831. In 1847 he completed Girard College from his own designs, a building which has always been admired for the classic purity of its proportions. This classical motif he carried out also in his extension of the national Capitol at Washington, D. C., to which he added its noble dome.

WALTERBORO — WALTHAM

He erected many public buildings at Washington, including the Post-office, and the Government Hospital for the Insane. He was one of the original members of the American Institute of Architects, professor of architecture in Franklin Institute, and lecturer on architecture in Columbia College.

Walterboro, S. C., town, county-seat of Colleton County; on the Charleston & Savannah Railroad (Plant System), about 20 miles west of Charleston. It is in an agricultural region, in which cotton is one of the chief products. It has cotton mills, lumber mills, naval stores, lumber yards, and large store houses. The two banks have a capital of \$35,000. Pop. (1910) 1,690.

Walters, wâl'ters, William Thompson, American merchant and art collector: b. on the Juniata River, Pa., 23 May 1820; d. Baltimore, Md., 22 Nov. 1894. He was educated to be a civil engineer, but became interested in the coal and iron industry, and while in charge of a smelting establishment in Pennsylvania produced the first iron manufactured from mineral coal in the United States. He removed to Baltimore in 1841, and established himself as a wine merchant there in 1847. He was president of the first steamship line between Baltimore and Savannah and was one of the reorganizers of the Southern lines. In 1861-5 he resided in Europe, where he traveled widely in the interest of art, and purchased numerous additions for his collection. He was United States commissioner at the Paris expositions of 1867 and 1878, and also to that at Vienna in 1873. He was a trustee of the Corcoran Art Gallery at Washington, D. C., and of the Peabody Institute. His private collection was one of the largest and most valuable in the United States, and his annual exhibit of his gallery for charity netted \$30,000 for the poor of Baltimore. He wrote: 'Barye' (1885); 'Notes Upon Certain Masters of the 19th Century' (1896); etc.

Walthall, wâl'thal, Edward Cary, American soldier: b. Richmond, Va., 4 April 1831; d. Washington, D. C., 21 April 1898. Admitted to the bar in 1852, he began practice in Coffeeville, Miss., and was district attorney for the 10th judicial district of Mississippi 1866-61. He then entered the Confederate army as lieutenant, becoming brigadier-general in December 1862 and major-general in June 1864. He especially distinguished himself at the battle of Missionary Ridge, where he led his brigade over a ridge and held back the Federal troops till the Confederate army made its escape; and he covered the retreat of General Hood's army after the defeat at Nashville. He practised law in Grenada, Miss., 1871-85, when he was appointed a United States Senator to fill out the unexpired term of Lucius Q. C. Lamar. He was elected for full term in 1888 and in 1892, was chairman of the committee on military affairs, and served on the committees on the improvement of the Mississippi River and on public lands.

Waltham, wâl'tham, Mass., city in Middlesex County; on the Charles River, and on the Boston & Maine Railroad; 10 miles west of Boston. It is connected by electric railway with Boston, Newton, and many of the places in the vicinity.

Industries.—The chief manufacturing establishments are the two watch-making works. At the American Waltham Watch Works, the first successful attempt was made to manufacture watch movements, on a large scale, by machinery. It is now the largest watch factory of its kind in the world. In 1814 a cotton mill was erected here, the first in the United States in which, under the same roof, the raw material was put through all necessary forms, even through the bleachery and the dye works, and came out the finished cotton cloth of the market. Other manufactories are saddlery and harness works, foundry and machine shops, wagon and carriage factories, emery wheel works, lumber mills, furniture factories, and men's clothing factories. In 1909 (government census) Waltham had 80 industrial establishments—employing 6,287 persons, to whom was paid annually \$3,695,000. The cost of the materials used each year was \$2,444,000, and the plants were capitalized for \$12,871,000. The value of the annual products was \$7,814,000.

Public Buildings and Municipal Improvements.—The principal public buildings are the government building, the municipal buildings, banks, churches, and schools. There is one large park and a number of small squares. The waterworks are owned and operated by the city. The main business streets and many of those in the residential sections are paved. The roads leading to the near-by villages and towns are well made and kept in good repair. The pure water, favorable climate, and good sewerage make the place most healthful.

Churches and Schools.—There are 15 churches representing 10 different denominations. The educational institutions are the Massachusetts School for the Feeble-Minded, the Waltham Nurses' Training School, the Notre Dame Normal Training School, a public high school and two private schools doing high school work: Saint Mary's School (R. C.) and Waltham New Church School (New Jerusalem Church). There are several commercial schools and Mellor's Commercial College, public and parish graded elementary schools, public evening schools, several private schools, a public library which contains about 30,000 volumes, and several school libraries.

Banks.—There are two banks, one national and one state bank. The national bank has a capital of \$150,000; and the two banks have deposits amounting to \$4,183,990, the state bank alone has deposits of \$3,459,990. The surplus and profits are \$206,970.

Government.—The government is administered under a charter of 1893 which provides for a mayor elected annually and a common council. The mayor appoints, subject to approval of the council, the majority of the administration officials, but the board of education is chosen by popular vote.

History.—Waltham was settled by farmers in the early days of the colony. The first incorporation was that of Watertown, which then embraced the territory now included in Waltham. In 1738 Waltham was set off from Watertown and incorporated as a town; and in 1884 it was granted a city charter.

Pop. (1900) 23,481; (1910) 27,834.

Consult Hurd, 'History of Middlesex County.'

WALTHAM ABBEY — WALTON

Waltham Abbey, or Waltham-Holy-Cross, England, a market town of Essex, 12 miles north by east of London, on the left bank of the Lea. It consists chiefly of one irregular main street; and has a spacious Norman church, which once formed the nave of the famous abbey church of the Holy Cross, where King Harold is buried. There are here government manufactures of gunpowder and percussion-caps, cordite, and small-arms, besides breweries, flour-mills, etc. The old abbey of Waltham was founded or enlarged by King Harold in 1060, and is said to have once possessed a fragment of the cross on which Christ suffered. In the neighborhood are the village of Waltham Cross, and an 'Eleanor cross,' recently restored. Pop. about 8,000.

Walther von der Vogelweide, wäl'tër fôn dër fô'gël-vî-dê, German lyric poet of the class of *Minnesingers*: b. about 1160; d. about 1227. He was descended from a noble but not wealthy family, whose castle, Vogelweide, is supposed to have been situated in Tyrol. Walther resided at the court of Frederick, the eldest son of Leopold VI., duke of Austria, and on Frederick's death in 1198 left the court of Vienna and entered on a series of wanderings. He remained longest at the splendid court of the Landgrave of Thuringia, who had always around him a circle of poets, and instituted that celebrated poetic contest, the war of the Wartburg (1207), in which Walther took part. Walther shows himself, in his political poems, a warm partisan of the imperial interests against the Papacy. The Emperor Frederick II. was also a patron, and bestowed on him a small fief. His poems, all of which are lyric, have been published by Lachmann (1827). Consult: Milmanns, 'Leben und Dichten Walthers von der Vogelweide' (1882); Schönbach, 'Walther von der Vogelweide, ein Dichterleben' (1895).

Waltner, wäl't-nâr, Charles, French copper-plate engraver and etcher: b. Paris 24 March 1840. He studied painting under Gerome and took up engraving with Martinet and Henriquet-Dupont. In 1868 he carried off the Prix de Rome. As an etcher and engraver he has been very successful in reproducing paintings in black and white. His chief works are 'Portrait of the Baron von Biege,' after Rubens (1870); 'The Infanta Marguerete,' after Velazquez; 'Rembrandt,' after the portrait by that master himself; 'The Entombment,' after Vandyck; the 'Angelus,' after Millet; 'Christ Before Pilate,' after Munkacsy (1882); 'The Watch,' after Rembrandt (1885); and 'Portrait of a Rabbi,' after Rembrandt.

Walton, wâl'tôn, Brian, English Biblical scholar: b. Yorkshire 1600; d. London 29 Nov. 1661. He was graduated at Cambridge and from a curacy advanced through many preferments to a prebend in Saint Paul's. At the Restoration he was made chaplain to Charles II. and bishop of Chester. His greatest work is 'Biblia Sacra Polyglotta' (6 vols. folio 1657). This work comprises the Hebrew original of the Old Testament, the Samaritan Pentateuch, the Chaldee, Syriac, Arabic, Persian versions, and the Latin Vulgate with various readings, notes, etc., still thought to be 'the most complete Biblical apparatus in any language.' He wrote in 1658 his 'Dissertation on the Antiquity and Authority of His Texts,' in later editions called the

'Prolegomena,' under which name it was published in the original Latin (1827-8). 'The Considerator Considered,' etc. (1659), was written in answer to Dr. John Owen's 'Vindication of the Purity and Integrity of the Hebrew and Greek Texts,' etc., a criticism on Walton's great Biblical work.

Walton, George, American patriot: b. Frederick County, Va., 1740; d. Augusta, Ga., 2 Feb. 1804. He was apprenticed to a carpenter, but studied law at night by the light of pine-knots, in 1774 was admitted to the bar, and began practice in Augusta. Together with three others he called a meeting at Savannah 27 July 1774 for the purpose of discussing measures of resistance against the arbitrary proceedings of Great Britain and was one of a committee inviting co-operation from the sister colonies. Later he was one of the committee which prepared a petition to the king and in 1776 was sent as a delegate to the Continental Congress. He was one of the signers of the Declaration of Independence, and continued a delegate to Congress until 1781. He was appointed colonel of militia in 1778 and commanded a battalion under Howe when Savannah was captured by the British in September 1778, was seriously wounded, taken prisoner, and held until September 1779. He was chosen governor of Georgia in the following month, was chief justice of the State in 1783, 1787, and 1793; re-elected governor of Georgia in 1789, and in 1795-6 was United States senator.

Walton, Isaak, English author: b. Stafford 9 Aug. 1593; d. Winchester 15 Dec. 1683. After receiving a school education in his native town he went to London and was apprenticed to an ironmonger. In 1618 he was made free of the Ironmongers' Company and seems to have retired with a competency in 1644. The statement frequently made that he was a sempster or haberdasher is unsupported by recent research. He early became closely acquainted with Dr. John Donne, Sir Henry Wotton, and other famous men; and was a strong royalist and the friend of prominent royalists. Doubtless, after Marston Moor, he devoted himself much to fishing. Walton's fame rests on 'The Compleat Angler, or the Contemplative Man's Recreation: Being a Discourse of Fish and Fishing, Not Unworthy the Perusal of Most Anglers.' It was published in 1653, and went through five editions in his lifetime. The 5th edition, issued in 1676, contained, as a second part, Charles Cotton's treatise on fly-fishing, written to correspond with Walton's, and designated 'Instructions how to Angle for Trout or Grayling in a Clear Stream.' The chief subsequent editions are those by Moses Browne (1750), Sir John Hawkins (1760), Major (1824), Sir Nicholas Harris Nicolas (1836), Jesse and Bohn (1856), Marston (1888), Harting (1893), Lang (1896). There is a facsimile reprint of the first edition by Elliot Stock (1876), republished in 1877, 1880, and 1896. Lowell wrote the introduction for an American edition of 1889. Walton also wrote almost equally famous biographies of John Donne (1640), Sir Henry Wotton (1651, in 'Reliquiæ Wottonianæ'), Richard Hooker (1665), George Herbert (1670), and Robert Sanderson (1678). The first four were published together in 1670, and have been often reissued, as for instance, under the editorship

WALTON--WAMPUM

of A. H. Bullen (1884) and Austin Dobson (1898). Besides the short pieces of poetry in his works, Walton wrote other occasional and prefatory verses, which are to be found in R. H. Shepherd's 'Waltoniana' (1878). The charm of 'The Compleat Angler' is due to its purity and simplicity of style, the ease and unaffected humor of the dialogue, and its exquisite pictures of natural scenery, combined with the picture that it presents us of the writer's own sunny and benevolent nature.

One Richard Franck, a Commonwealth soldier, displayed his contempt of a royalist angler's practical acquirements in his 'Northern Memoir' (1694). Consult further the lives by Zouch (prefixed to the 'Lives' in 1796; separately printed 1823); Nicolas (prefixed to the edition of the 'Compleat Angler' 1836), the basis of later works; Marston (1888); also Tweddell, 'Isaac Walton and the Earlier English Writers of Angling' (1854), and Blakey, 'Literature of Angling' (1856).

Walton, N. Y., village in Delaware County; on the New York, Ontario & Western Railroad; about 175 miles northwest of New York, and 18 miles southwest of Delhi. It is in an agricultural and dairy region, and the industries are connected with farm and dairy products. It has a foundry, machine shops, novelty works, and furniture factory. There are eight churches, a high school, graded elementary schools, and a school library. There is one national bank capitalized for \$50,000, with deposits amounting to \$450,000. Pop. (1920) 3,103.

Waltz, a dance executed by any number of couples, the gentleman having his arm around his partner's waist, the couple wheeling round on an axis of their own, and at the same time moving round the room. The music is written in triple time in crotchets or quavers. Compositions in waltz form are often not intended for dance tunes. See DANCING.

Walworth, wäl'wérth, Ellen Hardin, American writer: b. Jacksonville, Ill., 20 Oct. 1832. She was married to M. T. Walworth (d. 1873) in 1852. She was one of the three founders of the National Society of the Daughters of the American Revolution in 1890; was director-general of the Women's National War Relief Association in 1898; and one of the first three women elected to the school board under the New York law. She has been prominent in various club movements, and has lectured and written extensively. Her writings include: 'Battles of Saratoga' (1891); 'Parliamentary Rules' (1897); etc.

Walworth, Jeanette Ritchie Hadermann, American novelist: b. Philadelphia, Pa., 22 Feb. 1837. She was carefully educated and at 16 became a governess, but was shortly afterward married to Douglas Walworth, of Natchez, Miss. She has lived in different parts of the South, but has made her permanent home in New York. Her publications include: 'Forgiven at Last' (1870); 'Dead Men's Shoes' (1872); 'The Bar Sinister' (1885); 'Splendid Egotist' (1889); 'The Silent Witness'; 'An Old Fogey'; 'New Man at Rossmere' (1903).

Walworth, Reuben Hyde, American jurist: b. Bozrah, Conn., 26 Oct. 1789; d. Saratoga, N. Y., 21 Nov. 1867. He was mainly self-taught,

was admitted to the bar in 1809 and settled at Plattsburg, N. Y. He became master in chancery in 1811 and soon rose to eminence in his profession. He sat in Congress 1821-3, removing to Saratoga in the last-named year, was a circuit judge 1823-8 and chancellor of New York 1828-48. His decisions as circuit judge are included in 'Cowan's Reports' (9 vols. 1824-30); as chancellor, in 'Paige and Barbour's Reports' 14 vols. (1830-49). He published 'Rules and Orders of the Court of Chancery' (1829); 'Genealogy of the Hyde Family' (1864).

Wampanoag ("Eastern land"), a tribe of the Algonquian stock of North American Indians, closely related to the Massachusetts tribe, whose language they spoke. They were sometimes called Pokanokets, from their principal village, and Massasoits, from a prominent chief. The Wampanoags resided on Narragansett Bay, in Bristol County, R. I., and Bristol County, Mass., but originally they claimed the territory between Narragansett Bay and Pawtucket River and the Atlantic, including the islands of Nantucket and Martha's Vineyard. The Cape Cod branch of the tribe were visited by Gosnold in 1602, and by other whites at an early date. In 1617 many of their number perished from disease, prior to which time they claimed to have had 5,000 warriors, or about 18,000 souls. When the Plymouth Colony was planted in 1620 the Wampanoags inhabited 30 villages; Massasoit was their chief, and the treaty which he made with the colonists was faithfully observed by him until his death. He was succeeded by his son, popularly known as "King Philip," who, chafing under the ill-treatment which his people had suffered at the hands of the whites, aroused the resentment of all the Algonquian tribes from the Merrimac to the Thames (except the Wampanoags of Cape Cod and Martha's Vineyard), and in 1675 began a war against the whites which continued for two years and proved to be the most disastrous Indian conflict in New England history. The Indians were ultimately overcome, but not until Philip and other leading chiefs had been killed, and the Wampanoags and Narragansetts almost exterminated. Those who could, fled to the interior tribes, many captives were sold as slaves, and others joined the various "praying Indians" of southern Massachusetts.

Wampum, or **Shell Money**, a general name given to certain shells or shell-beads used as a medium of exchange among the Indians of the Atlantic Seaboard States. Not merely did it serve the Indian as a medium of exchange and a standard of values, but worn as an ornament it was his badge of wealth and position, in the hands of the chiefs his record book and ledger, and through the favor of the Great Spirit its possession became in no small degree the passport to the happy hunting grounds of the future world. The use of wampum constituted a bond of union among the Indians such as was scarcely supplied by language, religion or racial customs. Wampum was made from shells, usually clam or oyster, and it was therefore not surprising that the coast dwellers were the most prolific producers of it. The black beads were made from the dark "eye" of the shell, the scar indicating the point of muscular attachment, while the white ones were taken

WANAMAKER—WANTAGE

from the outer parts. Black beads were known as sacki, white ones as wompi, and the black were usually considered twice as valuable as the white. The beads themselves were simply little shell cylinders about one eighth of an inch in diameter and one fourth of an inch in length. They were polished smooth by being rubbed against stones, and were bored by means of a flint awl, many of which are still to be found in the shell heaps along the New England coast. The English colonists were compelled to use wampum as a medium of exchange with the Indians for over half a century. Rhode Island recognized it officially as late as 1670. In New York it was used until after the end of the century—as for instance in the payment of the ferry between New York and Brooklyn. It was used in Southern Connecticut as late as 1704, and in the backwoods regions of the northern and middle colonies well down into the 18th century.

Wanamaker, wōn'a-mā-kér, John, American merchant: b. Philadelphia 11 July 1838. He received a common school education, and began his business career at 14 as errand boy in a store. In 1861 he established, with his brother-in-law, a clothing store under the firm name of Wanamaker & Brown, which in 1869 became the firm of John Wanamaker & Co. From this beginning he built up a department store which is the largest in the city, and in 1896 established a similar store in New York in the building formerly occupied by A. T. Stewart's firm. In 1903 he began the construction of a larger building in New York, which is to be a station of the subway. He has been active in the public life of Philadelphia, taking a prominent part in the movement to secure pure water for the city, in 1886-87, and in other reform movements, and has taken part in State and national politics as an "anti-machine" Republican. In 1888 he was a presidential elector, and in 1889 entered President Harrison's cabinet as postmaster-general. During his term of office he established the sea post-offices, and strongly favored a postal telegraph system. He has taken an active part in religious work, was for several years president of the Philadelphia Young Men's Christian Association, and in 1858 organized a small Sunday-school which became the Bethany (Presbyterian) Sunday-school, one of the largest in the United States.

Wan'spurn Indians ("river people"), a tribe of the Shapthian stock of North American Indians—the Sokulks of Lewis and Clark. They range along both banks of the Columbia in Washington, from above Crab Creek down to the mouth of Snake River. Having never made a treaty or gone on a reservation, they are not yet officially recognized by the government. Pop. about 200.

Wandering Cells, or **Phagocytes**. See **PHAGOCYTOSIS**.

Wandering Jew. See **JEW**, **THE WANDERING**.

Wandering Jew, a name applied to various plants—in Great Britain to the beefsteak or strawberry geranium (*Saxifraga sarmientosa*) and to the Kenilworth ivy (*Linnæa cymbalaria*). *Zebina pendula*, a leafy rapidly growing plant, with lance-ovate leaves, glossy and bright green or purplish above with broad silvery

stripes, is also known as the wandering Jew; it will grow either in sun or shade, or in water alone. Another wandering Jew is a spider-wort (q.v.).

Wan'darley, João Maurício, BARON COTEGRZ, Brazilian statesman: b. Barro do São Francisco, Pernambuco, Brazil, 23 Oct. 1813; d. Rio de Janeiro, Brazil, 13 Feb. 1889. He studied law and soon entered politics, joining the Conservative party, and from 1842 was repeatedly elected deputy. In 1856 he became senator, holding the office until his death and acting as president of the body in 1882 and 1885. He was created a baron in 1868, was minister to the Platine republics in 1870, and concluded the treaty of peace with Paraguay. He was a cabinet officer in nearly all the Conservative cabinets and in 1885 organized the ministry which secured the general emancipation law.

Wanderoo', or **Wandru**, a large monkey (*Macacus silenus*) of southern India, especially the country bordering the Malabar coast. The wanderoos have long, slim bodies, covered with black hair, and tufted tails. The head looks very large, because of a mane, or ruff, and beard, which sticks out around the face, and is either gray or white, enhancing the sly look of the broad face, dull eyes, and broad muzzle.

The name is also given generally to monkeys of the genus *Semnopithecus*. *S. ursinus* is the great wanderoo of Ceylon, and Eastern zoologists think the term should be restricted to this species alone.

Wandsworth, wāndz'werth, London, England, a metropolitan and parliamentary borough on the south side of the Thames; area 9,130 acres. Wandsworth proper is situated close to the Thames, near the mouth of its small tributary, the Wandie, and is built between and on the slopes of two hills. New Wandsworth, a suburb of recent growth, lies to the east and south of both stretches of Wandsworth Common, beside which are the Surrey County prison, the county lunatic asylum, etc. There are many important industrial establishments. Pop. about 250,000.

Wang Shih-fu, wāng'sh'foo, Chinese dramatic poet. He lived in the 13th century, was the creator of the Chinese opera 'Thau-Khi,' and composed 13 plays, of which only two survive. The 'Hsi Hsiang Chi,' or 'Story of the Western Pavilion'—like all Chinese plays, a sort of novel in dialogue—is his best work and obtained and still holds great popularity with the Chinese. It has been called by Giles "of all plays of the Mongol dynasty, the one which will best repay reading." The other is the comedy, 'The State Minister's Feast.' The former was partly translated into French by Stanislas Julien (q.v.), the eminent French sinologist, in 'Europe Littéraire.'

Wantage, wōn'tāj, England, a market-town in Berkshire, in the fertile vale of the White Horse, 13 miles southwest of Oxford. There are an interesting old church, a town-hall, corn exchange, grammar school, and cottage hospital. Iron and brass founding, and the manufacture of sacks and similar articles are carried on. King Alfred, to whom there is a statue by Count Gleichen, erected in 1877, was born at Wantage, as was also Bishop Butler. Pop. about 4,500.

WANX RIVER--WAPPINGER

Wanx River. See **CAPE RIVER.**

Wapakoneta, wá'pá-kón-ét'a, Ohio, village, county-seat of Auglaize County; on the Auglaize River, and on the Cincinnati, Hamilton & Dayton Railroad; about 30 miles north of Piqua and 13 miles south by west of Lima. It is in an agricultural region and in the natural gas and petroleum belt. The place was visited by whites in the early part of the 19th century, and some settlements were made. It was laid out as a village in 1833. Where the village now stands was the site of an Indian village of importance, the meeting place of certain tribes. In 1831 it was the scene of the signing of the treaty whereby the Shawnees and Senecas relinquished their lands to the government. Wapakoneta was the last place in Ohio occupied by the Indians. The chief manufactories are furniture, wheels, machinery, and furnishings for dairies, and a machine shop. There are three banks, two national and one private. The national banks have a combined capital of \$300,000 and deposits amounting to \$1,245,400. Pop. (1910) 5,349.

Wapello, wá-pil'ó, Iowa, town, county-seat of Linn County; on the Iowa River, and on the Burlington, Cedar Rapids & Northern Railroad; about 31 miles north of Burlington, and 20 miles south of Muscatine. It is in a rich agricultural region in which the principal products are wheat, corn, vegetables, and fruit. Considerable attention is given to stock-raising. The manufacturing establishments are flour and lumber mills, fruit and vegetable canneries, agricultural implement shops, and creameries. The town makes large shipments of grain, canned goods, hay, and live stock. There are two banks, one State and one private. Pop. (1910) 1,326.

Wapentake, or **Wapentac**, in England, an ancient county among some of the northern shires, still retained in Yorkshire. It corresponds to the "hundred" of the southern counties. The word means "weapon-touching" and refers to the custom of the chiefs of a particular district meeting at a certain day at a specified spot, when the head chief, alighting from his horse, raised his spear in the air, and the inferior chiefs, also on foot, touched this spear with their lances, and so acknowledged their fealty.

Wapiti, an Indian name of the great North American deer (*Cervus canadensis*) known in the West as "elk," but more like the red deer than the European or true elk (q.v.). It formerly ranged from the mountains of the Carolinas to lat. 56 to 57° N., but now nearly extinct, except in the northern Rocky Mountains. It is closely allied to but considerably larger than the stag, standing about 64 inches at the shoulder; yellowish brown on upper parts; sides gray, long coarse hair in front of neck, like a dewlap; antlers large, often exceeding 4 or even 5 feet in length; brow-tine duplicated. The wapiti resembles the Old World stag or red deer rather than the elk. In the Northwest it is represented by several related species, but the Eastern wapiti seems doomed to extinction as a wild animal. During the winter these noble animals gather in large herds and feed on the open hills. The antlers are shed about March, and the new ones are complete by

September. The bucks fight fiercely and not infrequently with fatal result at the pairing season; and the stronger ones are polygamous, gathering into their herds every available cow and guarding them and the young with jealous care. They eat almost everything of a vegetable nature, leaves and twigs as well as grass and herbs. During the summer, when they are much troubled by mosquitoes and flies, they are fond of entering the water and of wallowing in mud holes. See **DUM.**

Wappene, wá-pil'óos, Johann Eduard, German geographer: b. Hamburg 17 May 1812; d. Göttingen 16 Dec. 1879. He was educated at the universities of Göttingen and Berlin, and in 1833-4 traveled in Brazil and the Cape Verde Islands. He became a tutor at Göttingen in 1838, was appointed adjunct professor there in 1845, and from 1854 until his death was full professor in that university. His most widely known work is his edition of the Stein-Hörchelmann 'Handbuch der Geographie und Statistik' (1871), of which he wrote the volumes on 'Universal Geography' (1849); 'North America' (1855); 'Central and South America' (1867); and 'Brazil' (1871). His other writings include: 'Untersuchungen über die geographischen Entdeckungen der Portugiesen unter Heinrich dem Seefahrer (1842)'; 'Deutsche Auswanderung und Kolonisation' (1846); 'Allgemeine Bevölkerungsstatistik' (1859-61); etc.

Wap'patoo, an aboriginal name of the root of the common arrowhead (*Sagittaria variabilis*) which was a favorite food of the North American Indians.

Wappers, wáp-ár, Gustav, BARON, Belgian painter: b. Antwerp 23 Aug. 1803; d. Paris 6 Dec. 1874. Educated at the Art Academy of his native city under Van Bree and Herreyna, he went to Paris and devoted himself to copying the masterpieces of the Venetian School and subsequently studied the style of Rubens, Jordans and the Flemish painters. He made the first great hit in 1830 by a large picture representing the 'Burgomaster Van der Werf of Leyden in the Spanish Siege.' Wappers surrounded himself with a number of young painters and under the enthusiasm he kindled a new school of Belgian painting came into existence. In 1832 he was appointed professor and eight years later director of the Art Academy of Antwerp; from 1846 to 1853 he was president of the Belgium National Museum and in 1847 was ennobled. Among his principal pictures are 'The People of Brussels Tearing up the Proclamation of Prince Frederick' (1835, in the Museum at Brussels); 'The Entombment' (1836, in Saint Michael's Church, Louvain); 'The Madonna in Clouds Surrounded by Angels'; 'Charles IX. Shooting Down the Huguenots'; 'Anne Boleyn Taking Leave of Elizabeth'; 'Boccaccio Reading His Decameron to Johanna of Aragon'; 'The Capture of Rhodes by the Turks,' etc.

Wappinger ("the east"), a confederacy of the Algonquian stock of North American Indians formerly occupying the territory extending eastward from Hudson River, between the neighborhood of Poughkeepsie and Manhattan Island in New York to the valley of Connecticut River in Connecticut. They were closely related to the Mohicans, and by most authorities

WAPPINGER FALLS— WAR AND PEACE

are regarded as having been a part of them. The component tribes of the Wappinger confederacy were: (1) the Wappinger, which formed the principal tribe and which occupied Dutchess County, N. Y., about Poughkeepsie and Wappinger Kill; (2) the Reggawawanks; (3) Wequaesgeeks; (4) Sintsinks; (5) Kitchawanks; (6) Tankiteks; (7) Nochpeems; (8) Siwanoy; (9) Sequins or Mattabesees. As Connecticut became colonized by the whites, the eastern tribes of the confederacy gradually sold their lands and almost dwindled away, the survivors finally joining the Indians at Scaticook, Conn., and Stockbridge, Mass., while a few went to Canada. The Hudson River tribes became involved in war with the Dutch colonists in 1640, which continued for five years, the Indians losing 1,600 of their number and the Wappingers being the chief sufferers. The survivors retained their tribal customs until 1756, and continued to occupy a tract in Westchester County, when most of them joined the Nanticokes, then living under Iroquois protection at Chenango, near Binghamton, N. Y., and finally became merged with the Delawares. Some of them also joined the Moravian and Stockbridge Indians, while a few still resided in Dutchess County just before the American Revolution.

Wappinger (wóp'in-jér) Falls, N. Y., village, Dutchess County; on Wappinger Creek, about two and one half miles from its mouth at New Hamburg, and seven miles south of Poughkeepsie. It is connected with Poughkeepsie by an electric line, and has the advantage of the steamer traffic on the Hudson. The river port used by the village is New Hamburg. The name of the village is that of a tribe of Indians who once inhabited this section. The creek here falls over a series of high ledges which form picturesque cascades, and also furnish water power for several manufactories. The chief industrial establishments are print-works, established in 1834; overall and sheeting factory, machine shop, grist mill, and creameries. The village has a union school, public and parish elementary schools, and a school library. There is one state bank, having deposits amounting to \$463,100. Pop. (1890) 3,718; (1900) 3,504; (1910) 3,195.

War. The last resort for the settlement of disputes is the appeal to physical force, whereby the weaker is either compelled to yield to the demands of the stronger, put to flight, or, in the last extremity, slain. War is resorted to either for advantage or for vengeance. The one party possesses something which the other has resolved to seize, or has inflicted some real or supposed injury on the other, which he determines to punish by the infliction of a corresponding chastisement. War and law are quite opposed to each other, but while opposed they are also related. The ultimate means of enforcing law is by physical force, but in every society the aim of law is to put down every appeal to force except on the part of the magistrate, and equally to restrict his use of it to the enforcement of the law. Where there is no organized society, every individual family, or group, enforces its own claims, and appeals to force are consequently frequent, but as society extends its organization these partial appeals to force are declared illegal and put down. But the society, however extended, is still partial; out-

side of it exist other societies with independent laws and different interests. Between these, disputes are liable to arise, which, failing mutual accommodation, can only be settled by force. In each society, moreover, the central authority is liable to vicissitudes of strength. When it is active and vigorous, the whole society is kept in equilibrium and repose; when it is weak or idle, private or party interests assert themselves, the laws are disobeyed and the central authority may be defied and overthrown. Thus, three conditions of warfare arise according to the degree of organization of society: the state of private war, when no great central authority has been established, or when it has been wholly destroyed, the state of civil war, when such an authority, having been established, has decayed, and the society arranges itself in different parties for the purpose of maintaining the old, or establishing a new central authority; and the state of international war, when states sufficiently powerful to control their own subjects quarrel among themselves. In each of these states war is continuous with and opposed to law.

The aim of law is always to control war, and either suppress it or render it subservient to its own enforcement or re-establishment; the aim of war is either to supplement the impotence of law, or accomplish some object forbidden by it. Hence the peculiarity of all laws relating to war. They are fluctuating in their nature, because the power to enforce them is frequently wanting; yet they are necessary, and in the end efficacious, because force can be applied in favor of law as well as against it, and it commonly becomes the interest of society in the long run so to apply it. It follows also from these conditions that as there are three states of warfare, so there are three relative states of law opposed to them: international law is opposed to international war, national law to civil war, and natural law to private war. In each case, law forms the boundary of war and war of law, so that where one is strong the other is weak. International law may thus be defined as consisting of those common principles which still continue to be recognized and observed by belligerents. The persistent disregard of any principle of law by a belligerent would annihilate it as a principle of international law, and as the belligerent has already set the power of its immediate antagonist at defiance, the only considerations which can enforce its observance of an international law are its own respect for its principle, or its fear of the power of neutrals. In like manner national law is opposed to and limits civil war. In as far as either party sets the national law at defiance the law is abrogated and can only be re-established by force; in as far as it is observed it controls the action of both parties. Private war is opposed by natural law because there is no positive law recognized by the parties. Violence is limited only by the power or conscience of the belligerents. See INTERNATIONAL LAW.

War and Peace, a novel by Count Lyof Tolstoi (1865-68). It deals with the stirring conflict between Napoleon and France, and Koutouzoff and Russia, and covers the period from 1805 to 1815. War is here treated not alone as a dramatic spectacle, but as a symbol of great social forces striving for expression.

WAR, CIVIL—WAR TARIFF

War, Civil. See UNITED STATES—CAUSES OF THE CIVIL WAR; MILITARY EVENTS OF THE CIVIL WAR; POLITICAL EVENTS OF THE CIVIL WAR; ETC.

War College. See ARMY WAR COLLEGE.

War Dance, among the American Indians, the name given a dance engaged in by the warriors of a tribe before a warlike expedition; a dance simulating a battle.

War Department, one of the executive divisions of the United States government, located at Washington, D. C. The department is under the supervision of a secretary of war, who is a member of the President's cabinet. The department has entire control of all matters relating to the equipment and discipline of the military forces of the United States, and is charged with the duty of carrying into effect all laws relative to the army and militia enacted by the Congress. The secretary's authority in military matters is second only to the President. The first secretary of war was Henry Knox of Massachusetts, whose term of office began with that of Washington. During the Civil War Edwin M. Stanton (q.v.) was the secretary of war. For a complete list of the successive secretaries of war see the article UNITED STATES—CABINET OFFICERS, ETC. See also ARMY OF THE UNITED STATES.

War-eagle, any eagle connected with war or the idea of war in symbolism or otherwise, as the imperial eagle (*Aquila mogolnik*) adopted as a standard first by a favorite legion and later by Roman troops generally; whence the symbol spread to the national insignia of many European countries. The war-eagle of the North American Indians, whose feathers ornamented their war-bonnets and other accoutrements, was the golden eagle (*A. chrysatus*). See EAGLE.

War God. Most ancient religions had their war gods, and in America, before the Spanish conquest, the Mexican war god was specially worshipped, with human sacrificial rites. Ares and Mars were the war gods of Greece and Rome respectively. The Jews evidently regarded Jehovah as presiding over their battles, and David is represented in 1 Samuel xvii. 45, as telling the Philistine that he comes "in the name of the Lord of hosts, the God of the armies of Israel." The same conception exists in some degree among Christians.

War Indemnity, the sum of money paid by the defeated country in an international war to the victorious government. The largest amount ever demanded in this way was \$1,000,000,000, which France was compelled to pay Germany after the war of 1870-71. In the war of 1866 Prussia took from Austria and her allies a war indemnity of \$41,750,000, besides \$3,750,000 requisition during the campaign. The war between Japan and China covered about nine months and the amount paid by the latter nation was \$185,000,000. For the Turko-Russian war of 1877, Russia demanded \$701,000,000, but her claim was reduced to \$160,000,000. Great Britain has received two indemnities from China, the first, in 1840, being \$25,000,000, and the second, in 1860, about \$10,000,000. The Sultan of Turkey was forced by the powers to reduce his claims of \$30,000,000 on Greece at the close of the war of 1877 to \$10,000,000. The settlement of war claims between the United States

and Spain at the end of the war of 1898 was unique. The American-Spanish War lasted four months, and cost the United States \$150,000,000. The Spaniards were defeated in every battle on sea and land, and finally sued for peace. A treaty was signed by President McKinley and by the Queen Regent of Spain in 1899 by the terms of which the United States relinquished all claims for indemnity of any kind, and agreed to send back to Spain, at its own cost, all Spanish soldiers taken prisoners, with their arms. The United States further agreed to pay to Spain the sum of \$20,000,000. On her part, Spain was to relinquish all claim of sovereignty over Cuba; to cede to the United States the island of Porto Rico, and other islands then under Spanish sovereignty in the West Indies; the island of Guam, in the Ladrões; and the archipelago known as the Philippine Islands. In this case it would appear that the victors paid for their success. At the close of the trouble between China and the powers, growing out of the Boxer uprising in 1900, it was agreed that China pay the powers 450,000,000 taels as an indemnity.

War Office, in Great Britain, the department of government which controls all matters connected with the army. The head of the department is the secretary of state for war. He has a seat in the cabinet, and a salary of \$25,000 a year is attached to his office. In the administration of the department he is assisted by a permanent under-secretary, who receives \$10,000 per annum; by a parliamentary under-secretary, a financial secretary, and other officials. The heads of the different army departments, both military and civil, are responsible to him. The commander-in-chief has command of all troops, and is responsible for their discipline and efficiency, he is the chief adviser of the secretary of state; has to prepare schemes of offense and defense, and recommends officers for promotion, appointments, and honors or rewards. The chief secretary alone is responsible to Parliament.

War of the Pacific, a name given to the war between Chile and Bolivia and Peru in 1879-83. See BOLIVIA; CHILE; PERU.

War Paint, among the American Indians, paint put on the face and other parts of the body on going to war, with the object of making their appearance more terrible to their enemies.

War Path, among the American Indians, the route or path taken on going to war; a warlike expedition or excursion. On the warpath, means on a hostile or warlike expedition; hence, colloquially, about to make an attack on an adversary or measure.

War Tariff, a general name applied to various tariff measures passed by Congress during the Civil War. These bills included a bill raising the tariff of 1857 about one-third, passed 2 March 1861; amended tariff act raising duties passed 5 Aug. 1861; act increasing tariff

on tea, coffee and sugar, passed 24 Dec. 1861; act raising tariff duties temporarily, passed 14 July 1862; act raising all duties 50 per cent for 90 days, passed 29 April 1864; general revision of tariff, increasing duties, passed 30 June 1864. See U. S.—TARIFF IN THE.

War Tokens. See **TOKEN MONEY.**

Warbeck, wār'bēk, Perkin, a pretender to the throne of England in the reign of Henry VII.: b. Tournay about 1475; d. London 28 Nov. 1499. He was the son of a Jew of Tournay and appears in history in 1499, when he was attached to the court of Margaret, dowager duchess of Burgundy. At this court he was taught to represent Richard, duke of York, younger brother of Edward V., one of the princes generally supposed to have been murdered by their uncle Richard of Gloster in the tower. In 1492, when there was prospect of a war between France and England, Warbeck landed at Cork, and was joined by numerous partisans. At the invitation of Charles VIII. he went to the court of France, where he was acknowledged as duke of York, received a pension, and was attended by a body guard. At the peace of Estaples he was dismissed from France and went to Flanders, where he was received by the duchess of Burgundy as her nephew. The belief in the truth of his claim was shared by the populace of England, and certain of the nobility, and some of them openly declared for him. He was, however, taken prisoner after an invasion of Cornwall 1497, tried for high treason and hanged at Tyburn.

Warblers, a popular name applied in different countries to a variety of small insectivorous birds belonging to quite distinct families, but resembling one another in habits and appearance. The American warblers, to which the book name "wood-warblers" is often given, belong to the extensive family *Mniotiltidae* and include a varied assemblage of generic types somewhat closely related to the tanagers (*Tamniptidae*). They are small birds, with one or two exceptions about five inches in length. Their colors are bright and varied, yellows often predominating, with patches of red, blue, brown, black or white in conspicuous places; but the females are often plain and often closely resemble one another in the different species. The bill varies, but is generally rather slender, pointed, slightly curved and without a hooked tip, a tooth, or a deep notch; the feet are rather small with scutellate tarsi and present no positive characters; the primary wing-quills are 9, the secondaries are not elongated and the tail-quills are 12 in number. Owing to the great diversity of the genera it is practically impossible to give any brief definition covering all. Various groupings of the genera into sub-families have been proposed, but with the exception of the well marked *Icterinae*, which are decidedly aberrant, they all intergrade more or less easily. A division such as follows, is convenient and fairly natural. The typical warblers (*Sylviolinae*) have the wings nearly always longer than the tail, the bill slender and conical, with the commissure slightly curved and the rictal bristles short or wanting. The fly-catching warblers or (*Setophaginae*) have similar wings and tail, with the bill broad and flattened at the base, the commissure slightly curved, and the

rictal bristles numerous and very long. The chats (*Icteriae*) have the wings shorter than the tail, the bill high, compressed and stout, with strongly curved commissure and no rictal bristles. They are much larger than any of the members of the other subfamilies.

There are, in round numbers, about 130 species of known warblers, strictly confined to America; the flycatching warblers being found in greatest variety and abundance in northern South America, Central America and the West Indies, while the *Sylviolinae* are pre-eminently characteristic of North America. Warblers are all insectivorous and migratory, chiefly inhabitants of the woods and thickets, and because of their varied habits and great abundance among the most interesting of our birds. They build on the ground, in bushes, in crevices or high up in tall trees, nests exhibiting a great diversity in material and architecture. The name warbler probably alludes to their constancy rather than to their ability as musicians, for their songs, though attractive and interesting, are, with a few exceptions, not highly melodious. The varied role played by warblers in nature has been well expressed by Dr. Coues in the following poetic passage: "The warblers have we always with us, all in their own good time; they come out of the South, pass on, return, and are away again, their appearance and withdrawal scarcely less than a mystery, many stay with us all summer long, and some brave the winters in our midst. Some of these slight creatures, guided by unerring instinct, travel true to the meridian in the hours of darkness, slipping past 'like a thief in the night,' stopping at daybreak from their lofty flights to rest and recruit for the next stage of the journey. Others pass more leisurely from tree to tree, in a ceaseless tide of migration, gleaming as they go; the hardier males, in full song and plumage, lead the way for the weaker females and yearlings. With tireless industry do the warblers befriend the human race; their unconscious zeal plays due part in the nice adjustment of Nature's forces, helping to bring about that balance of vegetable and insect life without which agriculture would be in vain. They visit the orchard when the apple and pear, the peach, plum and cherry are in bloom, seeming to revel carelessly amid the sweet-scented and deliciously tinted blossoms, but never faltering in their good work. They peer into the crevices of the bark, scrutinize each leaf, and explore the very heart of the buds, to detect, drag forth and destroy those tiny creatures, singly insignificant, collectively a scourge, which prey upon the hopes of the fruit-grower, and which, if undisturbed, would bring his care to naught. Some warblers flit incessantly in the terminal foliage of the tallest trees; others hug close to the scored trunks and gnarled boughs of the forest kings; some peep from the thicket, the coppice, the impenetrable mantle of shrubbery that decks tiny water courses, playing hide-and-seek with all comers; others, more humble still, descend to the ground, where they glide with pretty mincing steps and affected turning of the head this way and that, their delicate flesh-tinted feet just stirring the layer of withered leaves with which a past season carpeted the ground. We seek warblers everywhere in their season; we shall find them a continual surprise."

WARBLERS

Of the Sylvicolinae 9 genera and 46 species are North American, the principal genera being *Dendroica*, the largest by far, *Helminthophila* and *Geothlypis*. The diagnostic colors of many are sufficiently indicated by their vernacular names, which, however, are generally descriptive of the full-plumaged males only. The black and white creeping warbler (*Mniotilta varia*) has the sexes similarly colored and is a common migratory woodland species throughout eastern North America, breeding from Virginia northward and wintering from the Gulf coast into South America. In feeding habits it resembles the brown creeper rather than the other warblers, climbing the tree trunks and larger branches by clinging to the bark, searching the crevices for insects and their eggs, but not using the tail as a prop. The song is a feeble unmusical trill, but the call notes are varied. A simple nest on the ground of bark, moss, grass, etc., contains 4 or 5 eggs, white with profuse reddish brown spots. *Protonotaria* includes only *P. citrea*, the prothonotary warbler, a beautiful species whose prevailing color in both sexes is golden with olivaceous and bluish above and the tail-quills largely white; the bill is unusually long, acute and black. It breeds in most of the United States east of Nebraska, but is rare in the east north of Virginia. It haunts swampy woods and thickets and nests in holes of trees. An interesting species of striking aspect is the worm-eating warbler (*Helminthorus vermivorus*), with a stout acute bill without bristles, a very short tail and strong feet. In both sexes the back is olivaceous, the under parts buff, and the head conspicuously marked with four longitudinal black stripes. A common bird of the eastern United States west to Nebraska and north to southern New England, breeding over this range and wintering in the Antilles and northern South America. It is a bird of the woodland undergrowth and nests on the ground, the 4 or 5 eggs being brilliant white with fine dots of reddish brown. The popular name is a misnomer as it does not feed on worms but chiefly on caterpillars and spiders. The best known of the *Helminthophila* is the blue-winged yellow warbler (*H. pinus*) having about the limits of range of the last and much resembling it in habits though they are more active and arboreal and often frequent the shrubbery of parks and well-kept grounds. The Nashville warbler (*H. ruficapilla*) is a plain species; the males in breeding dress olive above, yellow below, the latter remaining even in the duller autumn colors and the female. Except in the extreme northern States this species is a migrant only, but very common in the United States, breeds in the British provinces and winters in Mexico and Central America. This genus also includes the golden-winged, Tennessee, and orange-crowned warblers of the eastern United States, and several western species, besides some rarities which are supposed to be hybrids. No warbler is better known than the little gaily-dressed parula or blue yellow-backed warbler (*Geothlypis americana*) which breeds in the United States and lower Canada west to the great plains and winters in the West Indies and Central America. They are very common in open woods during the migrations and distributed more locally in swampy districts and river valleys during the breeding

period, probably attracted by the abundance of the long stemmed *Usses* or "Spanish moss," of which their beautiful, usually globular hanging nests, are in chief part constructed. Like the *Dendroica* they are true tree-warblers, incessantly flitting about the outermost twigs, turning and hanging in every conceivable attitude and often taking short flights in pursuit of flying insects.

Dendroica comprises 24 species of the warblers found within our limits. Most of them glean for their food in the terminal twigs of trees much as does the parula, and like it their songs are simple feeble trills. They come in troops when the forest trees are bursting into leaf in May and most of them pass to the British provinces or at least to the northern woods and high mountain ridges to breed, but a few, like the yellow warbler, remain through the summer. With few exceptions they never nest on the ground. The males in breeding plumage are handsomely and variously colored, but nearly always have much white on the tail quills, the female, young and male autumn plumage is generally very different. One of the best-known but hardly a good representative example is the yellow or summer warbler (*D. aestiva*), one of the few species which has an extensive breeding range in the United States. It is abundant almost everywhere in North America and its warm glowing yellow color and the absence of white from the tail are diagnostic. It is less of a woodland bird than many of the others and frequents orchards, parks and roadside thickets, building a pretty nest, compactly felted of soft vegetable fibres, bits of wool, paper, etc., securely wedged in the upright fork of a bush or low tree. More than one brood of 4 or 5 young is sometimes raised and these birds often outwit the cowbird which drops an egg in their nests by covering the intruder with a false floor and hatching their own brood above it. The spring song of the yellow warbler is very sprightly. Other species which breed over considerable areas in the United States are the cerulean warbler (*D. cerulea*), chestnut-sided warbler (*D. pennsylvanica*), yellow-throated warbler (*D. dominica*), pine warbler (*D. vigorsii*), and prairie warbler (*D. discolor*) in the east, and the black-throated gray warbler (*D. nigrescens*), Townsend's warbler (*D. townsendi*), hermit warbler (*D. occidentalis*) and golden-cheeked warbler (*D. chrysoparia*) in the west. Well-known migrant species, which breed in Canada and more or less in our northern border States and along the high mountain ridge southward even to North Carolina and Georgia, are the Cape May warbler (*D. tigrina*), black-throated blue warbler (*D. caerulescens*), yellow-rumped or myrtle warbler (*D. coronata*), which lingers into the winter even in the latitude of Philadelphia, magnolia warbler (*D. maculosa*), bay-breasted warbler (*D. castanea*), the beautiful black and orange Blackburn's warbler (*D. blackburni*), black-throated green warbler (*D. virens*), and the eastern palm warbler (*D. palmarum hypochrysea*).

Very distinct in appearance from all of the above are the members of the genus *Seturus*, of ground-loving habits and thrush-like plumage, brownish above and streaked or spotted below. We have three species. The golden-crowned thrush or oven-bird (*S. auricapillus*) slightly exceeds six inches in length, and both sexes

WARBLERS

are of a rather bright olive color above, with a golden crown-streak bounded by black. It inhabits the greater part of North America and breeds from Virginia and Kansas northward, building its over-arched nest of leaves and grasses on the ground and laying therein 4 to 6 white eggs thickly speckled with brown and lilac. The oven-bird is very common in the summer in the New England and Middle States, inhabiting low damp woods and living mostly on or near the ground, searching for its chiefly insect food among the fallen leaves. Besides its ordinary loud clear whistled song, it has an exquisitely sweet nuptial song seldom heard. The common water-thrush or water-wagtail (*S. noveboracensis*) is slightly smaller and of a nearly uniform rich olive-brown above, pale yellow, streaked with brown below. Its breeding range is northerly in the eastern United States to Illinois, and to the Arctic, and it winters in middle America. The water-thrush inhabits woodlands in the vicinity of streams and swamps and resembles the wagtails in its habit of wading and raising the tail to balance the body on its insecure footing. The nest of leaves, grasses and fine roots is built on the ground in the shelter of a log and the crystalline white eggs profusely speckled with brown number 4 to 6. A related species of similar habits, the large-billed or Louisiana water-thrush (*S. motorilla*), is more southern in range but very similar in appearance. Both are exquisite songsters.

Geothlypis contains a group of ground-warblers with the feet stout and the wings generally very short and exceeded in length by the tail. A typical very common, and wide ranging species is the Maryland yellow-throat (*G. trichas*) which breeds from Georgia to Labrador. The male is a handsome bird, olive above, chiefly clear yellow below, the face with a broad rich black mask which the female lacks. It lives in thickets and shrubbery, especially where the ground is low and wet. The nest is skilfully concealed in tufts of herbage on the ground and is constructed of leaves, twigs, grass, rootlets, etc. The 4 to 6 eggs are white and rather sparingly spotted about the large end with brown. The song is a loud, clear, lively whistle sung with great energy. A related species is the Kentucky warbler (*G. formosa*), which differs in having in place of the black mask a black crown and a black bar running obliquely downward and backward from the eye and between them a yellow superciliary stripe. It is more southern than the yellow-throat, but breeds throughout the eastern United States. Much less common than the yellow-throat its habits are essentially similar, but it is a bird more of the woodland borders and underbrush than of the swampy thickets. Other species are the mourning warbler (*G. philadelphia*), the Connecticut warbler (*G. agilis*), and several southern and western species closely similar to the Maryland yellow-throat.

Coming now to the *Setophagina*, we find five genera and 10 species recorded as North American, six of which are Mexican and scarcely or not at all cross the borders of the United States. The remaining four are generally common eastern birds. Typical of the subfamily is the redstart (*Setophaga ruticilla*), not at all related to the redstart of Europe. The male is a handsome bird of lustrous black plumage, the belly white, and the wing lining,

a patch on the primaries and one on each side of the tail quills of rich orange which appears and disappears as the bird opens and closes these parts in its never ceasing activity in the pursuit of insects among the outer foliage of trees and the surrounding air. As a catcher of flying insects the redstart is very skilful; its song is lively and pleasing and its nest a neatly felted cup of soft vegetable fibres in an upright fork of a small tree. It is found throughout most of North America and breeds in the northern half of the United States and in Canada. The Canadian fly-catching warbler (*Sylvania canadensis*) is bluish ash above, rich yellow below, with numerous small black streaks on the crown and more distinct ones on the throat, and a black band running backward from the eye. This handsome species is found from the base of the Rocky Mountains eastward and breeds from southern New England and New York to Newfoundland. It is abundant during the migrations and spends much of its time making short flights to secure passing insects, from which it immediately returns to its unending activity in the higher branches of the trees. The nest is on the ground and the eggs of the usual warbler type. Two related species are the hooded warbler (*S. mitrata*) and the black-capped warbler (*S. pusilla*), both chiefly yellow, the first with a black cap and throat and a rich yellow face mask, the last smaller and with the black confined to the crown. The hooded warbler is chiefly southerly and hardly reaches the northern limits of the United States, but breeds southward to the Gulf coast, building its nest in low bushes. The black-cap, on the other hand, is even more northerly and has a wider western range than the Canadian warbler, but like it nests on the ground.

Of the *Icteriinae* our fauna contains but a single genus and species, the yellow-breasted chat (*Icteria virens*), isolated in structure and standing quite apart from the other warblers; and in manners equally unique. The length is about $7\frac{1}{4}$ inches, the color clear olive-green above; the throat, breast and sides bright rich yellow; the belly, superciliary and maxillary stripes and a spot below the eye, white; the cheeks and lores black, and the bill blue-black. The form is stout and the wings much shorter than the tail. In two subspecies the yellow-breasted chat inhabits the entire United States except the northern tier. It is locally abundant, living in tangled thickets on warm hillsides and sheltered valleys, and building a loose but pretty nest of leaves, plant stems, strips of bark and grass in the thickest patches of briars, often in association with many of its fellows. The eggs, which are about an inch long by four fifths of an inch in diameter, are usually 3 or 4 in number, variously spotted and blotched with brown and lilac. The chats are among the most remarkable of our songsters, but have no definite song, producing a constant succession of extraordinary sounds with much force and expression. Some are clear whistles endlessly modulated and combined, some are hoarse guttural notes, some sharp coughing sounds, some cat-like mews, some are original, others imitated, but all are uttered with a vehemence and abandon that is quite inimitable. Few birds surpass the chat in imitative or ventriloquistic powers and few combine their nuptial song, which is heard both

WARBLER — WARD

by night and day, with such a series of grotesque aerial antics.

The warblers of Europe belong to the family *Sylviidae*, related to the thrushes and by many ornithologists combined with these and other birds in the family *Turdidae* used in a wide sense. The *Sylviidae* have the bill of moderate length and slender form, broad at the base and tapering towards the extremity. The tip of the upper mandible is curved downwards, and is slightly notched. The wings are elongated with ten primaries and the tail has often only ten quills, the tarsi long and slender. The family includes a variety of sub-families and a large number of genera, presenting quite as varied an array of structures and habits as do the *Mniotiltidae* and quite as difficult to classify. All are small insectivorous and mostly plain-colored birds. They are especially characteristic of Eurasia, though some breed in Australia, New Zealand and the Polynesian Islands. *Regulus* and *Phylloscopus* inhabit North America. To this group belongs the genus *Sylvia*, represented by such forms as the white-throat (*Sylvia undata*), garden warbler (*S. hortensis*), chiff-chaff (*S. rufo*), and other equally notable species elsewhere described.

Besides an Asiatic species (*Phylloscopus borealis*) which extends its breeding range into Alaska the only North American representatives of this very extensive family are four species of *Regulus*, diminutive little birds known as kinglets (q.v.). The dainty little gnatcatchers (q.v.) of which three species are North American, and which with their allies form the family *Polioptilidae*, are very closely related to the *Sylviidae*. Some of the flycatching *Muscicapidae* are called warblers in Australia.

Warbler, in cattle. See-Ox-wor.

Warburton, wär'bér-tón, William, English prelate: b. Newark-upon-Trent, Nottinghamshire, 24 Dec. 1698; d. Gloucester 7 Jan. 1779. He studied law and practised in Newark, but soon gave up this profession and in 1723 took orders in the English Church, becoming rector of Brant Broughton, Lincolnshire, in 1728. In 1726 he formed an acquaintance with Theobald, to whose edition of Shakespeare he contributed. In 1727 he began to distinguish himself as an original writer by his inquiry into the 'Causes of Prodiges and Miracles,' and in 1736 appeared his 'Alliance between Church and State, or the Necessity and Equity of an Established Religion and Test Law.' The first volume of his chief work was published in 1737, entitled 'The Divine Legation of Moses demonstrated on the Principles of a Religious Deist from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dis-

pensation.' This paradoxical performance met with adversaries among all parties, who concurred in criticising and censuring the theory on which it is founded, and he replied to his critics in a vindication of his opinions. Having published in the journal called the 'Works of the Learned,' in 1739 and 1740, a defense of the 'Essay on Man' against the remarks of De Crousaz of Geneva, Pope acknowledged his obligations to Warburton, and an intimacy was established. On his death in 1744 Pope bequeathed to Warburton half his library, and the copyright of such of his works already printed as were not otherwise disposed of. In 1747 Warburton appeared as the editor of Shakespeare, and proved himself to be but a poor commentator. In 1750 appeared 'Julian, or a Discourse concerning the Earthquake and Fiery Eruption which defeated that Emperor's Attempt to rebuild the Temple, elicited by Middleton's Inquiry concerning the Miraculous Powers of the Christian Church.' In 1757 he became dean of Bristol, and two years after bishop of Gloucester. In 1768 he established a lecture at Lincoln's Inn on the evidence in favor of Christianity from the prophecies of the Old and New Testaments. His collected works were published by Hurd in 1788. Consult the biography of Watson (1863); and Mark Pattison, 'Essays' (1889).

Ward, wärd, Adolphus William, English historian: b. Hampstead 2 Dec. 1837. He was graduated from Peterhouse College, Cambridge, and became a fellow of his college. In 1866 he was appointed professor of history and English literature in Owens College, Manchester, an institution of which he was principal from 1888 till his resignation in 1897. He took a leading part in the movement for the foundation of Victoria University, and in 1900 became master of Peterhouse. He published a translation of Curtius' 'History of Greece' (1868-73), and in 1875 his valuable 'History of English Dramatic Literature to the Death of Queen Anne' appeared (new ed. 1899). Among his other works are: 'The House of Austria in the Thirty Years' War' (1869); 'Chaucer' (1880), and 'Dickens' (1882) in 'English Men of Letters' series; 'The Counter-Reformation' (1888); 'Sir Henry Wotton' (1897); 'Great Britain and Hanover' (1899); and numerous contributions to the 'Encyclopædia Britannica' and the 'Dictionary of National Biography.'

Ward, Artemas, American general: b. Shrewsbury, Mass., 1727; d. there 28 Oct. 1800. He was graduated at Harvard College in 1748; early entered public life as a representative to the general court; became a member of the executive council and a justice of the court of common pleas of Worcester County. In the French and Indian War he served as lieutenant-colonel under Abercrombie and at the opening of the Revolutionary War was in command of the besieging forces at Boston till the arrival of Washington, after which he was stationed with the right wing on Roxbury Heights. He resigned his commission of major-general, in April 1776, but at the request of Washington continued to serve till the end of May. He was president of the Massachusetts executive council in 1777, a member of the legislature for 16 years, and sat in Congress 1780-1 and 1791-2.

WARD

Ward, Artemus. See **BROWN, CHARLES FARRAR.**

Ward, Edgar Melville; b. Urbana, Ohio, 24 Feb. 1839. He was graduated at Miami University; proceeded to study art at the National Academy of New York 1870-1 and subsequently spent six years in France (1872-8). He is a favorite genre painter and among his pictures are: 'The Sabot Maker'; 'Brittany Wash-woman'; and 'The Quilting Party.' He has been a National Academician since 1883 and subsequently was elected professor in the National Academy.

Ward, Edward Matthew, English painter: b. Pimlico, London, 14 July 1816; d. Slough 15 Jan. 1879. His first studies were pursued in the studio of John Cawse, London, and in 1835 he entered the Royal Academy schools. During the three years 1836-9 he was in Paris, Venice and Rome; and studied fresco-painting with Cornelius at Munich. His first noteworthy picture was 'Cimabue and Giotto,' exhibited at the Royal Academy (1839). From that time he was a regular contributor to the Academy's annual exhibition, and in 1855 was elected academician. In 1853 he was commissioned to paint eight pictures for the corridor of the House of Commons, their subjects being: 'The Execution of Montrose'; 'The Last Sleep of Argyll'; 'Alice Lisle concealing Fugitives'; 'Monk declaring for a Free Parliament'; 'The Escape of Charles II. with Jane Lane'; 'The Landing of Charles II.'; 'The Acquittal of the Seven Bishops'; and 'William and Mary receiving the Lords and Commons.' He died from the effects of a self-inflicted wound. His numerous oil paintings were historical and genre, and among the best of them are: 'Dr. Johnson reading the Manuscript of the Vicar of Wakefield' (1843); 'A Scene from the Early Life of Goldsmith' (1844); 'A Scene in Lord Chesterfield's Ante-room in 1748' (1845), now in the Tate Gallery; 'Charles II. and Nell Gwyn' (1848), in the South Kensington Museum; 'The Royal Family of France in the Temple' (1851); 'Charlotte Corday going to Execution' (1852); the 'Ante-chamber at Whitehall during the Dying Moments of Charles II.' (1861); 'Hogarth's Studio, 1739' (1863); 'Luther's First Study of the Bible' (1869), now owned by the British and Foreign Bible Society; 'The Eve of Saint Bartholomew' (1873); 'Marie Antoinette in the Conciergerie' (1874); etc. Many of these are well known in engravings. Consult: Dafforne, 'Life and Works of E. W. Ward' (1879).

Ward, Elizabeth Stuart Phelps, American novelist and poet, daughter of Austin Phelps (q. v.): b. Andover, Mass., 31 Aug. 1844; d. Newton, Mass., 28 Jan. 1910. In 1868 she was married to H. D. Ward (q. v.), with whom she has sometimes collaborated. Her first work to attract attention was 'The Gates Ajar' (1868), which had a very wide reading and was instrumental in substituting reasonable healthy views concerning a future existence in place of the vague and conventional ideas on the subject then prevalent in religious circles. Among her later works being: 'Men, Women, and Ghosts' (1869); 'The Silent Partner' (1870); 'Hedged in' (1870); 'The Story of Avis' (1877); 'Beyond the Gates' (1883); 'Dr. Zay' (1884); 'The Gates Between' (1887); 'Poetic Studies,' verse (1875); 'Songs of the

Silent World' (1884); 'The Struggle for Immortality' (1889), a volume of essays; 'A Singular Life' (1895); 'The Story of Jesus Christ' (1897). Her work is marked by originality as well as intensity of feeling and strength of moral purpose, but the note sounded is sometimes too shrill for the occasion.

Ward, Henry Augustus, American naturalist: b. Rochester, N. Y., 9 March 1834; d. Buffalo, N. Y., 4 July 1906. He was educated at Williams College, and at the Lawrence Scientific School at Harvard, where he was assistant to Prof. Agassiz. He studied in Paris and traveled through Europe and the Orient in 1855-9; occupied the chair of natural sciences at Rochester University in 1860-5, and in 1866-9 was manager of gold mines in Montana and South Carolina. He was engaged in traveling in various countries of the world in 1870-1900, collecting cabinets of mineralogy and geology, which he distributed among the colleges and universities of the United States. He founded at Rochester Ward's Natural Science Establishment, was naturalist to the United States expedition to Santo Domingo in 1871, and published 'Notices of the Megatherium Cuvieri'; and 'Description of the Most Celebrated Fossil Animals in the Royal Museum of Europe.'

Ward, Herbert Dickinson, American author, son of W. H. Ward (q. v.): b. Waltham, Mass., 30 June 1861. He was graduated from Amherst and in 1888 was married to Elizabeth Stuart Phelps (q. v.) with whom he wrote 'The Master of the Magicians' (1890); and 'Come Forth' (1890). Among works of which he is sole author are 'The New Senior at Andover'; 'The Burglar who Moved Paradise' (1897); 'The White Crown and Other Stories' (1894).

Ward, Mrs. Humphry. See **WARD, MARY AUGUSTA ARNOLD.**

Ward, James, English artist: b. London 23 Oct. 1769; d. Cheshunt, Hertfordshire, 23 Nov. 1859. He studied the engraver's art in his boyhood and also early turned his attention to painting, in which he was a pupil of Morland who married his sister. He was elected R.A. in 1811. His first painting was exhibited in 1790, and from that time to his death he produced numerous pictures of different types, though his best work was done in the painting of animals. His most important works are: 'Bull-baiting' (1797); The 'Alderney Bull, Cow, and Calf in a Meadow' (1820-2), his masterpiece, now in the National Gallery, painted in rivalry with Paul Potter's celebrated picture; 'Allegory of Waterloo' (1817), a sketch for the British Institution which he afterward painted larger with less success; 'Gordale Scar, Yorkshire,' in the National Gallery (this great picture with its noble group of cattle which was presented by Lord Ribblesdale to the British Museum with a view to its transference to the British Museum was rolled up and consigned to a cellar until 1858, though it eventually reached its destination in 1878); 'Harlech Castle,' also in the National Gallery; 'Regent's Park in 1807'; 'A Cattle Piece,' also in the National Gallery; 'Bulls Fighting in a Landscape,' a work of great merit, now in the South Kensington Museum; 'Donkey and Pigs,' also in the museum at South Kensington; 'Pigs,' and 'A Chinese Sow,' in the same collection;

WARD

'The Council of Herten,' in the Manchester Gallery; and 'De Tabley Park,' in the Oldham Gallery. Among his engravings the most noteworthy are after Rembrandt, Hoppner, Rubens, Northcote, Morland, and Reynolds. As an engraver he was not less successful than as a painter and a complete set of impressions of all his plates, in their different states, 300 in all, was presented by him to the British Museum before his death.

Ward, John Henry Hobart, American soldier: b. New York 17 June 1823; d. Monroe, N. Y., 25 July 1903. He entered the United States army in 1841, was appointed sergeant-major in 1845, served through the Mexican War, and was afterward successively assistant commissary-general and commissary-general of New York. He organized a regiment of volunteers at the outbreak of the Civil War, was appointed colonel, and was engaged at the first battle of Bull Run. He later participated in the Peninsular campaign, in the second battle of Bull Run, and on 4 Oct. 1862 was promoted brigadier-general of volunteers. He was subsequently engaged with the Army of the Potomac and was in command of a brigade at Fredericksburg, Chancellorsville, Gettysburg, the Wilderness, Spottsylvania, and other important battles. He was honorably mustered out of service 21 July 1864 and from 1870 until his death was clerk of the superior court of New York city.

Ward, John Quincy Adams, American sculptor: b. Urbana, Ohio, 20 June 1830. In 1850 he entered the studio of Henry K. Browne, where he studied six years. In 1861 he opened a studio in New York, where as the fruits of his residence in the Indian country, he modeled his 'Indian Hunter.' This was followed by 'The Good Samaritan,' 'Commodore M. C. Perry,' with reliefs and 'The Freedman.' Among his best known work in later years he produced the 'Citizen Soldier,' and statues of 'Shakespeare,' 'General Reynolds,' 'General Washington,' 'General Israel Putnam,' 'General Thomas,' 'General Daniel Morgan' and 'Lafayette.' He subsequently modeled the colossal statue of 'Washington' for the New York sub-treasury building, a colossal statue of 'President Garfield' and 'The Pilgrim.' The crowning group of 'Victory' in the arch for the Dewey reception in New York in 1899 was also his work. For three years he was vice-president, and for one term president of the National Academy of Design, and was trustee of the Metropolitan Museum of Art. Died: May, 1910.

Ward, Lester Frank, American geologist: b. Joliet, Ill., 18 June 1841. Graduated from Columbian University in 1869, he was assistant-geologist in the United States geological survey in 1881-8, and geologist in 1888. He made especial investigations in the field of paleobotany. Among his publications are: 'Guide to the Flora of Washington and Vicinity' (1881); 'Sketch of Paleobotany' (1885); 'Types of the Laramie Flora' (1887); 'Geographical Distribution of Fossil Plants' (1888); 'Outlines of Sociology' (1898); and 'Pure Sociology' (1903).

Ward, Lydia Avery Coonley, American writer: b. Lynchburg, Va., 31 Jan. 1845. She was married in 1869 to J. E. Coonley (d. 1882)

and in 1897 to H. A. Ward, and was president of the Chicago Woman's Club 1895-6. She has published 'Under the Pines and Other Verses' (1895); 'Our Flag,' a cantata, with music by G. F. Root (1896); 'Singing Verses for Children' (1897); 'Love Songs' (1898).

Ward, Mary Augusta Arnold, English novelist: b. Hobart, Tasmania, 11 June 1851. She is a daughter of Thomas Arnold (q.v.), second son of Dr. Thomas Arnold of Rugby and in 1872 was married to Thomas Humphry Ward. Her father, having become a Roman Catholic, gave up his educational post in Tasmania and returned to England in 1856 and there his daughter was educated. The father held appointments at Dublin and Birmingham, and after 1885 resided at Oxford, where she also lived with her husband till they removed to London in 1880. Her long residence in Oxford and consequent familiarity with the intellectual atmosphere of the university no doubt gave her that inclination toward ethical discussion which has so markedly influenced the character of her writing. In 1890 she was one of the principal founders of University Hall, a settlement among the poor in the Saint Pancras district of London, and since 1897 occupying a spacious building near Tavistock Square, erected for that purpose by Passmore Edwards. In the work of this settlement Mrs. Ward has put a vast amount of personal endeavor and thought, and its influence has been commensurate with the pains that have been taken in its behalf. Mrs. Ward's first important literary work was a translation of 'Amiel's Journal' (1885), but prior to this she had published 'Milly and Olly,' a child's story. These were followed by 'Miss Bretherton,' a story (1886); and 'Robert Elsmere' (1888), which brought her almost immediately a world wide fame, being translated into several languages, and having an immense sale. Later works of hers are 'The History of David Grieve' (1892); 'Marcella' (1894); 'Sir George Tressady' (1896); 'Helbeck of Bannisdale' (1898); 'Eleanor' (1900); 'Lady Rose's Daughter' (1902); 'The Marriage of William Ashe' (1905); 'Fenwick's Career' (1906). She has also published 'Unitarianism and the Future' (1894). All of Mrs. Ward's novels display much intellectual power and intensity of moral purpose, and her influence upon the social and ethical thought of the last 10 or 15 years in England and the United States has not been inconsiderable. Her novels are of varying degrees of excellence, 'Helbeck of Bannisdale' being perhaps the most powerfully conceived since 'Robert Elsmere.'

Ward, May Alden, American writer and lecturer: b. Cincinnati, Ohio, 1853. She was graduated from the Ohio Wesleyan University in 1873 and in 1873 was married to W. G. Ward (b. 1848) (q.v.). She has been president of the Massachusetts State Federation of Woman's Clubs from 1901, has lectured widely and is the author of 'Life of Dante' (1887); 'Petrarch: His Life and Works' (1891); 'Old Colony Days' (1896); 'Prophets of the 19th Century' (1900).

Ward, Nathaniel, English Puritan divine: b. Haverhill, Suffolk, 1576; d. Shenfield, Essex, 1652. He was educated at Emmanuel College, Cambridge, traveled widely on the Continent, took orders in 1618, and from 1620 to 1624

appears to have been chaplain to the colony of British merchants at Elbing, Prussia. On his return to England, he was curate of Saint James', Piccadilly (1626-8), and subsequently rector of Standon Massey, Essex. On account of his Puritan views he was frequently cited before Laud, who finally (1633) deprived him of the living. He emigrated in 1634 to Massachusetts, and became minister to a settlement at Agawam, later called Ipswich. This post, because of ill-health, he resigned in 1636. In 1639 he was appointed, with the Rev. John Cotton (q.v.), to frame the first code of laws for the colony,—the 'Body of Liberties,' passed by the general court in 1641. This compilation is in many respects a remarkable one, and displays wide knowledge of law. Ward was influential in the colonial government; in 1645 he became a member of the committee for the revision of the Massachusetts laws. But he is chiefly known as the author of the 'most eccentric and amusing' work written in colonial America. This book, 'The Simple Cobbler of Agawam,' was printed at London in 1647, and passed through four editions in that year. It appeared under the pseudonym of Theodore de la Guard—Theodore being the Greek equivalent of the Hebrew Nathaniel, de la Guard the French for Ward—who turns from his humble last to satirize England old and new. Amid some curious syntax, there is in it an abundance of eloquence and wit, making it still very readable. There is, too, much of the intolerance of the place and time. Ward went back to England in 1646. His 'Cobbler' had gained him some notice, and he preached before the Commons in 1647 and received the living of Shenfield, Essex, in 1648. Among his further publications were the sermon above noted (1647); 'A Religious Retreat Sounded to a Religious Army' (1647); 'To the High and Honorable Parliament, Humble Petitions, Serious Suggestions, and Dutiful Expostulations' (1650); and probably, 'Mercurius Anit-mechanicus' (1648), denouncing the execution of Charles. Consult: Dean, 'Memoir of Nathaniel Ward' (1868); Tyler, 'A History of American Literature' (1878); the 'Collection of the Massachusetts Historical Society, 3d ser., I, VIII; 4th ser. VII.

Ward, Susan Hayes, American author, sister of W. H. Ward (q.v.): b. Abington, Mass., 26 Nov. 1838. She was educated at Wheaton Seminary, Mass., under Lucy Larcom (q.v.), studied art in New York, Boston, Dresden, and Paris, and later studied at the Woman's Medical College in Boston. She afterward engaged in lecturing on art; was art-critic on the New York 'Independent' in 1883-93; and office editor in 1892-8. Her writings include: 'Christ at the Door' (1872); 'Sabrina Hackett'; 'History of the Broadway Tabernacle' (1901); 'George Hepworth,' a biography (1903); etc.

Ward, Thomas Humphry, English author and journalist: b. Hull 9 Nov. 1845. He was educated at Oxford, and was married to Mary Augusta Arnold, since widely known as Mrs. Humphry Ward, in 1872. He edited 'Ward's English Poets' (1881-2); 'English Art in the Public Galleries of London' (1888); 'The Reign of Queen Victoria' (1887); 'Men of the Reign' (1885); 'Men of the Time' 12th ed.

Ward, Wilfrid Philip, English author, son of W. G. Ward (q.v.): b. Ware, Hertfordshire, 2 Jan. 1856. He was educated at Ushaw College, Durham; and the Gregorian University at Rome, and was lecturer at the former in 1890. He has been a member of the Council of the Catholic Union of Great Britain since 1886, and has published 'The Wish to Believe' (1884); 'The Clothes of Religion' (1886); 'William George Ward and the Oxford Movement' (1889); 'William George Ward and the Catholic Revival' (1893); 'Witnesses to the Unseen' (1894); 'Life and Times of Cardinal Wiseman' (1897).

Ward, William, English Baptist missionary: b. Derby 20 Oct. 1769; d. Serampore, India, 7 March 1823. He was a printer who was licensed as a preacher and going to India in 1799 settled at Serampore. Besides printing various religious works in the Bengali language, he wrote 'An Account of the Writings, Religion and Manners of the Hindoos including Translation from their Principal Works' (1811, 5th ed. 1863), which was long the principal authority upon Indian affairs.

Ward, William G., American educator: b. Sandusky, Ohio, 5 Nov. 1848. He was graduated at Ohio Wesleyan University in 1872, studied theology at Drew Theological Seminary, was president of Spokane College in 1890-2, and professor of English literature at Syracuse University 1893-8. In the last named year he became professor of English literature at the Emerson College of Oratory, Boston, Mass. He has published 'Tennyson's Debt to Environment' (1898); 'The Poetry of Robert Browning' (1898); 'Art for Schools' (1899); 'Studies in Literature' (1901).

Ward, William George, English Tractarian leader and Roman Catholic theologian: b. London 21 March 1812; d. Hampstead, London, 6 July 1882. Educated at Winchester College, he entered Christ Church, Oxford, in 1830, obtained a scholarship at Lincoln College in 1833, was graduated in 1834, and about the same time secured election to a fellowship at Balliol. He then took orders, and was a lecturer in mathematics and logic. He soon became a powerful influence in Oxford life, especially on its religious side, among those more or less affected by him being Archbishop Tait, Benjamin Jowett, Dean Stanley, and the poet Clough. He in turn was profoundly influenced by John Henry Newman, whose famous 'Tract 90' he defended in two pamphlets. The publication, in 1843, of William Palmer's 'Narrative of Events connected with the Publication of Tracts for the Times' produced from Ward in reply his famous work 'The Ideal of a Christian Church considered in comparison with existing Practice' (1844), and the formal condemnation of this book by the university authorities precipitated Ward's reception into the Roman Catholic Church (1845), where he was soon followed by Newman and other Tractarians. In 1851 he became lecturer in moral philosophy in Saint Edmund's College, Ware, and in 1854 the pope gave him the diploma of Ph.D. He resigned his lectureship in 1858, and in the 'Dublin Review,' which he edited 1863-78, contended vigorously on behalf of ultramontane principles. He was founder and leading member of the

Metaphysical Society (1869) which included such opposites as Huxley and Martineau. In addition to the works already mentioned Ward wrote: 'On Nature and Grace' (1860); 'Essays on the Philosophy of Theism' (1884), a work of great ability; and many smaller works. Consult: 'William George Ward and the Oxford Movement' (1889); and 'W. G. Ward and the Catholic Revival' (1893), both by his son Wilfrid. See OXFORD MOVEMENT.

Ward, William Hayes, American Congregational clergyman and Orientalist: b. Abington, Mass., 25 June 1835. He was graduated from Amherst in 1856, from the Theological Seminary there in 1859, and was ordained to the ministry in the last named year. He engaged in pastoral work and in teaching, and in 1860-8 he was pastor of the Congregational Church and professor of Latin at Ripon College. He joined the editorial staff of the New York 'Independent' in 1868 and since 1870 has been editor of that publication. He was in charge of the Wolfe exploring expedition to Babylonia in 1884, concerning which he published a 'Report' (1885); and has also written: 'World's Christmas Hymn' with his sister, S. H. Ward (1883); 'Biography of Sidney Lanier' (1885); etc.

Ward, wård, Frederick, American actor: b. Wardington, Oxfordshire, England, 23 Feb. 1851. He made his first stage appearance in 1867, acted in English cities until 1874, then came to the United States, and for three years was leading man at Booth's Theatre, New York. He afterward supported Edwin Booth and John McCullough, and since 1881 has starred as a tragedian, also lecturing often on Shakespearean and other subjects.

Warden, David Adams, American musician: b. London 1815; d. Philadelphia, Pa., 4 Feb. 1902. He came to the United States before the Civil War and was engaged as organist in various Episcopal churches. During the Civil War period he composed the music for many patriotic songs, among which were 'The Flag's Come Back to Tennessee' and 'All Quiet Along the Potomac.' Both words and music of 'Mother, Don't Weep for Your Boy' and 'Tell Me, Ye Winged Winds' were his and he was also author of a book of chants.

Warden, David Baillie, American scholar: b. Ireland 1788; d. Paris, France, 8 Oct. 1845. He came to the United States when very young, received a classical education, was graduated from the New York Medical College; and in 1804 he was appointed secretary of the United States legation at Paris. He subsequently became consul and continued in that office until his death. His 'Statistical, Political, and Historical Account of the United States of North America' (3 vols. 1819) was later published in both French and German, and his other writings include: 'Inquiry concerning the Intellectual and Moral Faculties and Literature of the Negroes' (1810); 'Recherches sur les antiquités de l'Amérique septentrionale' (1827); 'L'Art de vérifier les dates, chronologie historique de l'Amérique' (10 vols. 1826-44); 'Bibliotheca Americana' (1831); etc.

Warden, Florence. See JAMES, FLORENCE.

Warden, the title in the United States of certain public officers, such as game-wardens,

who enforce the game laws, port-wardens, who are harbor officers, and the wardens of prisons.

In the Protestant Episcopal Church the church-wardens are two parochial officers, chosen annually at the Easter vestries, one by the minister, and one by the parishioners. Their duties are to protect the church-building and its appurtenances, to superintend the ceremonies of divine worship, and generally to act as the legal representatives of the parish.

In England the heads of All Souls, Keble, Merton, Wadham, and New colleges at Oxford are known as wardens. The Lord Warden of the Cinque Ports is an official with merely nominal duties now, though he was formerly of much importance. Lord Wardens of the Marches were formerly appointed to keep the disturbed border counties of England in a state of defense against the Scotch.

Wardha, wūr'dā, or Wurdha, India, (1) the chief town of the district of the same name, Central Provinces, on the left bank of the Wardha River, 40 miles southwest of Nagpur and 471 east of Bombay. It was founded in 1866; as a junction station on the railway it has become a centre of the cotton trade. (2) The district, which was formed out of Nagpur in 1862, has an area of 2,401 square miles. The staple crops are millet, cotton, wheat, and rice. Here is produced the well-known Hinganghat cotton, which is exported to the amount of 25,000 bales a year. The breed of cattle is good, especially the trotting bullocks. A railway crosses the centre of the district. (3) The Wardha River rises in the Satpura hills, and flows southeast for 254 miles to join the Weingunga; the united stream, under the name of the Pranhita, ultimately falls into the Godavary at Sironcha.

Wardian Cases are boxes covered with tight-fitting frames of glass, under which plants are successfully raised that could not be grown in the vitiated atmosphere of some cities or dwellings. They were invented by N. B. Ward, a surgeon of London, in 1836. Plants have been successfully transported long distances packed in these cases.

Wardlaw, Elizabeth, Lady, Scottish poet: b. 1677; d. 1727. She was the daughter of Sir Charles Halkett, of Pittfirrane, and in 1696 married Sir Henry Wardlaw, of Pitreavie, near Dunfermline. Her ballad, 'Hardyknute, a Fragment,' was first published in 1719 as an antique, and after enlargement from 216 to 336 lines, had been several times reprinted, when Percy in the second edition of his 'Reliques,' revealed its authorship. To Lady Wardlaw has also been ascribed, 'Sir Patrick Spens,' 'The Douglas Tragedy,' and many more traditional Scotch ballads. This is highly improbable. 'Hardyknute,' says Sir Walter Scott, "was the first poem I ever learnt, the last I shall ever forget."

Wardlaw, Ralph, Scottish Congregational clergyman: b. Dalkeith 22 Dec. 1779; d. near Glasgow 17 Dec. 1853. He at first studied divinity with the view of becoming a minister of the Associate Secession Church, but having been led to change his views on the subject of ecclesiastical polity, he was settled in charge of a congregation in Glasgow, where he continued to officiate to the close of his life.

WARD'S ISLAND — WARE

In 1811 he was appointed professor of systematic theology in the Congregational seminary in Glasgow. Both as a lecturer and as a preacher his abilities were of the first order. Of his numerous publications may be cited: 'Discourses on the Socinian Controversy' (1814); 'Essays on Assurance of Faith, and Extent of the Atonement and Universal Pardon' (1830); 'Christian Ethics' (1832); 'National Church Establishments Examined' (1839); 'Lectures on Female Prostitution' (1842); 'Congregational Independency' (1847).

Ward's Island, an island in East River, lying northeast of the Borough of Manhattan, New York city, and forming the northern boundary of Hell Gate. It is roughly circular in shape, and includes about 200 acres. It is the property of the city of New York, and contains a State Insane Asylum, a home for invalid soldiers, a home for children, and the State Emigrant Hospital.

Ware, wär, Henry, American Unitarian divine: b. Sherburne, Mass., 1 April 1764; d. Cambridge, Mass., 12 July 1845. He was graduated at Harvard in 1785, for two years studied theology, and in 1787 became pastor of the First Church at Hingham, Mass., where he remained until 1805, and then accepted the Hollis professorship of divinity at Harvard. At this time Unitarian views were beginning to cause dissension in the New England churches, and the appointment of Ware, a leader of Unitarian thought, to this position in the college brought on a memorable controversy, in which he took a prominent part, particularly in his 'Letters Addressed to Trinitarians and Calvinists' (1820), in answer to the 'Letters to Unitarians' by Leonard Woods, a professor at the Andover Theological Seminary. Ware also published 'An Answer to Dr. Woods' Reply' (1822); 'A Postscript to an Answer,' etc. (1823); 'Foundation, Evidences, and Truth of Religion' (1842); and other writings. He resigned his professorship in 1840, but was at the head of the Harvard Divinity School from its establishment in 1826 until his death.

Ware, Henry, Jr., American Unitarian divine and author, son of Henry Ware (q.v.): b. at Hingham, Mass., 21 April 1794; d. Framingham, Mass., 22 Sept. 1843. He was graduated at Harvard in 1812; was instructor at Phillips Exeter Academy, 1812-14; studied theology at Harvard under his father, and in 1817 became minister of the Second Church, Boston. From 1830 to 1842 he was professor of pulpit eloquence and pastoral care in the Harvard Divinity School, and in 1819-22 was one of the editors of the 'Christian Disciple,' afterward the 'Christian Examiner,' an organ of Unitarian thought. He took an active part in the organization of the Unitarian movement. Among his writings are: 'Hints on Extemporaneous Preaching' (1824); 'On the Formation of the Christian Character' (1831); 'Life of the Saviour' (1832); 'Scenes and Characters Illustrating Christian Truth' (1837); various memoirs; and compositions in verse.

Ware, William, American Unitarian clergyman and author: b. Hingham, Mass., 3 Aug. 1797; d. Cambridge, Mass., 19 Feb. 1852. He was graduated at Harvard in 1816, studied theology under his father, Henry Ware (q.v.) at

Cambridge, held pastorates at Northboro, Mass., Brooklyn, Conn., and Burlington, Vt., and from 1821 to 1836 was minister of the First Unitarian Church, New York. He afterward preached for short periods at several other places, all near Boston, was proprietor and editor of the 'Christian Examiner' (1839-44), and published: 'Letters from Palmyra' (1837), first published in the 'Knickerbocker Magazine,' subsequently republished as 'Zenobia, or the Fall of Palmyra' (new ed. 1868); 'Probus, or Rome in the 3d Century' (1838), republished as 'Aurelian' (new ed. 1868); 'Julian, or Scenes in Judea' (1841); 'Sketches of European Capitals' (1851); 'Lectures on the Works and Genius of Washington Allston' (1852); and a 'Life of Nathaniel Bacon,' in Sparks' series. He edited 'American Unitarian Biography' (1850).

Ware, William Robert, American architect, son of Henry Ware, Jr. (q.v.): b. Cambridge, Mass., 27 May 1834. He was graduated at Harvard (1852) and at the Lawrence Scientific School (1856). He practised architecture at Boston (1860-81). In 1865 he was appointed professor of architecture in the Massachusetts Institute of Technology and since 1881 has filled the same chair in Columbia University. Among his writings are 'Modern Perspective': 'The American Vignola.'

Ware, Mass., town in Hampshire County; on the Ware River, and on the Boston & M., and the Boston & A. R.R.'s; nearly in the centre of the State, about 25 miles northeast of Springfield, and about the same distance west of Worcester. It was settled in 1673 by Jabez Olmstead, and on 25 Nov. 1761 was incorporated as a precinct, and in 1775 was made a town. The town has a general elevation of about 550 feet above sea-level. The waterworks are owned and operated by the town. The chief manufacturing establishments are cotton, woolen, and hosiery factories, shoe factories, and machine shops. The government census of 1900 gives the number of manufacturing establishments 100; the number of employees in manufactories, 2,777; the amount of wages paid annually, \$779,930; the total cost for material used during the year \$2,119,178; and the value of the products \$3,681,069. From 1900 to 1904 there has been considerable increase of industrial interests and the number of employees are now (1904) about 3,500. The surrounding farms and the nearby manufacturing villages contribute to Ware's industrial prosperity. There are seven churches, a public high school, established in 1850, public and parish graded schools, and a public library which contains about 12,000 volumes. There is one national and one savings bank; the national bank is capitalized for \$300,000 and has deposits amounting to \$321,730. The savings bank, a State institution, has deposits amounting to \$4,009,350 (1 Jan. 1904). The government is administered by means of town meetings, at which, by popular vote, the town officers are elected. Nearly one third the population are of foreign birth, chiefly French Canadians and Poles. Pop. (1890) 7,329; (1900) 8,263; (1910) 8,774. Consult Gay, 'Gazetteer of Hampshire County.'

R. E. CARVER,
Editor 'Ware River News'

WAREHAM—WARFIELD

Wareham, wăr'am, Mass. town in Plymouth County; on Buzzard's Bay, and on the New York, New Haven & Hartford Railroad; about 30 miles southeast of Boston and 15 miles northeast of New Bedford. It has steamer connections with many of the coast cities and towns. The town contains the villages of Wareham, East Wareham, West Wareham, South Wareham, and Onset. The chief industries are iron manufacturing, and the cultivation of cranberries. The town has five churches, one high school, elementary schools public and private, and a public library. There are two banks, one national, capitalized for \$100,000, and a savings bank with deposits amounting to \$878,470. Pop. (1890) 3451; (1900) 3432, (1910) 4102.

Warehouseman, in law, one who receives goods of any kind for the mere purpose of storage. He is a bailee, and, his contract with the owner being one for their mutual benefit, is held only to ordinary care and diligence; and if loss or injury happen to the goods, he is not responsible without the absence of this care or diligence on his part, unless he expressly assumes a greater responsibility. There is nothing, however, to prevent warehousemen receiving goods on whatever terms or contract they see fit to make with the owner. Persons may become warehousemen, and subject only to the law of that relation, whose general position is quite different. Forwarding merchants in the United States are generally regarded as warehousemen, unless they take upon themselves the duty and the responsibility of common carriers, which they do when they begin to act in that character. On the other hand, common carriers, as railroad companies or expressmen, lie only under the less responsibility of warehousemen when they cease to be carriers of the goods they have transported, or have not yet begun to carry those they have taken for future transport. It is sometimes difficult to draw the line in particular cases, and any whether a person or company is liable without fault because the goods were then in his or its possession as carrier, or liable only for fault because the transit had not begun, or had terminated. The general principle is quite certain, although the authorities are far from uniform in their application of it. If the carrier receives them to carry at once or as soon as he can, he holds them as carrier; if he is to keep them until a distant period of transit, until then he is only a warehouseman. If the actual transit have ceased, some courts hold that his liability ceases at once; and it undoubtedly does so when, after he is ready to deliver them, they are left on his hands and he awaits the call of the owner or consignee. A warehouseman has a lien on goods in his care for the storage of them. He may deliver a part and retain his lien on the residue for all his charge for all the goods, if all were delivered to him as one bailment. But he has no general lien on any goods for all demands against the owner, or for the storage of other goods.

Warehousing System, the system by which goods liable to excise or customs duty are kept in warehouses without the duty being paid on them till they pass to the consumer or the retail dealer. Goods liable to duty are warehoused in a bonded warehouse, and are called goods in bond. The ports at which par-

ticular kinds of goods may be warehoused are determined; but the system has been gradually relaxed so as to admit of every important port being used for warehousing, and even important inland towns are admitted as warehousing centres. The warehouse is kept by a bonded store-keeper, who gives a bond of sufficient value, and with satisfactory security to the government for the performance of his duties. When goods are warehoused by an importer in a bonded store they may be transferred by an order, addressed by the importer to the store-keeper, to any other person, the new owner assuming the responsibilities of the importer. Goods in a bonded store are always open to the inspection of the officers of customs, and can only be inspected by the owner in the presence of the proper officer. Any importer who fraudulently gains access to goods stored by him without the presence of the proper officer is liable to a penalty of \$500. Goods must be stored and remain in store in their original packages, unless when permission is given before or after storing to sort or repack them. Any infringement of this regulation, or of the regulations for storing or removing goods, subjects to heavy penalties, commonly to the forfeiture of the goods. Goods under bond may on application be removed at the expense of the owner as often as required from one warehouse to another, or by coast, or inland carriage, from one port to another, being stored on the same terms in the new port or warehouse as in the old. The warehouse-keeper is bound to store the goods so that easy access can be had to each package. The keeper of the warehouse is liable for the duty on any goods taken out of the warehouse without proper authority; but if goods are improperly removed by a customs-officer no duty is exigible. Goods which have been in warehouse for five years must be re-warehoused, or they will be liable to be sold.

Warfield, wăr'fēld, Benjamin Breckenridge, American educator: b. Lexington, Ky., 5 Nov. 1851. He was graduated from Princeton in 1871, from the Princeton Theological Seminary in 1876, and studied at the University of Leipzig in 1877. The next year he became instructor in New Testament literature and exegesis at the Western Theological Seminary, Allegheny, Pa. He was appointed professor of those branches in 1879, and in 1887 he resigned to accept the chair of didactic and polemical theology at Princeton, which he still occupies. He edited the 'Presbyterian and Reformed Review' in 1890-1902, and has written: 'The Divine Origin of the Bible' (1882); 'Augustine's Anti-Pelagian Treatise' (1887); 'The Right of Systematic Theology' (1897); 'Acts and Pastoral Epistles' (1902); 'The Power of God, Unto Salvation' (1903); etc. He is prominent as a conservative leader in his denomination.

Warfield, Ethelbert Dudley, American college president, brother of B. B. Warfield (q.v.): b. Lexington, Ky., 16 March 1861. He was graduated from Princeton in 1882 and from the Columbia Law School in 1885. In 1885-8 he was engaged in law practice at Lexington, but in 1888 accepted the chair of history and the presidency of Miami University, Oxford, Ohio, resigning in 1891 to accept a like position at Lafayette College, Easton, Pa., where he

WARHAM — WARM-BLOODED ANIMALS

still remains. He was ordained to the Presbyterian ministry in 1899 and has published: 'The Kentucky Resolutions of 1798' (1887); 'At the Evening Hour' (1898); 'Memoir of Joseph Cabell Breckenridge, U. S. N.' (1898); etc.

Warham, wâr'am, William, English prelate, archbishop of Canterbury: b. Hampshire about 1450; d. 23 Aug. 1532. He was educated at New College, Oxford, of which he became a fellow in 1475. He acted for a time as advocate in the Court of Arches and moderator of the civil law school at Oxford, and in 1493 was ordained subdeacon. He was granted the living of Barley, Herts, in 1495, and that of Cottenham, near Cambridge, in 1500, and held both till 1502, when he was consecrated bishop of London. He was formally installed as archbishop of Canterbury in 1504, and about the same time he was appointed lord-chancellor after 17 months' service as keeper of the great seal. From 1506 till his death he was chancellor of Oxford University. He performed the ceremony of coronation in 1509, after the accession of Henry VIII., and in 1515 was succeeded by Wolsey in the lord-chancellorship. When Wolsey had been raised to the dignity of papal legate there was much friction between him and Warham in their official capacities. Warham's action in regard to the divorce question was weak and subservient, but shortly before his death he made a protest against the acts of the parliament undermining the papal authority. In his earlier years he was much employed on foreign embassies. Consult: Campbell, 'Lives of the Lord-Chancellors' (1845-6); Hook, 'Lives of the Archbishops of Canterbury,' new series, Vol. I. (1868).

Waring, wâr'ing, George Edwin, American sanitary engineer: b. Poundridge, N. Y., 1 July 1833; d. New York 29 Oct. 1898. He was a pupil in agriculture of James J. Mapes, in 1853-5 lectured in Vermont and Maine on improved farming methods, and in 1855 was made by Horace Greeley manager of the latter's well-known experimental farm at Chappaqua, N. Y. In 1857-61 he was agricultural and drainage engineer of Central Park, New York, whose drainage system he planned. Having entered the Federal army in 1861 as major of the 39th New York volunteers (Garibaldi Hussars), he fought at the first Bull Run, was transferred to the Department of the Southwest, recruited a battalion of cavalry (Fremont Hussars) at St. Louis, and when these were consolidated with other troops to form the 4th Missouri cavalry, he was made colonel of that regiment. He served as such until mustered out of the service in 1865. In 1867-77 he was manager of the Ogden Farm, Newport, R. I., writing during that time the 'Ogden Farm Papers' for the 'American Agriculturist.' At the time of the yellow-fever epidemic in Memphis, Tenn., in 1878, he was appointed to alter the drainage system there; and subsequently he devoted himself to sanitary engineering. In 1882 he was appointed a member of the National Board of Health, with which he remained connected for several years; and in 1894 he became assistant-engineer of New Orleans. From 1895 to 1898 he was street-cleaning commissioner of New York; during his administration he thoroughly reorganized his department and brought it to a high state of efficiency. In 1898 he was

selected to be head of a commission for the improvement of sanitary conditions in Havana, Cuba, with the purpose of eradicating yellow fever. He prepared a detailed report of great value, but died of the fever not long after his return to the United States. He was a member of the Institution of Civil Engineers, Great Britain, fellow of the Sanitary Institute of Great Britain, honorary member of the Royal Institute of Engineers, Holland, and corresponding member of the American Institute of Architects. Among his published works are: 'The Elements of Agriculture' (1854); 'Whip and Spur' (1875); 'A Farmer's Vacation' (1876); 'Village Improvements and Farm Villages' (1877); 'Sewerage and Land Drainage' (1889); and 'Modern Methods of Sewage Disposal' (1894).

Wark, David, Canadian legislator: b. near Londonderry, Ireland, 19 Feb. 1804; d. Fredericton, N. B., 20 Aug. 1903. In 1825 he emigrated to New Brunswick, there took up shipbuilding, bookkeeping, and teaching until 1836, turned to mercantile life at Richibucto, later adding to his interests milling and lumber-trade. He held office as a county magistrate and judge of the court of common pleas, in 1842 was elected from the county (Kent) to the provincial legislature, and in 1846 re-elected. From 1851 to 1867 he was a representative of the county in the legislative council, being in 1858-62 in the executive council, and for a time holding the post of receiver-general. In 1867 he was one of the original senators appointed to the Senate of Canada under the British North America act. Throughout his political career he was identified with the Liberal party. In the development of agriculture, the extension of trade, and the promotion of education, he was prominently concerned. He undertook in 1847 the furtherance of legislation favoring reciprocal trade between the provinces, and such legislation eventually proved of influence in connection with the reciprocity treaty of 1854 between Canada and the United States. The perfected system of the New Brunswick savings bank was largely due to his initiative; and he was chiefly instrumental in bringing about the movement which in 1847 resulted in the constitution of the provincial board of education of New Brunswick, with the attendant changes, and in the reorganization of King's College as the University of New Brunswick (1859). His centenary was formally observed in 1904 by the presentation of addresses, it being claimed for him that he was the world's oldest legislator; and on 28 April a portrait of him by W. Forbes, A.R.C.A., was unveiled in the Senate. Consult an article by Crockett in the 'Westminster Magazine' (Toronto) for June 1903.

Warkamoo'wee, in Ceylon, the name of a canoe used with outriggers. It is generally manned by four or five Lascars, who sit grouped together for hours at the end of the lever, adding or taking away a man according to the strength of the wind. These canoes often sail 10 miles an hour.

Warm-blooded Animals, the name given to mammals and birds, in contradistinction to fishes, amphibians, and reptiles, and to all invertebrate animals. See ANIMAL HEAT.

WARMAN—WARNER

Warman, Cy, American journalist: b. Greenup, Ill., 22 June 1855. He engaged as a farmer and wheat broker in Illinois until 1880 when he removed to Colorado. He became editor of the 'Western Railway,' Denver, Colo., in 1888; of the Creede, Colo., 'Chronicle' in 1892; and in 1892 was introduced to the public as the 'Poet of the Rockies' by the New York Sun. He went to New York in 1893 and has since been engaged in literary work. He wrote the words of the popular song 'Sweet Marie' and has published: 'Tales of an Engineer' (1895); 'Snow on the Headlight' (1899); 'Short Rails' (1900); a volume of verse; etc.

Warming and Ventilation. See HEATING AND VENTILATION.

War'moth, Henry Clay, American politician and soldier: b. McLeansboro, Ill., 9 May 1842. He was admitted to the bar in 1861 and became district attorney of the 18th judicial district of Missouri in 1862, but resigned to enter the Union army. He was appointed lieutenant-colonel, was engaged in the assaults on Vicksburg of 19-22 May 1862, and was present at the battles of Lookout Mountain and Missionary Ridge. He served in the Texan campaign and was afterward judge of the military court of the Department of the Gulf until the close of the war. He became military governor of Louisiana in 1868 and was inaugurated civil governor upon the adoption of its new constitution, an office he occupied until 1873. He was a member of the Louisiana legislature in 1876-7 and collector of customs at New Orleans in 1889-93. He was one of the builders of the New Orleans, Fort Jackson & Grand Isle Railroad, of which he is president.

Warner, wār'nēr, Anna Bartlett ('AMY LOTHPROP'), American novelist, sister of Susan Warner (q.v.): b. New York 1820. She collaborated with her sister in writing the novels: 'Say and Seal' (1860); 'Wych Hazel' (1876); and 'The Gold of Chickaree' (1876). Her own publications include: 'Dollars and Cents' (2 vols., 1853); 'My Brother's Keeper' (1855); 'Stories of Vinegar Hill' (1871); 'The Fourth Watch' (1874); 'The Light of the Morning' (1882); 'Cross Corners' (1887); etc.

Warner, Beverley Ellison, American Protestant Episcopal clergyman: b. Jersey City, N. J., 14 Oct. 1855. He was educated at Princeton and Trinity colleges and at Berkeley Divinity School, Middletown, Conn., took orders in 1879, and is now rector of Trinity Church, New Orleans, La. He is author of 'Troubled Waters,' a novel (1885); and has also written: 'English History in Shakespeare's Plays' (1894); 'The Young Man in Modern Life' (1902); etc.

Warner, Charles Dudley, American editor and author: b. Plainfield, Hampshire County, Mass., 12 Sept. 1829; d. Hartford, Conn., 20 Oct. 1900. Graduated from Hamilton College in 1851 and from the law school of the University of Pennsylvania in 1856, he was admitted to the bar in the latter year at Philadelphia, and practised his profession at Chicago in 1856-60. In 1860 he became assistant editor of the Hartford (Conn.) *Evening Press*, and in 1861 its editor-in-chief. This newspaper was consolidated in 1867 with the *Courant*, a morning journal, and Warner was a part-owner and long

assistant editor of the latter, though eventually his connection with the paper was largely that of a literary contributor. Some letters of travel in America and Europe in 1868-9, printed in the *Courant*, were widely copied, and his articles published in book-form in 1870 as 'My Summer in a Garden,' placed him high in the list of American humorists. From 1884 to 1892 he was in charge of the 'Editor's Drawer' department of 'Harper's Magazine,' and in 1892 was transferred to that of the 'Editor's Study' in the same magazine. He was particularly successful in the essay, in which he combined shrewd observation and cultured humor in a manner in many ways resembling that of Washington Irving. He was a discerning critic as well; and in addition to his literary activities was identified with various philanthropic work. His further publications include: 'A Book of Eloquence' (1853); 'Saunterings' (1872); 'Backlog Studies' (1872); 'The Gilded Age' (with S. L. Clemens, 1873); 'Baddeck, and That Sort of Thing' (1874); 'Mummies and Moslems' (1876—reissued as 'My Winter on the Nile'); 'In the Levant' (1877); 'Being a Boy' (1877); 'In the Wilderness' (1878); 'The American Newspaper' (1879); 'Studies of Irving' (with W. C. Bryant and George P. Putnam, 1880); 'Life of Washington Irving' (1881); 'Captain John Smith, Sometime Governor of Virginia, and Admiral of New England: A Study of His Life and Writings' (1881); 'A Roundabout Journey' (1883); 'Papers on Penology' (with others, 1886); 'Their Pilgrimage' (1886); 'On Horseback: A Tour in Virginia, North Carolina, and Tennessee, Published with Notes of Travel in Mexico and California' (1888); 'Studies in the South and West, with Comments on Canada' (1889); 'A Little Journey in the World: A Novel' (1889); 'Looking Forward: The Dual Government Realized' (1890); 'Our Italy, Southern California' (1890); 'As We Were Saying' (1891); 'Washington Irving' (1892); 'The Work of Washington Irving' (1893); 'As We Go' (1893); 'The Golden House: A Novel' (1894); 'The Relation of Literature to Life' (1896); 'The People for Whom Shakespeare Wrote' (1897). He also edited the 'American Men of Letters' series and 'A Library of the World's Best Literature' (1896-8).

Warner, Olin Levi, American sculptor: b. Suffield, Conn., 9 April 1844; d. New York 14 Aug. 1896. He studied in the Ecole des Beaux Arts in Paris and subsequently entered Carpeaux's studio. In 1872 he opened a studio in New York, where his work came under the eye of several critics whose commendation secured his success. In 1877-8 he modeled 'Twilight,' which established his reputation. Among other well known works of his may be mentioned 'The Dancing Nymph'; 'Cupid and Psyche'; reliefs of Joseph and other Indian chiefs; statues of Governor Buckingham of Connecticut, William Lloyd Garrison, General Devens, etc.

Warner, Seth, American soldier: b. Roxbury, Conn., 17 May 1743; d. there 26 Dec. 1784. Having removed in 1763 to Bennington, he was prominent in the dispute between New York and the 'New Hampshire Grants' (afterward Vermont), and was outlawed (1771) with Ethan Allen (q.v.) and others. He took part

in the capture of Ticonderoga, and 12 May 1775 effected the surrender of Crown Point with its garrison and 113 cannon. On 16 Sept. 1775 he was made by Montgomery, in whose Canadian expedition he participated, colonel of a regiment of Green Mountain rangers, though the provincial congress of New York withheld his commission. On 5 July 1776 he was commissioned by Congress the colonel of a regiment formed in pursuance of a resolution passed on that day; and on 7 July 1777 was defeated by Fraser at the battle of Hubbardton (q.v.). At the battle of Bennington, 16 Aug. 1777, he arrived with his regiment in time to meet the enemy's reinforcement and secure a victory. In 1782 he withdrew from the service. Consult Chipman, 'The Life of Col. Seth Warner, with an Account of the Controversy between New York and Vermont from 1763 to 1775' (1858).

Warner, Susan, American author: b. New York 11 July 1819; d. Highland Falls, Orange County, N. Y., 17 March 1885. For a number of years she resided on Constitution Island in the Hudson River, opposite West Point. Her first essay in literature was a novel entitled 'The Wide, Wide World,' published in 1850 under the pseudonym of Elizabeth Wetherell. This book was in its day next to 'Uncle Tom's Cabin' the most successful work of fiction in America in point of sales, and was popular also in Europe. In cheaper editions it still finds readers. It was mediocre in style and unduly pietistic in its manner; and, says Richardson, "all literature cannot show so lachrymose a book." It was succeeded by 'Queechy' (1852), which had also a large circulation, and 'The Hills of the Shatemuc' (1856), containing many glimpses of American scenery. She was also the author of 'The Law and the Testimony' (1853), in which the texts proving the great doctrines of Christianity are brought together under their appropriate heads; 'The Old Helmet' (1863); 'Melbourne House' (1864), and other works.

Warning Coloration, in zoology. See COLORATION, PROTECTIVE.

Warora, or Wurora, India, a town in the district of Chanda, Central Provinces, on the left bank of the Wardha River, 46 miles southeast of Wardha. Here is one of the largest coal fields in the peninsula. A shaft passes through a coal seam 15½ feet thick at a depth of 176 feet, and a little lower through another seam 11 feet thick. The field is estimated to afford an output of 100,000 tons per annum for 100 years. A narrow gauge line connects Warora with Wardha station on the Great Indian Peninsula Railway.

Warp. See WEAVING.

Warping, in agriculture, a mode of fertilizing poor or barren land by means of artificial inundation from rivers which hold large quantities of earthy matter, or warp, in suspension. The operation, which consists in enclosing a body or sheet of water till the warp has deposited, can only be carried out on flat low-lying tracts which may be readily submerged.

Warrant, as a legal term, is used to denote various judicial writings which authorize officers of the court to act in aid of justice such as to make arrests, search or seizures, and has been defined as "an order in writing in the name

of the people signed by a magistrate commanding the arrest of the defendant." The power is conferred upon justices of the peace, judges, of certain courts, and corporation officers who are clothed with powers of justice of the peace. The warrant is addressed to a sheriff, constable, or other officer, commanding him to arrest the body of the person named and bring him before the magistrate or court to answer or be examined regarding some offense which he is charged with having committed; it is not issued without probable cause, and is secured on the complaint of a person who thinks that a public offense has been committed and who appears before the justice of the peace and requests that a warrant be issued. A warrant must give the name of the accused or sufficient data to establish his identity. It must state the offense in respect to which the magistrate has authority to issue the warrant. A return must be made by the officer of his doing under it, but as there is no set time for a return, a warrant remains in force until it is executed. There are various other forms of warrant, such as search warrant of commitment, death warrant, extradition warrant, dividend or interest warrant, land warrant, landlord's warrant, tax warrant, warrant in bankruptcy, and municipal warrants.

Warrant Officer, a rank in the navy divided into three classes—gunners, boatswains, and carpenters, the gunners taking precedence of the other two. Formerly, before ironclads superseded wooden ships, there was only one officer of this rank of each class carried on board even the largest ships. Now, in addition to the officer of each class appointed to carry out the special duties of gunner, boatswain, and carpenter on board every ship, there are usually three or four junior gunners or boatswains appointed to battleships and some of the larger of other classes of ships to perform what are called quarter-deck duties, in addition to which in many of the larger ships an extra gunner or boatswain is appointed for torpedo duties. See NAVY OF THE UNITED STATES.

War'ranty, as a legal term is used as a promise or covenant or an undertaking on the part of one person to answer for the statements made of the thing warranted to be as represented, and to indemnify against loss, in case of failure. There are two general classes, express and implied. An express warranty is one made expressly in given terms, such as, in insurance, to indicate that an undertaking on the part of the insured that certain alleged facts are as he represents them to be; in real estate, that the grantor has a legal title to the lands conveyed; in sales, that the seller assures the quality, or the title to the property sold. A warranty in a sale of personal property is a statement made at the time of, and as part of the sale, that the goods or article sold is as represented. A warranty is implied when the law derives it by implication or inference from the nature of the transaction. No particular form of words is necessary to create a warranty. It is the subject matter of a statement and the circumstances under which it is made that are considered rather than the form.

A warranty is not valid unless supported by a consideration. In case of a breach of warranty the vendee may sue for the purchase price

WARREN

or may claim damages, and is not bound to return the goods. Proof of a warranty in a written contract must be shown in writing. Oral warranty cannot be admitted as evidence to vary the terms of a written contract except where the warranty is an independent agreement and where the writing does not embrace the whole contract.

Warren, wôr'ên, Sir Charles, British general: b. Bangor 7 Feb. 1840. He received a military education at Sandhurst and Woolwich, joined the Royal Engineers in 1857, and in 1861-5 was engaged in a survey of Gibraltar. During the three years following 1867 he carried out exploring work in Palestine for the Palestine Exploration Fund, and in 1876 was a commissioner for settling the western boundary of the Orange Free State. He commanded the Diamond Fields Horse in the Kaffir war of 1878, and during the immediately succeeding Griqua and Bechuana campaigns was commander of the field force. He returned to England in 1880, and during the next four years was attached to the Chatham school of military engineering as instructor in surveying. He commanded the Bechuanaland expedition of 1884-5, and was in command at Suakim. From 1886 till his resignation in 1888 he was chief commissioner of the metropolitan police of London, and for five years from 1889 was in command of the troops in the Straits Settlements, with the temporary rank of major-general. He was commander of the Thames district 1895-8; commanded a division in the South African war of 1899-1902, and co-operated with Sir Redvers Buller in that attempt to relieve Ladysmith with which the occupation of Spion Kop is prominently associated. He was afterward appointed military governor of Griqualand West. He has published 'Underground Jerusalem' (1876); 'The Temple or the Tomb' (1880); and, with C. R. Conder, 'Jerusalem' (1884).

Warren, Francis Emroy, American legislator: b. Hinsdale, Mass., 20 June 1844. He served in the Civil War as a non-commissioned officer in 1862-5 and received a Congressional medal for gallant conduct at Fort Hudson. He removed to Wyoming in 1868, became active in politics, was a member and president of the council, mayor of Cheyenne, treasurer of the Territory, and in 1885-6 was governor. In 1889 he again became governor and upon Wyoming's admission to statehood in 1890 was elected first governor of the State; before the expiration of his term, however, he was elected to the United States Senate, and has been re-elected 1894, 1900, and 1907.

Warren, Frederick Morris, American philologist: b. Durham, Maine, 9 July 1839. He was graduated from Amherst in 1860 and engaged as instructor in modern languages at Johns Hopkins in 1886-91. In 1891-1901 he was professor of Romance languages at the Western Reserve University, and since 1901 has been professor of modern languages at Yale. He has published: 'A Primer of French Literature' (1889); 'History of the Novel Previous to the Seventeenth Century' (1895), etc.; and has also edited: 'Selections from Victor Hugo' (1893); 'French Prose of the Seventeenth Century' (1899); Lamartine's 'Graziella' (1900); and 'Racine' (1903); etc.

Warren, Gouverneur Kemble, American military officer: b. Cold Spring, N. Y., 8 Jan. 1830; d. Newport, R. I., 8 Aug. 1882. He was graduated from West Point in 1850, was assigned to the engineering corps, and until 1859 was engaged in making river and railway surveys between the Mississippi River and the Pacific Ocean. He was assistant professor of mathematics at West Point from 1859-61, when he became lieutenant-colonel and later colonel and captain of volunteers. For service at Gaines' Mills in 1862 he was promoted brigadier-general, and he became chief of topographical engineers in 1863, rising to chief of engineers in the Army of the Potomac in that year. He was on the staff of Gen. Meade at the battle of Gettysburg, where on 2 July he seized and held Little Round Top, the key to the Federal position. He was promoted major-general of volunteers in May 1863 and in 1864 assumed command of the Fifth corps in the Army of the Potomac. He was subsequently placed in command of the Department of the Mississippi and in 1865 was mustered out of the volunteer service as brevet brigadier-general of regulars. He continued in the army, engaged in various surveys, and in 1879 was promoted lieutenant-colonel. A statue was unveiled to his memory on Little Round Top, Gettysburg, 8 Aug. 1882. He published various reports and 'An Account of the 5th Army Corps at Five Forks' (1866).

Warren, Henry Kimball, American college president: b. Cresco, Iowa, 31 May 1858. He was graduated from Olivet College in 1882, was principal of the public schools of Mount Pleasant, Mich., 1882-3, and of those at Hannibal, Mo., 1883-9. He was president of Gates College, Nebraska, 1899-04, of Salt Lake College, Utah, 1894-5, and has been president of Yankton College, South Dakota, from 1895.

Warren, Henry White, American Methodist bishop: b. Williamsburg, Mass., 4 Jan. 1831. He was graduated from Wesleyan University in 1853 and in 1855 was admitted into the Methodist Conference. He was engaged for 15 years in various pastorates in Massachusetts; served in the Massachusetts house of representatives in 1861-2; was pastor of the Arch Street Church in Philadelphia in 1871-4, and in 1877-80, and in 1880 was elected bishop. He has traveled in almost all parts of the United States in the performance of his episcopal duties and visited Japan for inspecting the Methodist Church missions in 1888. He edited 'The Study' in 1896-1900, and has published: 'Sights and Insights' (1874); 'Recreations in Astronomy' (1879); 'The Bible in the World's Education' (1892); 'Among the Forces' (1898); etc.

Warren, James, American Revolutionary leader: b. Plymouth, Mass., 28 Sept. 1726; d. there 27 Nov. 1808. He was graduated at Harvard in 1745, and for several years was engaged in mercantile pursuits at Plymouth. He was elected a member of the general court from Plymouth in 1766, was uniform in his support of the rights of the colonies, and remained in that assembly until it was dissolved in 1774. In 1772 he took a leading part in the establishment of committees of correspondence for the different colonies, a measure generally adopted. He became president of the Massa-

WARREN

Massachusetts provincial congress in 1775, was paymaster to the Continental army while it was at Cambridge, after the adoption of the Massachusetts State constitution was for several years speaker of the House, and held also a seat in the navy board.

Warren, Sir John Borlase, English naval officer: b. Stapleford, Nottinghamshire, 1754; d. Greenwich 27 Feb. 1822. He entered the navy as midshipman and after serving in that capacity for some time studied at Emanuel College, Cambridge, and took his degree in 1776. In 1774 he entered parliament as member for Marlow, and in 1775 was created a baronet. In 1793, on the commencement of the war with France, he was appointed to the *Flora* frigate, and in 1795 commanded the expedition to Quiberon Bay to assist the insurrectionists of La Vendée, which was unsuccessful. On 11 Oct. 1798 he fell in with a French squadron off the coast of Ireland destined for the invasion of that country, and captured the *Hoche* line-of-battle ship and three frigates. For this he was subsequently made rear-admiral of the blue. He continued in the navy until the peace of Amiens, when he was made privy councillor and sent to Russia as ambassador extraordinary and minister plenipotentiary, and there managed some delicate negotiations with regard to the retention of Malta with great ability. On his return he again entered into service, subsequently became vice-admiral, and in 1812 received the chief command in North America and the West Indies. He is the supposed author of an anonymous work entitled '*A View of the Naval Force of Great Britain*' (8 vols., 1791).

Warren, John Byrne Leicester, 3d BARON DE TABLEY, English poet: b. Tabley House, Cheshire, 26 April 1835; d. Ryde, Isle of Wight, 22 Nov. 1895. He was educated at Eton and Oxford, was called to the bar, and after a short diplomatic experience, devoted himself to literature. His life was passed in retirement, although he was the personal friend of Tennyson, Browning, Gladstone, and other eminent men of his day. His poetry, which reveals many excellencies of style as well as depth of thought, appeals to the cultivated few, but not to the general public. His earliest work appeared with the signature "G. F. Preston" (1858-62), and later he used the pseudonym "William Lancaster." After 1873 his work appeared with his own name, John Leicester Warren. In 1893 he published '*Poems Dramatic and Lyrical by Lord De Tabley*,' which met with qualified success, and in 1895 a second series appeared. Among his other volumes of verse are '*Præterita*' (1870); '*Philoctetes*' (1867); '*Orestes*' (1868); '*Rehearsals*' (1870); and '*Searching the Net*' (1873). He also wrote two novels, '*A Screw Loose*' (1868); '*Ropes of Sand*' (1869).

Warren, Joseph, American patriot: b. Roxbury, Mass., 11 June 1741; d. Charlestown, Mass., 17 June 1775. He was graduated from Harvard in 1759, studied medicine with Dr. James Lloyd of Boston, entered the practice of his profession in 1764, and from the time of the Stamp Act (q.v.) (1765) contributed to the press. On the occasion of the Townshend revenue acts (see TOWNSHEND, CHARLES, 1725-67), imposing duties on paper, glass, painter's colors,

and tea, legalizing writs of assistance, and forming a board of customs, Warren printed in the Boston '*Gazette*' over the signature "A True Patriot," a letter which caused Governor Francis Bernard to attempt the prosecution of the publishers on the ground that the article tended to bring the royal government into contempt. The attorney-general began proceedings, but the grand-jury refused to find a bill. In 1770 Warren was one of the committee of safety appointed after the "Boston massacre" of 5 March, and in 1772 he pronounced the memorial oration at the anniversary of that event. With Samuel Adams (q.v.) and James Otis (q.v.) he was recorded in November 1772 as a member of the first committee of correspondence, and during the next two years busily co-operated with Adams. When the latter left Boston, 10 Aug. 1774, to attend the meeting of the Continental Congress at Philadelphia, Warren became the leading figure in Massachusetts political movements. When the towns of Suffolk County assembled in convention at Milton, 9 Sept. 1774, Warren read a set of resolutions, drawn up by himself and since known as the "Suffolk resolves," which declared that a king who has violated the chartered rights of subjects forfeits their allegiance; that the "Regulating act," which had deprived Massachusetts without a previous notice and without a hearing of most important rights and liberties, was null and void; and directed tax-collectors to refuse to pay the moneys collected to Gates' treasurer, warned Gates that if patriots were arrested for political reasons royal officers would be held as hostages, and counseled the towns to choose their own officers of militia. After the meeting of the Provincial Congress in October 1774, Warren was chairman of the committee of safety for collecting military stores and organizing a militia, and on 5 March 1775 delivered his second oration on the anniversary of the "massacre." He was unanimously elected president of the Provincial Congress at its Watertown meeting, 31 May, being thus made chief executive under the provisional government. On 14 June he was chosen second major-general of Massachusetts forces, and on 17 June went to Bunker (Breed's) Hill, where he told Putnam and Prescott that he had come to serve as a volunteer aide. At the final conflict near Prescott's redoubt he was shot and killed. Webster's apostrophe to him in the 'Bunker Hill Oration' as "the first great martyr in this great cause" is well known. The biography by Everett in Sparks' '*American Biography*,' Vol. X. (1838) has been superseded by that of Frothingham, '*Life and Times of Joseph Warren*' (1865).

Warren, Mercy Otis, American patriot: b. Barnstable, Mass., 25 Sept. 1728; d. Plymouth, Mass., 19 Oct. 1814. She was Mrs. James Warren (see WARREN, JAMES), and James Otis (q.v.) was a brother. An ardent patriot, she corresponded with the leaders of the Revolution, among them Samuel and John Adams, and Thomas Jefferson. She wrote some dramatic works which were included in her volume of '*Poems, Dramatic and Miscellaneous*' (1790). Of these attempts in drama the best is the metrical 'Group,' satirizing British and Tory leaders. The chief of her writings, however, is the three-volume '*History of the Rise, Progress, and Termination of the*

WARREN

American Revolution, *Interspersed with Biographical, Political, and Moral Observations* (1805). Tyler admits the "tone of undisguised partisanship ringing through the book," but calls it a "powerful delineation of a great period," and says its character-sketches may still be found of interest.

Warren, Richard Henry, American musician: b. Albany, N. Y., 17 Sept. 1859. He studied under his father and others in this country, and then (1880 and 1886) in Europe. In 1877-9 he was organist and director of music at the church of Saint John the Evangelist, New York, and in the same city has held similar positions at the Reformed Episcopal Church (1879-80), All Souls' (Author Memorial) Church (1880-6), and Saint Bartholomew's Church (since 1886). In 1889-96 and again in 1904 he was conductor of the Church Choral Society, during the same time conducting other organizations. Besides many church anthems and services, songs, etc., his compositions include 'Igala' (1880); 'All on a Summer's Day' (1882), and 'Magnolia' (1896), operettas; 'Phyllis' (1897), a romantic opera, produced at the Waldorf-Astoria Theatre 7-21 May 1900; 'Ticonderoga,' a string quartette; and a cantata.

Warren, Samuel, English novelist: b. Denbighshire, Wales, 23 May 1807; d. London 29 July 1877. He studied medicine at Edinburgh and law at the Inner Temple, was called to the bar in 1837, and was made queen's counsel in 1851. He was recorder of Hull (1854-74), represented Midhurst in Parliament (1856-9), and was appointed master in lunacy in 1859. His earliest work, 'Passages from the Diary of a Late Physician' (1832), appeared in several editions in both England and the United States, but his most popular work was 'Ten Thousand a Year' (1841), which has passed through many editions. It appeared in an abridged form in 1903. He published various other works, including 'Now and Then' (1847); 'The Lily and the Bee' (1851); and several law books.

Warren, William Fairfield, American educator: b. Williamsburg, Mass., 13 March 1833. He was graduated from Wesleyan University in 1853, ordained in the Methodist ministry in 1855, and for several years was professor of systematic theology at the Mission Institute, Bremen (now Martin Institute, Frankfurt) Germany. In 1866 he became acting president of the Boston Theological Seminary, and from 1873-1903 he was president of Boston University, occupying, also, during that time, the chair of philosophy of religion and comparative theology. His writings include: 'The True Key to Ancient Cosmology' (1882); 'Paradise Found,' published also in Japanese, Chinese, Spanish, and German (1885); 'The Story of Gottlieb,' translated into German and Arabic (1890); 'Constitutional Law Questions in the Methodist Episcopal Church' (1894); 'The Religion of the World and the World's Religion' (1900); etc.

Warren, Ill., village in Jo Daviess County; on the Illinois C., and the Chicago, M. & St. P. R.R.'s; about 26 miles east by north of Galena and 25 miles northwest of Freeport. It is in an agricultural and stock-raising region, and near

the lead mines of the Galena district. A good quality of tobacco is grown in the vicinity. The chief industrial establishments are flour mills, creameries, and tobacco factories. The village has a high school, graded schools, a public library, and a State bank. Pop. (1910) 1,500.

Warren, Ind., town in Huntington County; on the Salomonie River, and on the Toledo, Saint Louis & Kansas City Railroad; about 75 miles north by west of Indianapolis and 15 miles south of Huntington, the county-seat. It is in a region of good farm lands and in a natural-gas and petroleum belt. The chief manufacturing establishments are flour and lumber mills, cooperage, and machine shop. There are large shipments of hay, grain, and live stock. Pop. (1910) 1,702.

Warren, Maine, town in Knox County; on Saint George's River, and on the Maine Central Railroad; 60 miles northeast of Portland. It was first permanently settled in 1736, though it was known as a trading post as early as 1631; it was incorporated as a town in 1776. There are large deposits of limestone in the town, and the river affords power for manufacturing, the town contains cotton and shoe factories, and a powder mill. There is a public high school. Pop. (1910) 1,812.

Warren, Mass., town in Worcester County; on the Chicopee River, and on the Boston and Albany Railroad, 18 miles west of Worcester. It includes the villages of Warren and West Warren. It was first settled in 1731, and in 1741 was incorporated as a town under the name of Western. In 1834 the name was changed to Warren. It contains cheese factories, cotton and woolen mills and manufactories of steam pumps and engines. It has a public high school established in 1870, and a public library of about 10,000 volumes (1904) founded in 1876 by a library association. Pop. (1910) 4,188.

Warren, Ohio, city, county-seat of Trumbull County; on the Mahoning River, and on the Pennsylvania, the Erie, and the Pittsburgh & W. R.R.'s; about 50 miles southeast of Cleveland and 15 miles northwest of Youngstown. It is a region where much of the land is good for farming, but the chief industries of the city are connected with manufacturing iron products. Some of the principal manufactures are rolling mill products, flour, lumber products, automobiles, tubing, bath tubs, electric lamps, foundry and machine-shop products. In 1900 (government census) there were 110 manufacturing establishments, capitalized for \$2,952,697, and employing 2,081 persons to whom was paid annually the sum of \$997,455. The principal public buildings are the county court-house, the municipal buildings, churches, and schools. There are a high school, public graded schools, and a public library containing about 10,000 volumes. There are five banks, capitalized for \$500,000 and having deposits amounting to \$2,949,940. Warren was founded in 1799; incorporated in 1834. Pop. (1910) 11,081.

Warren, Pa., borough, county-seat of Warren County; on the Allegheny River, and on the Pennsylvania, the Western N. Y. & P., and the Dunkirk, A. V. & P. R.R.'s; about 120 miles northeast of Pittsburgh and 20 miles south

WARREN — WARENAMBOOL

of Chautauque Lake, N. Y.; long 79° 15' W., lat. 41° 50' N. It is in an agricultural and oil region, but the chief industries are connected with oil products and manufacturing. The principal manufacturing establishments are iron works, lumber mills, oil and gas engine factories, boiler works, piano factories, and furniture factories. Other manufactures are wood alcohol, oil and the by-products, glue, barrels, machinery used with oil wells and for manufacturing. In 1900 (government census) there were 119 manufacturing establishments, capitalized for \$2,869,000, and employing 1,270 persons to whom was paid annually the sum of \$585,590. The raw material used cost \$2,357,681, and the value of the total annual products was \$4,152,859. The principal public institutions are the county court-house, the State Hospital for Insane, the churches and educational institutions. There are 15 churches representing seven different denominations. There are seven public schools, one R. C. parish school, four private schools, a public library containing about 12,000 volumes. The five banks (November 1903) had a combined capital of \$575,000 and deposits amounting to \$4,534,350. The government is administered according to the Pennsylvania statutes for boroughs, which provides for a burgess and a council of 14 members who hold office three years.

Warren was settled in 1795 by Daniel McQuay, and was incorporated in 1832. The village of Gade was annexed in 1895. There are a large number of foreign-born inhabitants, chiefly Germans and Scandinavians. Pop. (1910) 11,080.

JAMES H. BURGER,
Secretary Board of Trade.

Warren, R. I., town in Bristol County, on the Warren River and Narragansett Bay, and on the New York, New Haven and Hartford railroad; 10 miles southeast of Providence. It was the old Indian town of Sowamset; a trading post was established there by white men as early as 1632, but permanent settlement was later. It was in the territory in dispute between Rhode Island and Massachusetts, and originally formed a part of the town of Swansea, Mass.; after the boundary was settled and Warren came under the jurisdiction of Rhode Island it was incorporated as a town (1747); in 1770 the town of Barrington was separated from it. From 1764-70 it was the seat of the College of Rhode Island (now Brown University). During the Revolutionary War the town was pillaged by the British, and a number of houses burned. It is now largely a manufacturing town, its manufactures including cotton goods, braid and twine. It has a public high school, and the George Hall Free Library. Pop. (1900) 5,108; (1910) 6,585. Consult Fessenden, 'History of Warren.'

Warren, (1) A tract of ground appropriated to the breeding and preservation of game or rabbits; also, a preserve for fish in a river. (2) In English law, a franchise or place privileged by prescription or grant from the crown for keeping beasts and fowls of warren, which are hares, rabbits, partridges, and pheasants, though some add quails, woodcocks, and water fowl. The warren is the next franchise in degree to the park, and a forest, which is the highest in dignity, comprehends a chase, a park, and a free warren.

Warrensburg, wô'renz-bûrg, Mo., city, county-seat of Johnson County; on the Black River, and on the Missouri Pacific Railroad; about 65 miles southeast of Kansas City. It is in a fertile agricultural region, and in the vicinity are large sandstone quarries. It has several mineral springs, noted for their medicinal properties. The springs and climate have much to do with making the city a favorite pleasure and health resort. The chief manufacturing establishments are flour mills, foundry and machine shops, wagon and carriage factories, and woolen mills. It has grain elevators, coal and stock yards. The city has the State Normal School for the Second District, a high school, and graded elementary schools. The three banks have (1903) a combined capital of \$100,000 and deposits amounting to \$837,440. Pop. (1910) 4,689.

Warrenton, Va., town, county-seat of Fauquier County; on the Southern Railroad; about 50 miles southwest of Washington, D. C. It is in the region of the foot-hills of the Blue Ridge, and its picturesque scenery and cool climate in summer have made it a favorite summer resort. It has seven churches, a high school, Fauquier Institute, private select schools, a national bank and a private bank. The town has gravity waterworks. Pop. (1890) 1,346; (1900) 1,627; (1910) 1,720.

Warrington, wôr'ing-tôn, England. ~ manufacturing town in Lancashire, on the river Mersey and the Manchester Ship Canal, near the Sankey and Bridgewater Canals, 15 miles east of Liverpool. The Latchford locks are notable features of the ship canal at Warrington. The public buildings and institutions include: the restored parish church of St. Elphin, in Decorated style; other modern parish churches; Nonconformist and Roman Catholic churches; the town-hall, in classical style; the museum, containing a free library and municipal art-gallery; the grammar school, blue-coat school, clergy orphan daughters' school, St. Elphin's schools, a training college for school mistresses, a municipal school of art, technical schools, and other educational institutions; post-office; public baths; new police premises; the market-hall; municipal gas works, waterworks, tramways, electric light works, and works for the treatment of night-soil; an infectious diseases and a smallpox hospital, and an infirmary; a gymnasium; a public cemetery; public parks and gardens; and military barracks. Of the numerous industries of the town the most important are the manufacture of iron and iron goods, wire, leather, soap, and beer. Warrington is an ancient town, and had at one time a house of Augustinian friars. The famous academy, which existed here from 1757 till 1783, had among its teachers Dr. Joseph Priestley, Dr. William Enfield, Dr. Aikin, Dr. John Taylor, the Rev Gilbert Wakefield, and other eminent men; it is now represented by Manchester College, Oxford.

Warnambool, wâr'nâmb-bool, Australia, a seaport town in Victoria, on Warnambool or Lady Bay, 166 miles southwest of Melbourne. The principal public buildings are the Episcopal, Roman Catholic, and other churches, various banking and insurance offices, mechanics' institute, the Odd Fellows' and the volunteer artillery halls, a hospital, and benevolent asylum,

WARS OF THE WORLD

etc. Steamers ply regularly several times a week to Melbourne, and a good trade is done from the port in wool and other agricultural produce. The town contains a flour mill, biscuit factories, boot factories, tanneries, breweries, etc.

Wars of the World. The story of the wars of the world, if told in anything like its entirety, would be practically a history of the human race, for wherever nations have risen to greatness and have bred men capable of performing great deeds the records of these acts of heroism have almost invariably been made on those fields of battle upon which the supremacy of the nation itself has been accomplished. In the record of the wars of the world the student may read the tale of human progress—the story of the advance of civilization—for it cannot be denied that man's high place in the world to-day is largely a reward bestowed upon him in return for the brutality and bloodshed of the battlefields upon which his ancestors fought. That there have been wars that have been unnecessary is a fact that cannot be questioned, any more than one would deny that warfare has often been unnecessarily brutal, and yet, from a logical point of view, these are merely incidents which reflect upon but do not detract from the integrity of the original propositions: that war is the means by which superior nations have attained their superiority; that by war civilization was extended, and that in the winnowing process afforded by such international conflicts the fittest alone have survived and all that which was opposed to human progress or contrary to the best interests of civilization has been cast aside, to be lost and, eventually, forgotten by all save the historian who does not deign to record the most ignoble things in the life and customs of the earth's peoples.

Early History.—Unfortunately it is impossible to state, even approximately, when the first battle of the world was fought. In the early ages, of course, primitive man had all he could do to maintain a bare existence and preserve himself against the fury of the wild beasts so eager to attack him; but even tradition furnishes no clue to enable the student to discover at what period men first turned against other men to do battle with the crude instruments that had been devised only as a means of protecting themselves from the savage animals in the forests. All we know is that Osymandyas of Egypt, supposed by some to be the Osiris of the priests, is the first warlike king mentioned by history. He passed into Asia and conquered Bactria, about the year 3100 B.C. If Osymandyas was the first warlike king, however, he was not the last, for it has been estimated that since his time no less than 6,860,000,000 men have lost their lives on fields of battle; but, in spite of this gruesome record men have fought and will probably continue to conduct wars against each other, while all nations will be compelled to arm themselves with the latest fighting inventions, for, with the history of the past to guide them, they realize only too well that the Power that is not always prepared to protect its rights and properties with the sword may not unlikely find itself with very little except its honor to defend. Probably the first wars originated in nomad life and these conflicts were undoubtedly occasioned by the disputes which arose between the various

tribes in regard to their rights of possession in favorable pasturage. When all tribes devoted themselves to the flocks and herds there was little to discriminate between them, but, gradually, certain tribes began to assume different characteristics. One became attached to the art of agriculture; another devoted its time to hunting and fishing, while a third class still remained shepherds of the flocks. It was this difference of occupation which finally became the natural source of hostilities, for it established a series of classes, the stronger of which began to prey upon the weaker. Naturally, those who devoted themselves to the hunt became the victors in war, and, by reducing their victims to a condition of slavery, threw the manual labor, which they despised, upon the shoulders of others. In fact, there is a tradition in western Asia, that Nimrod, who is mentioned in the Bible as "a mighty hunter before the Lord," was the first person to engage upon an extensive system of warfare for the express purpose of obtaining slaves, and that it was he who introduced the practice of requiring conquered nations to pay an annual tribute, or, in other words, a ransom for their release. However true this may be we find that the ancient Old Testament days were full of such warfare, warfare in which the outcome was either tribute or slavery. History began on the banks of the Nile, and along the Tigris and the Euphrates; for these valleys, like two great oases, were practically the only habitable spots in the great desert. Fitted with all known conveniences for travel, with roads suitable for the passage of vast armies, these two centres of habitation finally became great rivals. In fact, whenever any particularly energetic ruler appeared in either spot he at once set out, as if moved by an irresistible impulse, to conquer his rival and so control western Asia. It may truthfully be said, therefore, that the history of this time is little more than one continuous record of struggles between Egypt and Mesopotamia, a condition which existed until Europe entered the lists and became the conqueror. In Egypt, during this age, the military class held such a prominent position in society that fully one third of the land was in the possession of the 410,000 men who composed the army.

As the Persians trusted for success mainly to numbers, war to them was little more than an exhibition of brute force. Sometimes as many as 1,000,000 men were brought into service for one campaign. In battle the troops were massed in deep ranks, those which were supposed to be the bravest being in front, but, if the line of battle was once broken, defeat appears to have been inevitable, for the army lost heart, even if the commander himself did not set the example of flight, and the general stampede that followed usually cleared the battlefield. Rawlinson's description of the appearance of the Persian forces in time of war is one of the most vivid word pictures painted by any historian:

The troops were drawn from the entire empire, and were marshalled in the field according to nations, each tribe accoutred in its own fashion. Here were seen the gilded breastplates and scarlet kilts of the Persians and Medes, there the woollen skirt of the Arab, the leathern jerkin of the Berber, or the cotton dress of the native of Hindustan. Swart savage Ethiopians from the Upper Nile, adorned with a war paint of white and red, and scantily clad with the skins of leopards and lions, fought in one place with huge clubs, arrows tipped with stone, and spears terminating in the horns

of an antelope. In another, Scythia, with their loose spanned trousers and their tall pointed caps, dealt death around from their whirling bows; while near them Amyrians, habited, and wearing corselets of quilted linen, wielded the tough spear or the still more formidable iron mace. Rude weapons, like cane bows, unfethered arrows, and staves hardened at one end in the fire, were seen side by side with keen swords and daggers of the best steel, the finished productions of the workshops of Phœnicia and Greece. Here the bronze helmet was surmounted with the ears and horns of an ox; there it was superseded by a fox-skin, a lantern or wooden skull cap, or a band drawn fashioned out of a horse's scalp. Besides horses and mules, elephants, camels, and wild asses diversified the scene, and rendered it still more strange and wonderful.

Wars of the Romans.—Although the Persians fought and won battles in spite of their crude methods of fighting, Greece was the mother of the art of warfare. Of course, it must not be imagined, however, that the splendid body of perfectly trained soldiery comprising the armies of Athens, Sparta, Thebes, or Macedon was the product of a day, or of the genius of a single man, for nothing less than centuries were required for the perfection of this wonderful force. In the heroic days, the days of the Homeric battles, the Greek soldiers were no more to be commended than their Persian rivals. Loosely organized, poorly drilled, and badly equipped, the mass of the army was capable of doing little more than give the inspiration of numerical strength to the small bodies of heroes who did all the fighting. At length, however, the idea of the phalanx evolved itself, and, in a remarkably brief period of time, the history of the world was changed. At no time prior to the invention of the modern instruments of war has man conceived such a formidable weapon as the attack of a charging phalanx. It was this powerful engine of war that accomplished the downfall of the Persian force at Marathon. It was a still more perfect phalanx that resulted in the defeat of Thebes and the victory of Macedon on the fields of Chæronæa. It was clearly the Greek phalanx—solid, erect and terrible in its effect—that enabled Alexander to inaugurate the campaign that had for its purpose the conquering of the entire known world. It was with the aid of the phalanx that Athens was preserved; that the Peloponnesian war was won by Sparta, and it was this same maneuver that saved the day for the Greek forces, until, at last, the Roman legions swept down upon a degenerate Macedon to declare the end of the Grecian empire. The story of Rome's supremacy is not dissimilar to that of the rise and fall of the Grecian power. She scorned to make use of the phalanx, her legions fighting in such open formation that those in the front rank could fall back, when weary, and allow those in the second file to advance and take their places, and yet the discipline and generalship of the great army was so perfect that it succeeded in establishing a wider empire than that of Alexander's, an empire which, in 133 B.C., included all of southern Europe from the Atlantic to the Bosphorus, as well as a part of northern Africa. Syria, Egypt and Asia Minor were then Roman dependencies. Her army had made her practically mistress of the civilized world. Several centuries elapsed before Rome's glories began to fade. During this time her power was still further extended, civil wars had been suppressed and revolutions crushed, for when the Roman army could fight according to the scientific rules of warfare it was practically an

invincible force. When the destroyers of the great empire came, however, they brought with them no knowledge of the science of war which Rome knew so well. To Alaric the Goth, Attila the Hun, and Genseric the Vandal, war was simply a question of mere numerical human strength. They had no more idea of the advancement in military art than had the Saracen horde that swept across the country and that might have planted the standard of Islam in every nook and corner of Europe if Charles Martel had not won his great victory on the plain of Tours. Against these three great barbaric leaders Rome was almost powerless, and as they swept down upon her, as one wave of the sea follows another, Rome fell, never to rise again. City after city was spoiled and burned; Rome, even, opened her gates without a blow. The tiara and purple robes of the empire were sent to Constantinople, and Zeno appointed Odoacer to be Patrician of Italy.

The Middle Ages.—From the fall of Rome and up to the close of the 15th century, wars were less frequent between nation and nation than among the various nations themselves. French fought French; Germans, Germans, and Spaniards, Spaniards, and even the war between the English and the French, the war that desolated France for more than a century, was no exception to this rule, for the enmity that was the cause of all the strife was not that of two rival nations, but was due entirely to the fact that the rulers of England were French princes, themselves hereditary sovereigns of French provinces, like Normandy or Poitou. Similar conditions existed in other parts of Europe so that the student who reads of the wars of the Middle Ages is struck by the absence of the well-planned and carefully executed campaigns that distinguished the warfare of both previous and later periods. There were civil wars, it is true; local insurrections, or single battles of more or less importance, but, with the exception of the invasion of the Saracens, the expeditions of Charlemagne, and the conquests of England by the Danes and the Normans, there is little to remind one of the well organized systems of warfare which distinguished the days of Greece and Rome, and which have since been revived by nations of modern times. It was not until almost the close of the Middle Ages that anything was done to improve the art of war as it was known to the ancients. Then the invention of gunpowder and the abandonment of armor revolutionized the science of fighting. Strange as it may seem, however, gunpowder was known for more than two centuries before the French, at the close of the 16th century, armed their soldiers with matchlock muskets, while conservative England, fearing that archery would be superseded, forbade the use of the new weapon as late as the time of Henry VIII.

Modern Warfare.—By Gustavus Adolphus, "the father of the modern art of war," as he is called by Col. Dodge, his biographer, the new weapon was accepted at its true worth, and, arming his corps with them he evolved the then original plan of preparing an attack with artillery. The adoption of the musket, however, was not the only development in warfare that may be traced to this great strategist, for it was he who first substituted the line for the mass formation, one of the greatest innovations in modern tactics.

WARS OF THE WORLD

It was not until the close of the Middle Ages, therefore, that military science, having slept for centuries, awoke to the possibilities of greater perfection in armament as well as in discipline. From the time of Gustavus Adolphus and Frederick the Great up to and after the close of the Civil War in America, military methods were undergoing such a change that the period may be regarded as that of the rehabilitation of the science of warfare, for nearly every kind of arm or maneuver that was in use during the Middle Ages has now become obsolete. In the accomplishment of all this improvement in armament and tactics credit is due to all the great generals, including Napoleon, who hired the best mechanics to make experiments for him and who gave to Europe its first breech-loader. To-day, however, everything but the small calibre rifle, and possibly the bayonet, has been relegated to the scrap heap, just as the antique fighting tactics, like the various variations of the phalanx and mass formations have given place to a more and more open formation, as the perfection in the fighting arms has required such alterations in the fighting methods of the world's armies.

Decisive Battles.—Creasy, the historian of warfare, who treats of incidental battles rather than of connected wars, selects the following as the "Fifteen Decisive Battles of the World":

1. Marathon, at which, on 26 Sept. 490 B.C., 11,000 Greeks defeated a Persian force numbering more than 110,000 men. The Greek army was commanded by such generals of genius as Miltiades, Aristides, and Themistocles. The Persian army was forced to retreat to Asia.

2. Syracuse, 419 B.C., when the besieged Syracusans turned upon the invading Athenians, almost completely destroying their forces, driving them, "with happy slaughter, over the cliffs, which an hour or two before they had scaled full of hopes and confident of success."

3. Arbela, the battle between Alexander the Great and Darius Codomannus which decided the fate of the Persians; 1 Oct. 331 B.C.

4. Metuerus, at which Hannibal, the brother of Hannibal, was defeated and slain by the Roman army under the command of Livius and Claudius Nero; 207 B.C.

5. Teutoburg, 9 A.D., the battle at which Varus and the Romans were defeated by the Germans, and which was regarded at Rome as such a national calamity that Augustus is said to have cried aloud in agony, "Varus, give me my legions!"

6. Chalons, at which, in 451 A.D., Aetius defeated Attila the Hun, compelling him to retire into Pannonia.

7. Tours, at which Charles Martel saved Europe by his great victory over the invading hosts of the Saracens. This conflict is also sometimes known as the battle of Poitiers; 732 A.D.

8. Hastings, at which, on 14 Oct. 1066, Harold II. of England lost his life and kingdom in battle against William, Duke of Normandy.

9. Orleans, besieged by the English during October 1428, it was bravely defended by Goucor, who realized that its fall would bring ruin to the cause of Charles IV. of France. On 8 May 1429, the siege was raised as the result of the heroism of Joan of Arc.

10. The Spanish Armada, the naval battle at which the Spanish fleet was almost completely destroyed by the British.

11. Muenheim, at which the French and Bavarians were defeated by the English under the Duke of Marlborough, 2 Aug. 1704.

12. Poltava, where Charles XII. of Sweden was completely defeated by the Saxons; 1 May 1709.

13. Saratoga, the engagement regarded as the greatest almost suffered by the British forces during the Revolutionary War in America. At this battle, fought on 17 Oct. 1777, the British general, Burgoyne, still flushed by his victory at Germantown, was obliged to surrender his entire force of 5,701 men to the American commander, General Gates.

14. Valmy, where the French, commanded by Kellerman, defeated the Prussians, commanded by the Duke of Brunswick, 20 Sept. 1792.

15. Waterloo, at which the great Napoleon was compelled to accept defeat at the hands of the Duke of Wellington's forces; 18 June 1815.

Wars of the World.—Irrespective of the character of the individual battles the following list of the most important wars that have been waged between the various nations since the Middle Ages is generally regarded as reasonably complete and thoroughly representative:

1455-1485. *The War of the Roses*, which ended with the defeat and death of Richard III. at Bosworth, 26 Aug. 1485. The war was between the Lancastrians and the Yorkists and obtained its name from the fact that the former wore the red rose as their emblem, and the latter, the white. The union of the roses was consummated in 1486, when Henry VII. was married to Princess Elizabeth, daughter of Edward IV.

1587-1588. *War of the Armada*. In 1587 Philip II., King of Spain, collected and equipped what he believed to be an invincible fleet, for the purpose of effecting the subjugation of England. Although it consisted of more than 130 ships and was manned by picked men, it was practically destroyed by the British fleet, commanded by Sir Francis Drake, Sir John Hawkins, and Lord Charles Howard, 29 July 1588.

1618-1648. *The Thirty Years' War* between the Catholics and Protestants of Germany. Beginning in Bohemia, in 1618, it ended with the Peace of Westphalia, 30 years later.

1648-1652. *The Civil War of the Fronde* may not be one of the great wars of the world, but it is so thoroughly representative of the conditions of the times that it is usually included in such lists. It originated in the minority of Louis XIV., and during the reign of Queen Anne of Austria and Cardinal Mazarin, and was strictly a war of classes. On one side were ranged the supporters of the court and the nobility, while the citizens supported by the Parliament, were pitted against them. It ended with the ignoble defeat of Condé at the battle of Saint Antoine.

1702-1713. *War of the Spanish Succession*, a conflict which arose over the question whether an Austrian or a French prince should succeed to the throne of Spain. From the beginning the British court was opposed to Louis and the succession of the Duke of Marlborough would have delivered the throne to the Austrians if the allies, by withdrawing one after another, did not leave the Bourbons free to succeed.

1741-1763. *War of the Austrian Succession*. At the death of Emperor Charles VI., his daughter, Maria Theresa, attempted to assume control of the throne which the great powers of Europe had guaranteed to her under the law known as the Pragmatic Sanction. Contrary to their agreement, however, all the powers except England determined to rob her of her inheritance. The plot failed and the peace of Aix-la-Chapelle was signed, Frederick the Great being the only monarch to profit by the conflict. He was bought off by the cession of Silesia.

1756-1763. *The Seven Years' War* was the result of Maria Theresa's determination to recover the Silesian territory which she had ceded to Prussia. By careful diplomacy an alliance was formed between Austria and France, Russia, Saxony, Sweden and Poland, leaving England as the only power to which Prussia could look for support. Although it was believed that Frederick would be unable to stand against such odds he was so generally victorious that he was not only able to retain his control over Silesia, but his successes in battle established the position of Prussia as one of the five great nations of the world.

1775-1783. *War of the American Revolution*. The revolt of the American colonists as a protest against English oppression is one of the most serious conflicts in which England has been engaged, costing, as it did, the greater part of her American possessions. The war culminated with the signing of the treaty of Paris, 30 Nov. 1783.

1789-1794. *War of the French Revolution*. The uprising in France was distinctly a class awakening, but it resulted in the abolition of the monarchy and the establishment of the first republic. During this period of internal agitation, however, other nations took advantage of the supposed opportunity to meet France with less danger to themselves, and yet, during the very days when the Terrorists were sending their victims to the guillotine the republican army was enjoying such continued success that several threatened frontiers were pacified, Belgium was overrun, Holland conquered, and peace was signed with Prussia and Spain.

1794-1797. *The Italian Campaign*. Bonaparte, the new military figure in European affairs, was given his first opportunity to exhibit his great genius for generalship, for with a force of 36,000 men he destroyed everything but courage, he advanced upon three well-equipped bodies of the flower of Italian and Austrian soldiery, vanquished them and was already in the act of advancing upon Vienna when the Austrian govern-

WARS OF THE WORLD

ment, in consideration, asked for a suspension of hostilities. The treaty of Campo Formio, signed in 1797, was the result. By this France took Belgium and the long-covered boundary of the Rhine while Venice and its dependencies were apporportioned to Austria.

1805-1815. *The Wars with Bonaparte*, which may be said to have commenced with Austria and to have ended only with Waterloo, occupied the attention of Europe for more than 10 years. The third coalition, which was formed in 1805, Napoleon's projects of advancement, consisted of England, Austria, and Russia, but the "sun of Austerlitz" went down upon a defeat so crushing that the conquerors were glad to accept the terms of the treaty of Pressburg, even at the cost of the very existence of the Holy Roman Empire which had continued for more than 1,000 years. In 1806 a fourth coalition, composed of Prussia, Russia, and England, was formed, but in one day Napoleon annihilated these powers, and, entering Berlin, lifted even the tomb of Frederick the Great. A year later, they saw the humiliation of Russia made complete, for while the battle of Eylau may be said to have been indecisive, there could be no question about the victory of Friedland, and Alexander, forced to sue for peace, signed the treaty of Tilsit. The Peninsular Campaign in 1808, the war with Austria in 1809, and the war in Spain, 1808-12, were continuous exhibitions of the power of the French Bonaparte, and it was not until the Russian campaign, 1812, when the French army retreated from Moscow like a mass of straggling fugitives, that the powers of Europe saw an opportunity to shake off the yoke which the bold usurper had forced them to bear. Again there was a coalition formed, a gigantic confederation of power which included the forces of England, Russia, Prussia, and Sweden, and while Napoleon's new army succeeded in defeating the allies at Lutens, Bliuzer, and Dresden, his own fall at the terrible battle of Ligny was his last to Paris to prepare for the inevitable fall which Fortune had in store for him, the fate of Waterloo and his own abdication.

1812-1814. *The War of 1812* between Great Britain and the United States, which was caused by the aggressions of the British and their refusal to recognize the rights of the American republic on the high seas, resulted in the defeat of the English invaders. It concluded with the treaty of Ghent, signed 18 Dec. 1814.

1821-1829. *The Greek War of Independence* was the culmination of four centuries of Turkish bondage. Prior to this there had been several attempts, all of which had been crushed with religious cruelty, but the revolt that broke out in 1821 was of a different character, as many Europeans contributed both their money and their services to aid the Greek insurgents. During the contest which followed fully one half of the population is said to have perished, and the Turks, who had called the Egyptians to their assistance, were finally overwhelmed by the revolutionists whom England, Russia, and France formed a league to help the Hellenes. As the result the fleets of the combined forces defeated the Turks and the Egyptians in the bay of Navarino, the French troops drove the Egyptians from the Peloponnese, and freedom for Greece was at last attained.

1831-1839. *The Belgian War of Independence* was inspired by practically no other cause than that of a desire for freedom. The revolutions in America, in France, and in Greece were a means of inspiration, and as Belgium had never been in sympathy with Holland it required but a spark to kindle the flame of insurrection. In 1830, therefore, the independence of Belgium was declared.

1845-1848. *The Mexican War* with the United States resulted from the annexation of Texas, the independence of which had never been recognized by the Mexican government, and from Mexico's refusal to treat with the United States regarding the adjustment of the boundary. After several sharp engagements, in nearly all of which the United States forces were overwhelmingly victorious, Mexico was taken and peace was proclaimed, 2 July 1848.

1853-1855. *The Crimean War* grew out of a dispute between the Greek and Latin churches as to the right of exclusive possession of the Holy Places in Palestine. France and Russia took opposite sides upon the question, but when a mixed commission decided in favor of the Greeks and against France the French armed. Russia, on the other hand, continued to make demands upon the Sultan, commanding among other things that the czar be recognized by treaty as the official protector of Christians within the limits of the Turkish domain. In 1853 the czar also proposed that England should join him in partitioning the Sultan's empire, a proposition which was immediately refused. In view of the strained relations, however, it was but natural that Turkey should declare war against Russia. In 1854 both England and France came to the Sultan's aid, and an expedition against the Crimea having been decided upon, the allied forces, numbering nearly 60,000 men, attacked the Russians, who, under the command of Prince Menshikoff, had entrenched

themselves, 30,000 strong, on the heights of Alma, a position which was supposed to be unassailable. In spite of this, after one sharp contest, the Russians were routed. Peace was proclaimed in April 1856.

1856-1857. *The Persian War*. The taking of Mesopotamia by the Persians, 25 Oct. 1856, was considered such a violation of the treaty of 1853 by the British that war ensued between Great Britain and Persia. Several sharp battles followed, in which the Persian forces suffered defeat, and final peace was proclaimed in April 1857.

1857-1859. *The Indian Mutiny*, which continued for nearly two years, grew out of a result of the sepoy, or native soldiers in India. The original cause of the trouble was that the cartridges given to them were said to be greased with tallow or lard, which was regarded as an insult to their religious, a Hindu being forbidden to touch cows fat and a Mohammedan, lard. It was this in 1856 before the rebellion was finally crushed, while in the meantime, the white residents at Delhi, Cawnpore, and many other places were massacred with terrible brutality. Those at Lucknow were just able to hold the city until relief arrived.

1861-1865. *The Civil War* in the United States, which resulted in the defeat of the Southern forces, the re-establishment of the Union, and the emancipation of the negro.

1868-1898. *Cuban War for Independence*. Although the first attempt to wrest the island of Cuba from the hands of Spain was made as early as 1850, the first insurrection or formal revolution, did not occur until the fall of 1868. From that time, however, revolutions were of frequent occurrence, but all were suppressed by the Spanish forces until 1898, when the United States formed an alliance with the revolutionists, thus enabling Cuba to obtain the freedom that had so long been denied.

1870-1871. *The actual cause of the Franco-Prussian War* was the jealousy of Emperor Napoleon, who had been an important witness of the success of Bismarck's negotiations, which had resulted in the greatly increased power of Prussia. More definite causes were found, of course, the refusal of France to permit the French to purchase Luxembourg from the king of Holland, and the effort of Bismarck to place Prince Leopold of Hohenzollern-Sigmaringen on the throne of Spain being two of them, but it is the consensus of opinion among historians that the war was both precipitated and unjust, and that as the emperor had been unprepared both as to the numerical strength of his army and as to its state of preparation, his surrender was practically a foregone conclusion from the beginning of the conflict.

1876-1903. *The Anglo-Boer War*. Although preceded by lapses of several years the hard feeling which always existed between Great Britain and the small South African republics resulted in many serious disturbances which culminated, in 1899, in the Anglo-Boer War, the complete victory of the English arms and the annexation of the South African territory.

1877-1878. *The Russo-Turkish War*. The spirit of revolution which spread through nearly all the Turkish possessions during 1875 and 1876 and which resulted in the revolt of Bosnia and Herzegovina and Bulgaria, and the declaration of war by Serbia and Montenegro, was the immediate cause of the Russo-Turkish war, which ended with Russian victory, 3 March 1878.

1894-1895. *Chinese-Japanese War*. A revolt in Korea and a call upon China for assistance was the direct cause of the conflict between China and Japan. When the latter power uninvited sent troops with a proposal of joint action against the revolutionists, China protested vigorously, and after much dispute the war began. It resulted in Japanese victory and the cession of much territory on the part of China, considerable of which Japan was compelled to relinquish because of the protests of Russia, France and Germany.

1898-1902. *The Spanish-American War* was the natural outcome of the interference of the United States in the war between Spain and her revolutionary colony, Cuba. Having fought with great bravery and against almost overwhelming odds for years the state of insurrection had degenerated into such barbarous cruelty on the part of those who were striving to suppress it that the American people decided that it had passed the bounds of humane warfare. For this, and several other reasons, Congress determined to give assistance to Cuba, upon which war was promptly declared. It resulted in overwhelming defeat for the Spanish forces, independence for Cuba and the accession of considerable colonial territory by the United States.

1904. *Russo-Japanese War*. Russia's eagerness to extend her territory to such an extent as to secure ports that should be open at all seasons of the year — a desire which made her set upon Manchuria with a firm hand and tempted her to cast covetous eyes upon Korea — was the cause of such persistent objection upon the part of Japan that the Russo-Japanese war resulted.

Editor "American Year-Book."

WARSAW — WARSHIPS, ANCIENT

Warsaw, wâr'sâ, Ill., town in Hancock County; on the Mississippi River and on the Toledo, Peoria & Western railroad; 100 miles southwest of Peoria. Fort Edwards was established within the limits of the town in the War of 1812. The largest river steamers can ascend the Mississippi to the town; and it is a shipping point for the agricultural produce of the region. It also has several manufacturing industries, including cooperage works, flour and woolen mills, pickle works, and manufactories of agricultural implements. It contains a public high school. Pop. (1890) 2,721; (1900) 2,335; (1910) 2,254.

Warsaw, Ind., city, county-seat of Kosciusko County; on the Tippecanoe River, and on the Pittsburg, Ft. W. & C., and the Cleveland, C. C. & St. L. R.R.'s; 105 miles north of Indianapolis. It was settled in 1836, and chosen as the county-seat in 1837; it was incorporated as a town in 1854, and as a city in 1867. It is in a lake region, and is popular as a summer resort. It is also an agricultural region, and Warsaw is the chief trade centre of the county. It has large canning and pickling works, flour mills, creameries, and manufactories of agricultural implements. A large park and the county court-house are among its notable features. There is also a public high school established in 1872, and a public library. Pop. (1910) 4,430.

Warsaw, N. Y., village, county-seat of Wyoming County; in the valley of the Oatka Creek, on the Erie, and the Buffalo, R. & P. R.R.'s; 40 miles south-southeast of Buffalo. It was first settled in 1804, and was incorporated as a village in 1816. It is in an agricultural region; and there are important salt deposits in the vicinity. The village contains salt works, broom factories, manufactories of knit goods, a foundry, carriage factories, lumber and saw mills. It has a public high school, established in 1897, with a large library of about 15,000 volumes (1904). The water-works are owned and operated by the village. Pop. (1910) 3,206.

Warsaw, Russia, the former capital of Poland and now of a government, situated partly on a flat, and partly on a height rising gradually from the left bank of the Vistula, here crossed by an iron bridge 1,660 feet long, and by a railway bridge, communicating with the suburb of Praga, 325 miles east of Berlin. It consists of the city proper and several suburbs, enclosed for the most part along with it by a rampart and fosse, and dominated by a vast citadel erected by the Russians. In the older parts the streets are narrow, and the houses, generally of indifferent appearance, are huddled together without any order; in the newer part, and more especially in some of the suburbs, the streets are often spacious and many ranges of handsome buildings are seen. There are several large public squares, among which that of Sigismund, adorned with a bronze colossal statue of the third king of that name, is particularly deserving of notice; and the vicinity is well provided with beautiful promenades. The more remarkable public buildings are the Roman Catholic cathedral, the Russian cathedral, the church of the Holy Cross, the church of the Carmelites, the Lutheran Church, the Zamek or ancient castle of the Polish kings, a huge

pile on a height overhanging the Vistula; the palace of Casimir, occupied by the university and adorned in front with a statue of Copernicus; the Saxon palace, with fine gardens attached to it; the Krasinsky palace, occupied partly by the superior courts of law and partly by government offices; several other palaces similarly occupied; the town-house, arsenal, mint, custom-house, exchange, barracks, several theatres, and the bazaar of Marieville, consisting of a large square lined with arcades. The principal educational establishments are the university, suppressed after the rebellion of 1830, reopened in 1864; a lyceum, technical, commercial, and many other schools. Among the benevolent institutions are a town and a military hospital, a foundling hospital, a deaf and dumb, and two lunatic asylums. The manufactures consist of metals, beer, tobacco, textiles, chemical products, furniture, artificial flowers, musical instruments, etc. The trade is very extensive, Warsaw being by far the most important commercial emporium of Russian Poland, and carrying on a large traffic both with the interior and with Thorn and Dantzic, by means of the Vistula. Warsaw, though very ancient, did not become the capital of Poland till about the middle of the 16th century, when it superseded Cracow. It has witnessed much warfare, the suburb Praga generally being the field of action. Here in 1656 the Poles were defeated by Charles Gustavus of Sweden. The chief interest belonging to the city is connected with the insurrection of 1794, when after the capture of Kosciusko at Maciejowice, the dispirited and disorganized remnants of the Polish army defended the ramparts of Praga against the victorious Russian forces under Suwaroff. On 3 Nov. 1794, the Russian general ordered an assault, and after a fierce struggle the ramparts were carried, more than 15,000 Polish soldiers being slain, drowned in the Vistula, or taken prisoners, and an almost equal number of unarmed inhabitants of every age and sex, brutally massacred. In the evening a great fire arose, which destroyed a large part of the city. The vicinity of Warsaw was also the principal seat of the Polish war in 1831. Pop. about 750,000, of whom above a fourth are Jews.

Warships, Ancient. Armorclads and protected war vessels were not wholly unknown to the ancients. The ships of the Greeks and Romans were often fortified with a thick fence of hides, which served to repel the missiles of their enemies and afford protection to their own crews. Hides, possibly brass and iron, and certainly thick timber, entered into the construction of the turrets and towers with which the fighting ships of ancient and mediæval times were fitted, especially when used for harbor defense, as in the Venetian turret ship of the 9th century. Felt made an early appearance as a defensive armor on shipboard, as we find that in a sea fight off Palermo in 1071 between the Normans and Saracens, the former hung their galleys with this material by way of a defensive cuirass. The Norman knights had probably adopted this device from their enemies, for felt had been used for some time for this purpose on board the huge "dromons" of the Saracens. These, the "battleships" of those days in the Mediterranean, usually rowed 50 oars a side, each oar being manned by two men, so that here we have a couple of hundred samson ac-

WARSHIPS, ANCIENT

counted for at once. When the soldiers, sail trimmers and artificers who worked the war engines and siphons for Greek fire are added, it is evident that the crew must have been very large, and have required a ship of considerable dimensions. These great warships were armored with woolen cloth soaked in vinegar to render it fireproof, and hung with mantlelets of red and yellow felt, so that their cuirass was not only useful, but ornamental as well. At this period and for many hundred of years later additional protection was afforded to those on deck by the ranging of the bucklers and shields of the warriors on board along the gunwales. Later, in the 15th and 16th centuries, special "pavesades," or bulwarks, were provided in lieu, composed of large oblong shields, supplied for the purpose. In addition to felt, the time-honored leather armor also entered into the defensive panoply of the "dromons," and in the war of the Sicilian Vespers, Pedro III. of Aragon covered two of the largest ships of his fleet with leather before sending it against Charles of Anjou. Conrad of Montferrat, at the siege of Tyre in 1187, either invented, or at all events, caused a special class of leather-protected vessels to be built, which were called barboats or duckbacks. They would now probably be called turtlebacks. They would appear to have been small craft covered with a strong leather-protected domed roof through portholes or openings in which the archers and crossbowmen could fire without exposing themselves. They proved very effective against the Saracens, and in 1218 the entrance of the Nile was forced by 70 of these little armorclads.

It is said that the Great Dromon—whose capture by Richard Lion-Heart is still commemorated—was equipped with leaden armor. This was in 1191, and probably lead was occasionally used for protective purposes throughout the next two or three centuries, although there is no record of any ship so protected until 1530. In this year the Knights of Saint John, those sworn opponents of the Turk, built one or perhaps two leadclads. At any rate, one account says that they built such a ship in this year at Malta, while another describes a ship of this kind called the "Santa Anna," launched at Nice in the same year. The Santa Anna's leaden armor plates were attached to her sides by bolts of brass, and it was said for her that she could "resist the artillery of a whole army," and at the same time could sail or row as fast as any of her unarmored contemporaries. She was a big ship, with six decks, a reception saloon, a chapel, a specially constructed powder magazine and a bakery. She was present at the taking of Tunis in 1535 and played an important part in its capture. Lead was not infrequently used at this period for sheathing ships under water, in the same way that copper is still found so useful. Thus the French ship *Grande-Françoise*, launched in 1527, one of the largest and most famous ships of her day, was sheathed with lead from her keel to the first wale above her waterline.

The Spaniards attempted to protect their galleons of the Invincible Armada by building their sides four or five feet thick, but the heavy English guns "lashed them through and through." But now at last we arrive at a real armored ship in the present day acceptance of the word. Not only an armorclad, but a real

ironclad. This was constructed in Antwerp in 1585, with a view of breaking through the lines of the Spanish army under Alexander of Parma, which was at that time closely investing the city. It was a large flat bottomed craft, with a central casemate or battery built of thick balks of timber and plated with iron. It was intended to be, and very likely was, impenetrable to any artillery that the Spaniards could bring against it; and in hopeful anticipation that their ironclad ship would raise the siege and put an end to hostilities, the men of Antwerp christened her the "Finis Belli." In addition to a heavy battery of guns, the *Finis Belli* carried a large body of musketeers, some of whom were stationed aloft in her four fighting tops, while the rear were well protected by the loop-holed bulwarks on the upper deck. Unluckily for the besieged Dutchmen, she ran aground before she had effected anything at all, and fell into the hands of the Spaniards, who nicknamed her the *Caranjamula*, or "Bogey." They contrived to get her afloat, and brought her down to the camp of Alexander of Parma, where she became a great attraction to the sightseers of the period. As for the Dutchmen in the doomed city, they henceforward only referred to their experiment as the "Perdita Expense" or "Wasted Money." Ten years previous to this, others of the Dutch patriots had built a somewhat similar contrivance, which very possibly was also armored. This was the *Ark of Delft*, a twin vessel supporting a floating fortress, which was propelled by three hand-worked paddle wheels placed between the two hulls.

It is a curious but well known fact that if we go to the Far East we can find a parallel to almost any Western invention. It is therefore not astonishing to find that the Japanese possessed a paddle-propelled armorclad in the year 1600. This quaint craft, like the old leather-clad "barbotes" of the 12th century, was turtlebacked, with ports for firing from. She was covered with iron and copper plates fitted together like the cells of a honeycomb, mounted 10 guns, and, like the *Ark of Delft*, was moved by a central paddle wheel. Though there is no record of any more ironclad ships before the 19th century, our own navy, at any rate, used various devices to protect its ships in the 18th. According to a French writer, the sailors of his country were astonished at the perfection to which the English had attained in this direction. "Old cables," he writes, "held in place by pieces of iron, barricaded the whole length of the bulwarks; mantlelets of old rope hung over the ship's sides, to diminish the shock of our cannon balls, and, beneath a thick rope, netting stretched from poop to bowsprit. The English fought under shelter, maneuvering, without ceasing, out of musket range, so as to riddle our detachments of fusiliers, with their cannon shot. So we lost 200 men for every 30 of the English put out of action."

This system of armoring was, however, soon adopted by the French. The Spaniards endeavored to improve on this, and in 1782 hoped great things from the celebrated floating batteries employed at the great siege of Gibraltar by the Duke de Crillon. The floating batteries were mounted on ships of the line, cut down to a particular size. On the top they were defended by a covering made of cordage and wet hides. This was not the complete protection

WARSHIPS, MODERN

that was originally intended by the Chevalier d'Arcon, their constructor, according to another account of the same date as the above, which states that "the covering was to have been laid over with strong sheets of copper, and by this means the red-hot balls, the bombs and other destructive implements would have slid off."

The fate of these experimental armorclads offered no inducement to the naval constructors of the day to make further researches in the direction of protection, so that till comparatively recent times we find our sailors depending only on their "wooden walls" to resist the projectiles of the enemy. The oaken sides of the British ships, we may note in passing, were often exceptionally stout and difficult to penetrate. In the fight between the *Glatton*, 56-gun ship, and four French frigates, a brig and a cutter, mounting 220 guns between them, their 12 and 24-pounders failed to penetrate her sides, and she beat them all off with great loss at the cost of one officer and one man wounded.

But the Americans, from the very commencement of their existence as a nation, set themselves to make improvements in naval warfare. David Bushnell constructed a practical submarine boat in 1773. Torpedoes were used by him and others in the war with this country, and for the purpose of towing these contrivances alongside our ships, they invented and built in 1814 a paddle-propelled turtlebacked boat lying very low in the water and covered with "half-inch iron plates, not to be injured by shot." About the same period the celebrated inventor, Robert Fulton, who had already constructed one or two submarine boats and various classes of torpedoes, built a steam frigate which he called the *Demologos*, or *Voice of the People*, but which is sometimes known as the *Fulton I*. This, the first steam warship ever constructed, had her sides no less than 13 feet thick of alternate layers of oak and ash wood, a thickness absolutely impenetrable by any gun then afloat. In 1829 this vessel was blown up by accident, and was succeeded in the American navy by the *Fulton II*, a ship which appears to have been protected by some kind of iron armor.

Various proposals were made to use iron plating to protect the sides of ships of war from this time forward, but until the French constructed a number of armorplated batteries for use in the Crimean war, nothing practical came of the suggestions of inventors. Their success at the bombardment of Kinburn demonstrated the value of armor plating. England at once followed suit with others of the same kind, some of which are still doing duty as hulks. Then came the French *La Gloire*, the British *Warrior*, the ironclads and monitors of the American war, and henceforward the steady evolution of the armored fighting ship, which has provided us with the majestic battleships of the present day.

Warships, Modern. It has become almost an axiom that military success, in a broad sense, depends upon command of the sea, and absolute command of the sea can only be attained in one way, by the capture or annihilation of the enemy's fleets. This makes it imperative that the enemy be met in battle, a result easily attained if he is of equal or superior force and, if his force is inferior, he must be made to fight. The questions of how, and when, and

where this should be done belong to the science of naval strategy, for our purpose it is enough to recognize that the destruction of his fleet is the paramount object, we may then turn to consider what means have been provided for accomplishing this end. It can readily be seen that this serious problem of bringing the enemy to battle and making him fight, whether he will or not, can only be met by providing vessels capable of navigating the seas in any weather, and capable of meeting and destroying, or fighting to a standstill, any class of vessel that may be brought against them. In the old days, when all ships were on an equal footing as regards the motive power, when there was no protection and when the best ship was the one carrying the most guns, the problem was simple; but now, when each vessel must carry her own fuel, when high speed requires a disproportionate share of space and weight, when the competition between gun and armor has developed so rapidly that each series of new guns requires either thicker or better armor for protection against its projectiles, the problem is much more complex, and though of late years the steel maker and the engineer have done much toward improving the quality of their products, its principal result has been to increase the quantity used in a given case.

Qualifications.—Having seen that the primary purpose, indeed the *raison d'être* of the true warship is to fight, it follows that the most efficient war vessel, in the sense of the present day, is that combining in the highest degree, offensive and defensive qualities. It may be said in a general way, that the most important of these qualities are armament, protection, radius of action, speed, and reliability of machinery. There are, however, great differences of opinion among naval experts and designers as to the relative importance of these qualities, which are all further complicated by subordinate and antagonistic elements, and to unite the whole, in the best possible ratio, is the aim of the designer of every warship projected. The above mentioned qualities may be altered proportionately, increasing one and decreasing another, but in every case there is one absolutely limiting factor which cannot be ignored, that is the total weight which a given vessel can carry. A ship of definite displacement can carry a certain number of tons weight with safety, and this weight may not be increased, so it follows that if any one quality is abnormally developed, some other quality or qualities, no matter how important, must be sacrificed. Thus every warship is a compromise in which the designers must nicely balance each element, an addition for some especially desirable feature entailing a reduction in something else considered not quite so important in view of the particular service to be required of the vessel. Being driven to these compromises and owing to the impossibility of uniting these discordant elements, each in its highest degree of excellence, in any one ship, designers have been forced to divide warships into a number of different classes, each class to fulfil special requirements and in each one of which one or more qualities reaches its highest development in accordance with the requirements of its class and the duties to be performed by the finished vessel.

Classification.—The principal classes of warships which exist at the present time, as the result of an evolution along diverging lines enforced by the mutual antagonist qualities are: battleships, armored cruisers, protected cruisers, gunboats, monitors, torpedo boats and destroyers, scouts, and some intermediate types combining the characteristics of several classes. In the navies of the larger powers, where expense need not be considered and where the number of vessels must perforce be large, the lines between the classes are fairly well defined, but in many of the smaller navies the effort has been to combine in one vessel too many high qualities, usually resulting in an inferior ship and one excelling in no respect, though there are a few cases of this kind where an exceptionally skilful designer has been remarkably successful in his combination of elements.

Before going into a detailed description of the different classes of warships it may be well to take a general survey of the subject and to revert to the principal qualities before mentioned. The statement that a vessel is constructed entirely of steel, implies no inherent strength in itself. All war vessels are now built of steel, and it is only when thick steel plates are secured to their sides or deck, for the express purpose of protecting their machinery, magazines, guns, and personnel from the fire of the enemy, that any advantage is derived from it. Beginning with the lighter ships, such as torpedo boats, small gunboats, etc., we find there is no protection whatever except, in some of the gunboats, that given by a judicious arrangement of the coal bunkers, and the slight protection afforded the gunners by the gun shields. On some of the larger gunboats and on all of the protected and armored cruisers as well as battleships we find the protective deck, a heavy steel deck, covering the whole of the vessel at about the level of the water line and protecting the machinery, boilers, magazines, etc. On some of the larger protected cruisers thin side armor appears; on the armored cruisers there is thicker side armor covering a greater area and, on this type, the turret or barbettes appears, while on the battleship the protection reaches its highest development.

Battleships.—The battleship represents the highest type of warship evolved at the present time, and from a purely military standpoint it is the most formidable and most necessary class of vessel, for upon the battleships fall the real burden of an offensive demonstration. The marked characteristics of the battleship are large guns and thick armor and these are the two qualities to which other elements, noticeably speed, are sacrificed. This sacrifice, however, must be made, for the battleship must bear the brunt of the heavy fighting and be able to give and receive the hardest possible blows. Speed is an important element and it is well for the battleship to have the highest speed possible as long as it entails no reduction in her fighting qualities; but speed never won a decisive battle and of all the elements entering into warship design high speed is the most uncertain, the most difficult to maintain in a high degree of efficiency, and it requires the greatest sacrifice in other qualities. The reason for this is that in a given ship the power, and consequently the weight and space occupied by the machinery necessary for an increase in speed, increases

in a much higher proportion than the speed gained. Thus a battleship that could make 17 knots with 12,000 horse-power, the machinery installation weighing 1,150 tons, would require, to make 20 knots, about 27,000 horse-power, the machinery weighing 2,570 tons. In addition to this, her greater power would involve a greater consumption of fuel per day, therefore a greater quantity or weight of fuel must be carried and, as before stated, the extra weight for machinery and fuel could only be obtained by a reduction in the armament, or protection, or both, or by an increase in size. When one notes that on a modern battleship the armament and ammunition is about 9 per cent, the protection about 25 per cent, the propelling machinery about 12 per cent, and the coal about 6 per cent of the total displacement, it can easily be seen how seriously a change in any one of these items affects the whole ship. The armament or battery of warships is divided into two classes, called respectively, the main and the secondary batteries. The main battery comprises the heaviest guns on the ship, those firing large shells and armor-piercing projectiles, while the secondary battery consists of small rapid-fire and machine guns for use against torpedo boats, or to attack the unprotected or lightly protected gun positions of an enemy. On the modern battleship the main battery usually consists of four 10-inch, 12-inch, or 13-inch breech-loading guns, mounted in pairs in revolving barbettes or turrets, one forward and one aft, on the centre line of the ship. Occasionally these guns are mounted *en barbette*, that is, the gun projects over a circular wall of armor, without the revolving turret or hood; it is not uncommon also, in foreign navies, to find but one gun in a turret or barbettes, and sometimes these turrets or barbettes, instead of being placed on the centre line of ship are *en echelon*, that is, the forward one on one side of the vessel, the after one on the opposite side. However, it is the almost universal practice at the present time to place the four heaviest guns as first stated, in pairs, in revolving barbettes or turrets, on the centre line of ship. In addition to these heavy guns it is usual to mount a number of smaller guns, from 3 to 8 inches diameter of bore, on each broadside, though often the 8-inch guns are also mounted in turrets. A battery arrangement that has obtained to a considerable extent in our navy is to have, in addition to the two turrets of 12- or 13-inch guns, four smaller turrets, each containing two 8-inch guns. These turrets are arranged in a quadrilateral, two on each side, the forward two somewhat abaft the forward large turret, and the after two forward of the after large turret, with in addition to this, a number of 6-inch or 7-inch guns mounted on the broadside. Later this arrangement has been somewhat changed by superposing one of the 8-inch turrets on each of the large turrets, the other two in some cases being placed one on each side of ship about amidships, while in other cases they were omitted entirely, their place being taken by a greater number of broadside guns. The *Indiana*, the first of our battleships, has the two large turrets referred to, each containing two 13-inch guns, the quadrilateral arrangement of four turrets each with two 8-inch guns and two 6-inch guns on each broadside. Next came the *Iowa* with a somewhat similar arrangement except that 12-inch and 4-inch guns were used in place of the 13-inch

and 6-inch guns respectively. She was followed by the Kearsarge class, with 4 13-inch guns in turrets, arranged as before, with a turret mounting 2 8-inch guns superposed on each 13-inch turret, and with a broadside battery of 14 5-inch quick-fire guns. Next came the Alabama class, with 4 13-inch guns, in the large turrets, no 8-inch guns at all and 12 6-inch guns on the broadside. After the Alabama class the 13-inch gun disappears, and in the Maine class, which followed, there are 4 12-inch, no 8-inch and 16 6-inch quick-fire guns. The Virginia class shows a return to the 8-inch gun, her arma-

the above we have confined ourselves to a description of the battery arrangements on the battleship class only. In the armored cruiser class a somewhat similar arrangement is followed, except that the guns in the main turrets are not above 10-inch bore, and are often 8 inches. As to the protected cruisers and gunboats, their batteries are so varied that they can best be considered by consulting the table which gives the batteries of a number of different classes of vessels.

The protection, that is, the armor on a battleship, is her most marked characteristic. The

9,500 I. H. P. Main Engine of a Battleship.

ment being 4 12-inch, 8 8-inch and 12 6-inch guns. On the Connecticut and Vermont classes, our largest battleships, we have 4 12-inch, 8 8-inch, and 12 7-inch, the latter being a new gun used here for the first time. On the latest battleships, the Mississippi class, we have 4 12-inch, 8 8-inch and 8 7-inch guns. The superposed turret was entirely an American idea and has not yet been introduced abroad. It has the advantage that, the number of gun positions being reduced, better protection can be given the guns and their accessories on the same weight, or the same protection given on less weight, leaving an allowance of weight to be used elsewhere. In

basis of all protection on the modern war vessel is the protective deck and it is common to the battleship, armored and protected cruisers and many gunboats. It is a heavy steel deck covering the whole of the vessel at or a little above the level of the water line, extending the entire length of the ship and firmly secured at the ends to the heavy stem and the stern post, and at the sides it usually slopes, meeting the sides of the ship 3 or 4 feet below the water line. Below this heavy deck lie the vitals of the vessel, the boilers and machinery, the magazines and shell rooms, the ammunition passages and all the parts where an explosion would be most dan-

WARSHIPS, MODERN

gerous and would create the greatest havoc. For safety every opening on this deck is covered with a heavy steel grating to prevent, as far as possible, fragments of shell from passing below. The most vulnerable part of the vessel is her water-line, for, if a shell should enter and explode here, tearing a large hole, she would probably quickly capsize and sink; it is here therefore that the heaviest armor, called the water-line belt, is usually placed. The lower edge of this belt rests on a projection or ledge, called the armor shelf, at the point of meeting of the protective deck and the ship's side; it is therefore 3 or 4 feet below the water-line and extends up about the same distance above. In the earlier battleships it was usual to run this

whole water-line of the vessel. The barbettes, one forward and one aft, about over the magazines, rest upon the protective deck at the bottom and extend up about four feet above the upper deck. At the top of the barbettes, revolving on rollers, are the turrets, sometimes called hoods, containing the guns and the loading mechanism and all of the machinery in connection with the same, and the turret ammunition hoists lead up through the barbettes from the magazine below, delivering their load of charge and projectiles at the breech of the guns in position for loading and, as they pass up inside of the barbettes and turrets, they are as well protected as is possible. It is usual to work an athwartship line of armor from the water-line belt to the barbettes, resting upon the protective deck, and this athwartship or diagonal armor is here the same thickness as the belt. We now have, enclosed within heavy armor a fort, citadel or redoubt, its bottom being the protective deck, its sides the water-line belt, and its ends the athwartship or diagonal armor, a barrette being placed at each end of the citadel, thus the space between the protective deck and the next deck above is well protected. Resting upon the armor belt and the diagonal armor, and following the same direction, is a course of armor usually somewhat thinner called the lower casemate armor; it extends up to the lower edge of the broadside gun ports and, resting upon it in turn is the upper casemate armor, following the same direction and forming the protection for the broadside battery. The explosive effect of the modern shell is so tremendous that were one to get through the upper casemate and explode immediately after entering, it would undoubtedly disable several guns and kill their entire crews; it is therefore usual to isolate each broadside gun from its neighbors by light nickel steel bulkheads $1\frac{1}{2}$ or 2 inches thick, and, to prevent the same disastrous result among the guns on the opposite side, a fore-and-aft bulkhead of about the same thickness is placed on the centre line of the ship. Each gun of the broadside battery is thus mounted in a space by itself, somewhat similar to a stall. Just abaft the forward turret there is a vertical armored tube resting on the protective deck and at its upper end is the conning tower, a protected station from which the ship may be worked in action, the tube giving protection to all the mechanical signaling gear leading to different parts of the ship, the steering gear, etc., while just forward of the after turret is another armored station for signaling. It is not a difficult matter to design a ship that will be practically unsinkable by the attack of gun fire, as it only means placing a sufficient thickness of armor at the water-line. A war ship might as well be sunk, however, as rendered useless in battle, and the one thing that modern naval battles have shown is the absolute impossibility of the unprotected personnel of a ship working her guns when exposed to the hail of shot and shell from a modern battery of rapid-fire and automatic guns; as a result of this we see all the later battleships, armored cruisers and protected cruisers increasing the protection of the broadside batteries and exposed gun positions, even at the expense of the water-line belt. It has also been advocated lately to do away entirely with the protective deck, thus gaining many tons weight which

H. P. Cyl. Port Engine of Battleship, Looking Forward.

water-line belt the length of the machinery space only, leaving the ends of the vessel unprotected; this was considered dangerous, however, as penetration at these unprotected ends would probably have serious consequences, so, as armor improved in quality, enabling thinner and therefore lighter plating to be used, the weight so gained was utilized by continuing the protection, at a reduced thickness, all the way to the bow and stern, thus protecting as far as possible the

could possibly be used to better advantage elsewhere. The foregoing description, in a general way, portrays the disposition of armor usually employed on the battleship type, but it may be considered to apply as well to armored cruisers, remembering that in the latter class of vessel the armor is thinner all through. The design and building of battleships shows a constant development. Each new vessel is, in many respects, an improvement on her immediate predecessor; there is some uncertainty, however, as to the best type, due to the fact that there have been no naval engagements, since the modern warship was evolved, of sufficient importance to settle beyond question whether this development is along correct lines or not. The trend of development, however, has been in the following directions: for the battleship, a reduction in the size of the largest guns, made possible by im-

capacity. Captain Walker, U. S. N., has said of the armored cruiser: "Her role . . . is assumed to be that of a vessel possessing in a high degree offensive and defensive qualities, with the capacity of delivering her attack at points far distant from her base in the least space of time." For this statement to apply to the modern armored cruiser, remembering that the ability to fight must be measured by the standard set by the battleship, it should be reversed and the degree should read "moderate" instead of "high." There is no class of warship concerning which there is a greater diversity of opinion. Many eminent authorities hold that the armored cruiser, with a speed enabling her to give or decline combat at will and to overtake protected cruisers and commerce destroyers, with an armament sufficient to ensure the destruction of such vessels when overtaken, and with suf-

4,000 I. H. P. Main Engine of a Destroyer.

provements in material and higher velocity of projectiles; an increase in the size of rapid-fire guns; a much improved quality of armor, with a greater proportion of the ship covered by same; an increase in speed and coal capacity, and a saving in machinery weights due to the introduction of the water tube boiler and to a generally higher grade of material; and finally an increase in size of the whole vessel. For the armored cruiser almost the same advance has been made as in the battleship, and in many respects the armored cruisers are merely battleships somewhat weakened in defensive and offensive qualities to gain a few knots speed.

Armored Cruisers.—The armored cruiser can best be described as a battleship in which the qualities of offense and defense have been much reduced to gain high speed and great coal

sufficient armor to protect her from the guns carried by such ships and possibly sufficient to enable her to engage a battleship under conditions favorable to herself and of her own choosing, adds a very important element of fighting strength to the fleet, and that in this class the requirements of warships are most nearly fulfilled. On the other hand there are many who hold that the armored cruiser is an anomaly, something less than the battleship and more than the protected cruiser, performing satisfactorily the duties of neither, with no special function of her own and lacking the great desideratum in warships, ability to fight in proportion to her great size and cost. With the increase in speed of the battleship until there is only a difference of about 3 knots between its speed and that of the armored cruiser, and this differ-

1. PROTECTED CRUISER "MILWAUKEE," LAUNCHED SEPTEMBER, 1904.

DISPLACEMENT, 2,700 tons. SPEED, 22 knots. FUELER CAPACITY, 1,500 tons. ARMOR, Belt, 4 inches. ARMAMENT: Fourteen 6-inch R. F.; eighteen 3-inch R. F.; twelve 2-pounder semi-automatic; four 1-pounder automatic; two 3-inch field guns; two 0.50-caliber machine guns; eight 0.30-caliber automatics. COMPLEMENT, 645.

2. BATTLESHIP "CONNECTICUT," LAUNCHED SEPTEMBER, 1904.

DISPLACEMENT, 13,000 tons. SPEED, 18 knots. COAL SUPPLY, 2,300 tons. ARMOR, Belt, 11 inches to 4 inches. ARMAMENT: Four 12-inch, eight 8-inch, twelve 7-inch, twelve 3-inch rapid-fire guns, 20 smaller guns. TORPEDO TUBES, 3 submerged. COMPLEMENT, 803.

ence most apparent on the trial trip, as any decrease in efficiency will necessarily be most severe on the faster type, and when this gain of a few knots speed is at such an expense of armor and armament as to practically preclude the armored cruiser from joining battle with the battleship, it hardly seems worth while to put practically the same amount of money into vessels of the weaker type. There is doubtless a large field for the armored cruiser in swift attack upon isolated or unprotected positions, in raids on the trade routes of maritime states or in blockade and many other duties; but, before the end is reached, the enemy's battleship squadron must be met, and this the armored cruiser can not do, at least with much prospect of success. Prophecy is always an uncertain occupation, but judging as well as we can from the present line of advance, it would seem most likely that this debatable question will be met by increasing somewhat the speed and coal endurance of the battleship and reducing slightly her protection at the water-line or possibly in the protective deck, while the armored cruiser reduces her speed somewhat and increases her armor and armament, until the two types merge. Aside from speculation, however, the consensus of opinion seems to be that the more recent armored cruisers in all the great navies are too large. However this may be, the fact remains that, if any one country develops a type of warship having particularly marked characteristics, other nations who wish to remain on a footing of equal strength, must build vessels of the same type to meet them, and all of the more important naval powers are now adding armored cruisers to their fleets. It may be of interest to add that France, at the present time, is building armored cruisers almost to the exclusion of battleships, and it must not be forgotten that the French nation has, on other occasions, inaugurated the line of naval development. The preceding table gives the particulars of battleships and armored cruisers, built and under construction, in the United States navy.

Protected Cruisers.—The protected cruiser class depends for protection upon the protective deck alone. These vessels were very popular in all navies some years ago, and in them everything was sacrificed to what was considered at that time high speed. The Japanese *Naniwa*, 3,650 tons displacement and 18¾ knots, and the Chilean *Esmeralda*, 3,000 tons displacement and 18¾ knots speed, were considered phenomenal vessels and were regarded as models. Owing to the difficulty of a small ship maintaining high speed in anything but the most favorable weather, vessels of this class gradually increased in size until they reached 7,000 or 8,000 tons displacement. Being without any protection save the protective deck, these vessels could be utterly destroyed by the fire of modern rapid-fire guns even though neither their protective decks nor their water-lines were pierced, in fact they were not much better than armed ocean liners. After a few years the armored cruiser came out, immeasurably superior, and naval designers quickly turned to that type. It is probable that the protected cruiser will be modified, and her place taken, as far as speed is concerned, by a new type, just now being developed, the Scout. As its name implies this type will be very fast, 23 to 25 knots, with large coal capacity and no protection. The Scout class is not designed to

fight but rather to act as the eyes of the fleet. They are of good size, 3,000 to 4,000 tons displacement, with fine lines for speed. Their duties will be to discover and keep in touch with the enemy and to carry news to their own battle squadron; they will also be capable of destroying

Torpedo Boat Destroyer.

torpedo craft. As to unprotected cruisers and gunboats, while necessary in times of peace for general police of the seas and to show the flag in foreign ports, they are of no use in battle except against unarmored vessels. A table giving the particulars of the protected cruisers in the United

WARSHIPS, MODERN

States will be seen on two of the foregoing pages.

Monitors.—The monitor is a strictly American type and is dear to the American heart on account of the service the first monitor did the country in the Civil War, by defeating the Confederate armored ram Merrimack, or Virginia as she had been renamed. The monitor, being very low in the water, with her water line heavily armored and her upper deck only three or four feet above the surface, affords a very small target, and that well protected, for an enemy's shot; this same quality, however, makes her a very poor sea-boat as, in bad weather or any sea, her deck is awash and it is impossible to work her guns. For harbor or coast defense, however, the monitor has no superior in the minds of many, and we have recently completed four new monitors for this purpose, the Arkansas, Nevada, Florida, Wyoming. Of course there is more or less discomfort in life on board a vessel of this class, as all living quarters are below the water line and artificial ventilation and light must be used constantly, still it is not as bad as might be expected and one becomes accustomed to the conditions. (On one of the preceding pages may be found a table giving particulars of monitors now in the navy.

Torpedo Boats.—In the torpedo boat we have reached a class of vessel in which there are practically no qualities of defense and in which the weapon of offense has changed from one of precision, the gun, to one of great uncertainty, the torpedo. The torpedo boat depends for success in her attack upon both her small size and her speed, and largely upon the elements of surprise and secrecy; indeed secrecy is vital to her, as discovery means, at the least, failure in her attack, and it is generally admitted that in an attack by a torpedo boat on a warship, say a battleship, if the torpedo boat is discovered in anything like reasonable time her destruction is assured. The rapid-fire and automatic guns discharge such a stream of projectiles that it is highly improbable a torpedo boat, once discovered, could get within range to use her weapon effectively. This virtually precludes all idea of torpedo attack by daylight and even at night the conditions are not all favorable. The torpedo boat when running at high speed rides on the crest of a wave created by herself, and the white spray and foam that accompany this wave are picked up by the battleship's searchlight long before the boat herself can be seen; in addition to this, at high speed her presence is betrayed by flames and sparks pouring from the stacks. On the other hand in thick weather, in rain or in fog, the boat has a good chance against the battleship or cruiser, and the knowledge held by a blockading fleet that a number of torpedo boats were in the shelter of the harbor awaiting an opportunity to attack, could not fail to have a telling moral effect upon their crews and would require the ships being kept in constant motion and moving much farther out to sea at night. Torpedo boats should be small, as the larger the boat the more easily she will be discovered. On the other hand a small boat is unseaworthy, hence there is a natural division into harbor defense and sea-going boats, and roughly speaking a sea-going torpedo boat should not be less than 125 feet long. As boats below this length are too small to keep the sea

for any length of time they must operate from a base of supplies, and this limits them practically to coast defense. The services required of the larger boats, however, are of two kinds: they must be able to make torpedo attacks upon the enemies' vessels and able to protect their own fleet against similar attacks. As has been said before, the construction of one type of vessel with marked characteristics is an incentive to the development of another type to destroy her. Just as the armored cruiser was evolved to destroy the swift protected cruiser so has the torpedo boat destroyer, commonly called the "destroyer," been evolved to meet and destroy the largest and fastest torpedo boats. Of larger size and therefore more seaworthy, with a stronger armament and greater coal capacity and speed, and therefore the superior of the torpedo boat in every respect, with the same outfit of torpedoes as the boat and therefore just as dangerous to an enemy, the destroyer promises to drive out the torpedo boat type for everything except harbor defense, just as the armored cruiser shows signs of driving out the protected cruiser type. A comparison of what may be considered standard torpedo boats of the three types is given in the following table:

	Harbor defense boat	Sea-going boat	Destroyer
Length	99' 6"	138' 9"	248'
Beam	12' 6"	14' 3"	23' 3"
Draft	3' 3"	4' 11"	8' 6"
Displacement, tons	45.78	105	435
Speed: Knots per hour ..	20.8	22.5	29.84
Indicated horse-power	850	1,720	8,300

It is usual for maneuvering purposes and as a precaution in case of accident, to make nearly all torpedo boats of the three types with twin screw, though some foreign navies, noticeably the German, make many single-screw boats. As in most other types the tendency here is in the direction of too high speed. Most authorities agree that 25 knots is enough for a torpedo boat and 28 knots enough for a destroyer; this is speed sufficient for all practical purposes and the weight saved can be put into the main engines, which are of necessity extremely light and therefore liable to break down. The destroyer type is quite seaworthy and is capable of accompanying the fleet, provided means is at hand for replenishing the coal and store supply. This country has not gone into the construction of torpedo boats and destroyers as extensively as most of the other powers, as is shown in the following table:

	U. S.	England	France	Germany	Russia
First class torpedo boats.	35	117	176	203	98
Destroyers	16	130	43	39	54

The detailed particulars of United States destroyers and torpedo boats are given in preceding tables.

The following table gives the total number of steel and iron steam vessels and other craft of the United States navy, with their displacement. It also indicates the number of vessels fit for service and those under construction or authorized 30 June 1910:

Naval authorities disagree as to the relative positions of the United States and other Powers in their naval strength. Pulsifer in the 1910 *Naval Year Book* gives the United States second place in vessels strength, with Great Britain first and Germany third. In the official table of sea strength prepared by the office of Naval Intelligence of the Navy Department, Germany is put in second place and the United States is third. See also TORPEDO BOATS.

Wart, an elevation on the skin, usually a collection of lengthened papillæ, closely adherent, and ensheathed by a thick covering of hard dry cuticle. From friction and exposure to the air the surface presents a horny texture, and is rounded off into a small button-like shape. Simple warts are commonly seen on the hands and fingers (rarely on the face or elsewhere) of persons of all ages, but especially of children. Among other varieties of warts are: (1) the verruca digitata, more elongated in shape and less protected by cuticle than the common wart, and which is apt to occur on the scalp, especially in persons of adult age, and sometimes occasions great annoyance in brushing and combing the hair; (2) subungual warts, generally of syphilitic origin, growing, as their specific name implies, beneath or at the side of the finger or toe nail, and which originate beneath the nail, as they increase crop out either at the free extremity or the side of the nail, and are usually troublesome, often very painful; (3) venereal warts, caused by the direct irritation of the discharges of gonorrhœa or syphilis, and occurring about the parts which are liable to be polluted with such discharges. These last attain a larger size, and are more fleshy and vascular than other warts. It is supposed that warts are always due to some local irritation. Venereal

warts are certainly contagious; with regard to others, nothing can be said positively on this point. In consequence of the capricious way in which warts often undergo spontaneous cure, there are numerous popular "charms" for their removal. Common warts are so apt to disappear that they may be often left to themselves. If it is desired to remove them, glacial acetic acid may be applied with a camel's hair pencil till the wart is pretty well sodden, care being taken not to blister the neighboring skin. One or at most two applications will usually be sufficient. Nitrate of silver and tincture of iron are popular and general applications. Salicylic acid in collodion is also very effective. Small warts hanging by a neck may often be very simply removed by the tight application of an elastic ligature to the base. The wart usually shrivels up and falls off within a week. Electrocautery is sometimes successfully employed. The other varieties must be left to the surgeon.

Wart-hog, an extraordinary African swine, several species of which form the genus *Phaco-chærus*, and are so named from the presence of a large warty protuberance on each cheek. The *P. alicani* of Northern Africa is familiar in Abyssinia under the names of halluf or Haroja. Another species is the vlakke vark (*P. ethiopicus*) of Dutch South Africa, which, like the preceding form, has formidable tusk-like canines and a large wart under each eye. The animal attains a length of 3 or 4 feet, and is reddish-gray with a stiff blackish mane and spinal stripe. It is fierce and courageous and fights desperately when brought to bay.

Warta, vârtă. See WARTHE.

Wartburg (vârt'boorg) Castle, an ancient mountain castle of Germany, not far from Eisenach, belonging to the Grand Duke of Saxe-Weimar. It was built between 1069 and 1072, and was the residence of the landgraves of Thuringia. The elector Frederick the Wise of Saxony caused Luther, who had been outlawed by the Diet of Worms, to be carried thither, where he lived from 4 May 1521 to 6 March 1522, engaged in the translation of the Bible. See LUTHER, MARTIN.

Wartburg, War of the, the name given to a great poetic contest which took place in 1206 or 1207, when the minnesingers assembled at the Wartburg, Germany, for a trial of their skill before Hermann I., landgrave of Thuringia. The poem descriptive of the contest was entitled *Krieg von Wartburg*, and appeared about 1300. It is a singular, wild, and inharmonious composition, divided into two parts, and its authorship is unknown. The Wartburg festival was a celebration held at the castle by German students on 18 Oct. 1817, in the third centenary year of the Reformation. Several hundred students from 12 universities were present, and here the colors of the student societies were displayed for the first time. The participants in the festival were suspected of an intention of introducing republicanism into Germany, and after the assassination of Kotzebue a large number of them were arrested and imprisoned, and not long afterward all participation in the student societies was forbidden by the authorities.

Warthe, vârtě, or **Warta**, a European river, the principal tributary of the Oder River. It rises near Kromolov, Russian Poland, and

WARTON

After a northern and western course, enters Prussia at the confluence of the Prosna. It flows westerly and empties into the Oder at Küstrin. Its total length is 487 miles.

Warton, Joseph, English poet and critic: b. Dunsfold, Surrey, 1722 (baptized 22 April); d. Wickham, 23 Feb. 1800. He was the son of Thomas Warton the elder, and brother of Thomas Warton the younger (q.v.). He studied at his father's grammar school at Basingstoke; then at Winchester; and finally at Oriel College, Oxford, where he was graduated B.A. 13 March 1743-4. During the next ten years, he served successively as curate at Basingstoke, Rector of Winslade, and Rector of Tunworth. Then, in 1755, he became usher, or second master, and in 1766 headmaster, of Winchester College. In 1759, he had received from Oxford the degree of M.A.; in 1768 he received those of B.D. and D.D. He remained at Winchester 38 years; but, after suffering three student insurrections, he resigned in 1793 and withdrew to a living at Wickham. There he died, 23 Feb. 1800.

Among English writers of the 18th century, Joseph Warton is significant for being probably the earliest consciously romantic poet. The romanticism evident in his hostility to the cold correctness of the school of Pope, and in his enthusiasm for Spenser, Shakespeare, and Milton, appears consistently throughout his works. It appears in 'The Enthusiast; or the Lover of Nature,' written in 1740 when Warton was eighteen and included in his first volume 'Ode on reading West's Pindar' (1744).

What are the lays of artful Addison,
Coldly correct, to Shakespeare's warblings wild?
Whom on the winding Avon's willow'd banks
Fair Fancy found, and bore the smiling babe
To a close cavern.

His Romanticism he again avows in the advertisement to his second volume 'Odes on Various Subjects' (1746): "The Public has been so much accustomed of late to didactic poetry alone, and essays on moral subjects, that any work where the imagination is much indulged, will perhaps not be relished or regarded. The author therefore of these pieces is in some pain lest certain austere critics should think them too fanciful or descriptive. But as he is convinced that the fashion of moralizing in verse has been carried too far, and as he looks upon invention and imagination to be the chief faculties of a poet, so he will be happy if the following Odes may be looked upon as an attempt to bring back Poetry into its right channel." This romantic creed he states even more completely in his 'Essays on the Genius and Writings of Pope' (1757). This book has been called the "most important of all the critical works that aided the Romantic movement . . . one of the most significant books of the whole century." In it, Warton openly attacked the poetry of Pope; demolished the ideals of the pseudo-classical school, and in their place set up the romantic standards that have since been accepted. It makes Warton, despite the comparative inconsequence of his poetry, one of the most important forerunners of English Romanticism.

His chief works are: 'Ode on Reading West's Pindar' (1744); 'Odes on Various Subjects' (1746); an edition of Virgil in Latin and English, to which he contributed translations of the Eclogues and the Georgics (1753), twenty-four essays, chiefly in literary criticism, contributed to 'The Adventurer' (1753-6); 'Essays on the Genius and Writings of Pope' (vol. I, 1757; vol. II, 1782); and an edition of Pope's works in nine volumes (1797).

ARTHUR H. NASON,

Instructor in English, New York University.

Warton, Thomas, English writer: b. Basingstoke, 9 Jan. 1727-8; d. Oxford, 21 May 1790. He was the younger son of Thomas Warton, and brother of Joseph Warton (q.v.). He studied under his father until, at the age of sixteen, he matriculated, 16 March 1743-4, at Trinity College, Oxford. With this university he was associated for life. Here he received his B.A. in 1747; took orders; became a tutor; received the degree of M.A. in 1750, a fellowship in 1751, and the degree of B.D. in 1767. For two terms of five years each, beginning in 1757, he was professor of Poetry; and in 1785 he was appointed Camden Professor of History at Oxford, and Poet Laureate. In 1771, he was made a fellow of the London Society of Antiquaries; and from 1782 he was, like his brother Joseph, a member of Dr. Johnson's Literary Club.

Warton's significance in English literature consists in the influence that he exerted in favor of the romantic revival in the 18th century. In his 'Observations on the Faerie Queen of Spenser' (1754), in his critical edition of Milton's early poems, and especially in his great 'History of English Poetry' (1774-81), he demonstrated to all who could understand, that English poetry did not begin with Dryden, and that it might rightfully deal with subjects other than those chosen by the Queen Anne wits. His 'Observations on the Faerie Queen' is a strong plea for romanticism and for a study of Spenser, of chivalry, and of mediæval life. His 'History of English Poetry' embodies, in the clear prose style of Warton's day, a knowledge, rare even in our own, of English poetry from the close of the eleventh century to the end of the Elizabethan period. Later scholarship has discovered in Warton's 'History' some errors of detail; but it remains, nevertheless, a monument of wide reading and profound research. In addition to these historical and critical works, Warton promoted the romantic movement by his experiments in the verse-forms and subject-matter of Spenser and Milton. Notable among his imitations of the latter are his sonnets, his ode on the 'Approach of Summer,' and his 'Pleasures of Melancholy.'

His chief works are: 'The Triumph of Isis' (1749); 'Newmarket, a Satire' (1751); a humorous 'Guide' to Oxford (1760); an anthology of university wit entitled 'The Oxford Sausage' (1764); 'Observations on the Faerie Queen of Spenser' (1754); 'History of English Poetry from the Close of the 11th to the commencement of the 18th Century' (vol. I, 1774; vol. II, 1778; vol. III, 1781; vol. IV, never published); 'Poems . . . by John Milton . .

WARWICK — WASECA

with Notes Critical and Explanatory . . . (1785); a collection of his own poems (1777); fourth edition (1780); and another edition, corrected by himself before his death (1791).

ARTHUR H. NASON,

Instructor in English, New York University.

Warwick, wôr'k. Guy. See **GUY OF WARWICK.**

Warwick, Richard Neville, EARL OF, English soldier and statesman, known as the "King-maker" b. about 1428; d. Barnet, Hertfordshire, 14 April 1471. In the battle of St. Albans (1455), the opening action of the Wars of the Roses, he fought on the Yorkist, the winning side, and three years later as lord-deputy of Calais and admiral of the fleet gained a splendid success over the Spaniards, but a quarrel between his followers and those of the king led to charges against him which resulted in his taking the field of Ludlow with his cousin, the Duke of York (1459). On being defeated, he withdrew to Calais, and thence in the following summer retreated to Kent, and, mastering London, brought about the compromise by which Henry VI. was to reign for life, but York was to be recognized as his successor. Thereupon Margaret of Anjou, routing and slaying York and Salisbury at Wakefield, advanced to St. Albans, where a second battle ended in Warwick's defeat. Warwick, however, joined the young Earl of March (now Duke of York), and boldly placed him on the throne as Edward IV., then chasing the Lancastrians back to Yorkshire, cut them to pieces on the field of Towton 29 March 1461. Warwick, however, bestowed his daughter on the Duke of Clarence, and after seizing on Edward's person, executing the queen's father and brother, entered upon a scheme for making Clarence king.

Failure drove him once more to France, where, through the mediation of Louis XI., he engaged to restore the crown to Henry VI., with the understanding that Margaret wed her son to Warwick's daughter Anne. His landing in Devonshire came like a clap of thunder to Edward IV., who from the North, where he was busy quelling a revolt, escaped to Burgundy, leaving Warwick master of the kingdom. Edward returned in six months' time, and Warwick with his brother was routed and slain at Barnet 14 April 1471.

Warwick, England, a market-town, capital of Warwickshire, on the right bank of the Avon, 90 miles northwest of London. The principal buildings are the Church of St. Mary, the Earl of Leicester's hospital for aged brethren, the shire-hall, jail, museum, endowed grammar school, east and west gates, etc. The chief manufacture is gelatine; and the trade in cattle, corn, and provisions is considerable. On the opposite bank of the river, crowning a solid rock, is the ancient and magnificent castle, the residence of the earls of Warwick. The date of the original erection is unknown. Caesar's Tower, the most ancient part of the structure, is 147 feet high; Guy's Tower, 128 feet high, was erected in 1304. The approach to the grand front exhibits three stupendous towers, and the entrance is flanked with embattled walls covered with ivy. It was partially destroyed by fire in 1871; but the most ancient portion remains uninjured.

Warwick, N. Y., village in Orange County; on the Wawayanda Creek, and on the Lehigh & Hudson River Railroad; about 30 miles southwest of Newburgh and 10 miles south of Goshen. It is in an agricultural region, and near by are iron mines and granite quarries. In the vicinity are the beautiful lakes, Glennere, Greenwood, Clark's, and Wawayanda. The manufacturing establishments are railroad shops, a foundry, creameries, and fabric-hose works. It has six churches, Warwick Institute, graded schools, and a school library. There are two banks; the national has a capital of \$100,000 and deposits \$267,920. The Warwick Savings bank has deposits amounting to over \$1,000,000. The village is a favorite summer resort. Pop. (1910) 2,318.

Warwick, R. I., town in Kent County; on the Pawtuxet and the Providence rivers, the Cowsett and Narragansett bays, and on the New York, New Haven & Hartford Railroad. It is 5 miles south of Providence. It has extensive manufacturing interests; the chief industrial establishments are cotton mills, flour and grist mills, foundry and machine shops, and blacksmith and wheelwright shops. The government census of 1900 gives the number of manufacturing 104, which were capitalized for \$2,418,333, and which had 5,544 employees, who received annually \$1,852,462. The raw material cost, each year, \$2,522,789, and the products were valued at \$6,197,506. The town includes several villages, in each one of which there are graded schools, and in some libraries. Warwick was settled in 1642 by a colony of 12 Englishmen, under the leadership of Samuel Gorton. The place was first called Shawomet; but in 1848 the name was changed by admirers of the Earl of Warwick. Massachusetts claimed control of the colony, and in 1643 one result of the contentions was that the place was nearly destroyed. Indians attacked the place several times, and, in 1676, burned a number of houses and wounded many of the defenders of the town. Nathaniel Greene (q.v.) was born in Warwick. Pop. 1890 17,761; (1900) 21,316; (1910 census) 26,629.

Wasco (wâ'skô) Indians ("grass," or "grass people"), a tribe of the Chinookan stock of North American Indians, also known as Dalles Indians and as Wascopums. They formerly claimed the country about The Dalles, on the south bank of Columbia River, in Wasco County, Oregon, therefore forming, with the Wushum or Tlagluit, the easternmost extension of the Chinookan stock. They were participants in the Wasco treaty of 1855 and are now on Warm Springs Reservation, Oregon. Pop. about 290.

Waseca, wâ-sê'kâ, Minn., city, county-seat of Waseca County; on Clear Lake, and on the Minneapolis & Saint Louis and the Chicago & Northwestern R.R.'s; about 60 miles south by west of Minneapolis and 25 miles south by east of Mankato. It is in an agricultural and stock-raising region. It has flour mills, creameries, and machine shops. The Minnesota Chautauqua holds its sessions on their grounds bordering on the lake, and adjoining the city. There are 12 churches, the Holy Child Jesus Academy, graded public schools, and a school library. Pop. (1910) 3,054.

WASH—WASHBURN

Wash, England, a wide estuary on the east coast, between the counties of Lincoln and Norfolk, 22 miles in length and 15 miles in average breadth. It is surrounded by low and marshy shores, and receives the Witham, Welland, Ouse, Nen and Nar rivers. The estuary for the most part is occupied by sandbanks, dry at low water, and intersected by channels through which the rivers flow into the North Sea. On both sides of the channel by which the Ouse falls into the sea considerable tracts of land have been reclaimed. Anchorage is afforded to vessels by two wide spaces or pools of water, called respectively Lynn Deep, opposite the Norfolk, and Boston Deep, off the Lincoln coast.

Wash Bottle, in analytical chemistry, an apparatus used for delivering a fine jet or stream of liquid on to a precipitate for the purpose of washing it, or for removing any residue of a solution or solid particles from one vessel to another. It consists of a flask of hard glass, fitted with a cork or india-rubber stopper perforated in two places. Through each perforation is passed a piece of bent glass tubing, one being carried to within half an inch of the bottom of the flask, and the portion of tubing outside drawn to a fine open point. The other tube is carried just within the bottle, and it is to the outer end of this that the lips are applied in blowing into the apparatus in order to expel the liquid contained in it.

Washburn, wôsh'bérn, Cadwallader Colden, American soldier, son of Israel Washburn (q.v.): b. Livermore, Maine, 22 April 1818; d. Eureka Springs, Ark., 14 May 1882. He studied law, was admitted to the bar in 1842, and engaged in practice at Mineral Point, Wis. He founded a bank there in 1852, dealt extensively in real estate, and in 1855-61 was a member of Congress. At the outbreak of the Civil War he organized a cavalry regiment, of which he was appointed colonel. He was engaged in the Arkansas campaign, received his commission as major-general of volunteers in 1862, participated in the movements around Vicksburg, and later was assigned to command the 13th Corps in the Department of the Gulf. He was transferred to Texas with a portion of his command in 1863, captured Fort Esperanza, 29 Nov. 1863, and in 1864 was placed in command of the district of West Tennessee. He was again member of Congress in 1867-71, was governor of Wisconsin in 1871-3, and subsequently engaged in lumber and flour manufacturing. He founded the Washburn Observatory at the University of Wisconsin.

Washburn, Charles Ames, son of Israel Washburn (1784-1876) (q.v.), American editor and diplomat: b. Livermore, Maine, 16 March 1822; d. New York 26 Jan. 1889. He was graduated at Bowdoin in 1848, went to California in 1850, entered journalism in San Francisco, and became editor and proprietor of the *Alta California*, the first newspaper on the Pacific coast to advocate the principles of the Republican party, of which he was one of the organizers in that State. From 1858 to 1861 he was editor and proprietor of the *San Francisco Daily Times*. In 1860 was chosen elector at large, and in the following year was appointed by President Lincoln minister to Paraguay, a post which he occupied for seven years, covering most of the

period of the war between that country and Brazil and her allies. In 1868, under the tyranny of Francisco Solano Lopez (q.v.) many foreigners, as well as Paraguayans, were put to death on an unfounded charge of conspiracy against the government, and Washburn, on account of his efforts to save the lives of his associates, was accused of complicity in the plot. His life was preserved through the intervention of a United States naval force, the gunboat *Wasp* taking him away from the country. Disagreement with certain naval officers grew out of these incidents, and the circumstances were investigated by the House Committee on Foreign Affairs. The result was Washburn's complete vindication. He published a 'History of Paraguay, with Notes of Personal Observations and Reminiscences of Diplomacy under Difficulties' (1871), giving a graphic account of these events; 'From Poverty to Competence'; 'Graduated Taxation'; 'Political Evolution'; and several novels. He was the inventor of a typograph and other mechanical devices.

Washburn, Emory, American jurist: b. Leicester, Mass., 14 Feb. 1800; d. Cambridge, Mass., 17 March 1877. He entered Dartmouth College, and from there went to Williams, where he was graduated in 1817. Admitted to the bar in 1821, he practised in Leicester until 1828, and for the next 30 years in Worcester. Having served in both branches of the Massachusetts legislature, in 1844 he became a justice of the court of common pleas, a position which he held three years. In 1854-5 he was governor of the State. From 1856 to 1876 he served as Bussey professor in the Harvard Law School. Besides lectures, pamphlets, etc., his legal publications include 'American Law of Real Property' (1860); and 'American Law of Easements and Servitudes' (1863).

Washburn, George, American educator: b. Middleboro, Mass., 1 March 1833. He was graduated from Amherst in 1855 and from Andover Theological Seminary in 1859. He was appointed professor of philosophy at Robert College, Constantinople, Turkey, in 1868; served as acting president there in 1870-7; and since the last named year has been president of the college. He is an authority on the politics of Southeastern Europe and in recognition of his services in behalf of Bulgarian liberty and the general elevation of the people he received from the first Bulgarian Parliament a vote of thanks, and in 1884 from the Prince of Bulgaria, the Order of Saint Alexander. He delivered an address on Mohammedism at the World's Parliament on Religions at Chicago in 1893, has been for 20 years a contributor to the London 'Contemporary Review,' and also to other English and American periodicals.

Washburn, Israel, American shipbuilder and trader: b. Raynham, Mass., 18 Nov. 1784; d. Livermore, Maine, 1 Sept. 1876. In 1806 he removed to Maine, then a part of Massachusetts, and having a population of about 200,000. Two years later at a place then called White's Landing (now Richmond), on the Kennebec River, he began shipbuilding in partnership with Barzillai White, and in 1809 established a trading-post at Livermore (now in Androscoggin County), where he soon after settled. He reared many children and several of

WASHBURN—WASHBURN COLLEGE

his sons rose to positions of distinction, making the family name conspicuous in American history.

Washburn, Israel, Jr., American lawyer and "War Governor," son of the preceding: b. Livermore, Maine, 6 June 1813; d. Philadelphia 12 May 1883. He studied law, was admitted to the bar in 1834, and in the same year settled at Orono, Maine, where he practised his profession continuously until 1850, when he was elected to Congress. He was four times re-elected, and became prominent among the anti-slavery members of the House in the critical period just before the Civil War. In 1860 he was elected governor of Maine. Re-elected in 1861, he declined a third election, and in 1863 accepted an appointment as collector of customs for the port of Portland, an office which he continued to hold until 1877. During his terms as governor he energetically supported the Federal government by raising, equipping and forwarding troops with a promptness which insured to Maine an honorable position among the States that upheld the Union cause, and placed his own name in the list of great "War Governors" of the period. In 1875 he was elected to the presidency of Tufts College, but declined the office. He published 'Notes, Historical, Descriptive, and Personal, of Livermore, Maine' (1874), and also contributed frequently to periodicals.

Washburn, Samuel Benjamin, American naval officer, son of Israel Washburn (1784-1876) (q.v.): b. Livermore, Maine, 1 Jan. 1824. He became a shipmaster in the merchant marine, and later engaged in the lumber trade in Wisconsin. During the Civil War he entered the United States naval service as a volunteer, and at the battle of Fort Darling won special commendation for skill and gallantry. Later he commanded a squadron and performed many valuable services for the government.

Washburn, William Drew, American legislator and manufacturer, son of Israel Washburn (q.v.): b. Livermore, Maine, 14 July 1831. He was graduated at Bowdoin in 1854, admitted to the bar in 1857, and in that year engaged in law practice in Minnesota. He was a member of the Minnesota legislature in 1859 and in 1871; was surveyor-general in 1861-5; served in Congress in 1870-85; and in 1880-95 was a United States senator. He engaged extensively in the lumber and flour industries, was one of the builders of the Minneapolis and Saint Louis railroad, of which he was president until 1889. He later became president of the Bismarck, Washburn and Great Falls Railroad Company.

Washburn, Maine, town in Aroostook County; on the Aroostook River; 50 miles north by west of Houlton. It is a distributing centre of considerable importance, although it is eight miles from a railroad station. It is a favorite summer resort. It has three churches, a high school, graded school, and public library. Pop. (1910) 1,582.

Washburn, Wis., city, county-seat of Bayfield County; on Lake Superior, and on the Northern Pacific and the Chicago, St. P., M. & O. R.R.'s; about 50 miles east of Superior, and 200 miles northeast of Minneapolis, Minn. In 1665 a Jesuit mission was established in the place now occupied by the city. Washburn's

first permanent settlement was made in 1883, and in 1884 it was incorporated. In the vicinity are brownstone quarries, and in the forests there is considerable lumbering. There are nearly 2,000 employees in the industrial establishments. Washburn ships large quantities of stone, lumber, and grain; and distributes to the lumber camps and the towns and hamlets of the vicinity general merchandise. There are several church buildings, the county court-house, which cost \$50,000, and several good business blocks. The educational institutions are the Walker High School, founded in 1889 (building cost \$40,000), three graded schools, one large Roman Catholic parish school, and a school library. The two banks have a combined capital of \$50,000. The majority of the inhabitants are Scandinavians. Pop. (1910) 3,830.

FRED T. YATES,
Editor 'News.'

Washburn College, located at Topeka, Kan. It was founded in 1865 by the General Association of the Congregationalists of Kansas, but is non-sectarian in policy and government. It was first called Lincoln College, and the name changed in honor of Ichabod Washburn of Worcester, Mass., who gave the college \$25,000. The college is co-educational. The course of study was at first not above the academic grade, but was soon expanded to a full college course, and other departments added until the college now includes five departments: (1) the College; (2) the School of Medicine, founded as the Kansas Medical College in 1890 and made a department of Washburn in 1902; (3) the School of Law, opened in 1903; (4) the School of Fine Arts; (5) the Washburn Academy. The college confers the degrees of B.A. and B.S. for the completion of a four years' course, and the degrees of M.A. and M.S. for graduate work. For the bachelor degrees the course in the first two years is partially prescribed and partially elective, for the last two years entirely elective; the electives for the Junior and Senior years are divided into three groups, (1) language and literature, (2) mathematics and science, (3) history, philosophy, and social science. One of these groups must be elected as a major department, candidates for the B.S. degree must elect the mathematic and science group. Biblical literature, Hebrew, and pedagogical courses are included in the curriculum. The School of Medicine offers a four years' course leading to the degree of M.D., it is the only school in the State associated with the American Association of Medical Colleges. The School of Law offers a three years' course and confers the degree of LL.B. The School of Fine Arts was organized as a separate school in 1902, music and art departments having been established some years before. This school includes the departments of music, drawing, and painting (including the Reid-Stone School of Art), and oratory. The music department offers four years' collegiate courses in pianoforte, organ, violin, and vocal culture, leading to the degree of bachelor of music; and a two year normal course for public school teachers; there are also four years' courses in drawing and painting leading to the degree of bachelor of painting, and in oratory leading to the degree of bachelor of oratory. The students maintain four literary societies, two for men

WASHBURN — WASHINGTON

and two for women, an oratorical association, Christian associations, and an athletic association. In addition to the intercollegiate sports in which the college participates, an annual college field-day has been inaugurated. The college occupies a campus of 160 acres just outside the city on elevated ground; the buildings include Rice Hall (originally Science Hall, the name being changed in 1902), Whitin Hall, the observatory building (erected in 1903 for the departments of physics and astronomy), the MacVicar chapel, the Boswell Memorial Library, Hartford Cottage and Holbrook Hall (women's dormitories). In 1904 a new library building, the gift of Andrew Carnegie, was in process of construction. The library in 1910 contained 18,000 volumes; in addition the schools of law and medicine have separate libraries; and the Topeka Public, the Kansas State, the Kansas State Historical Society, and the Academy of Science libraries are open to students. In 1910 the students numbered 811. They were about evenly divided between the regular college, the School of Fine Arts, and the School of Medicine.

Washburne, Elihu Benjamin, American diplomat, son of Israel Washburn (q.v.): b. Livermore, Maine, 23 Sept. 1816; d. Chicago, Ill., 22 Oct. 1887. He was educated at Harvard, admitted to the bar in 1840, and engaged in practice at Galena, Ill. He was a member of Congress from 1852-59, when he was appointed secretary of state by President Grant, an office he soon afterward resigned in order to become minister plenipotentiary to France. He was the only foreign minister to remain at his post in Paris throughout the Franco-Prussian war, and the American legation became a refuge for Germans and other foreigners unable to leave the city during the siege of the city and the period of the Commune. His firmness in his course won the gratitude of the European governments and he was granted special honors by the German emperor and Bismarck, as well as by the French leaders, Gambetta and Thiers. He returned home in 1880. He published 'Recollections of a Minister to France' (1887).

Washing of Feet. See **FEST WASHING**.

Washing Machine, a machine for washing clothes. A great number of machines have been contrived, the most general feature of them being that the clothes are agitated by artificial means in a vessel or trough containing the cleansing agents. One of the great advantages of the washing-machine as compared with the hands is, that the water can be used when boiling hot. In some, provision is made for retaining the steam, which effectually bleaches the clothes, and they generally have also roller attachments for wringing and mangling.

Washington, wōsh'ing-tōn, **Booker T. Washington**, American negro educator: b. near Hale's Ford, Franklin County, Va., about 1858. After the Civil War he went to Malden, W. Va., where he worked first in a salt-furnace and afterward in a coal-mine, obtained some rudiments of education in a night-school there, and finally after many difficulties, recounted in the autobiography 'Up from Slavery' (1901), got to the Hampton Normal and Agricultural Institute (Va.) (q.v.), where he studied in 1872-5. After a two-years' interval of teaching at Malden, he obtained further training at

the Wayland Seminary (Washington, D. C.), and in 1879 was made an instructor at Hampton. He had charge of the work of the Indian pupils then being experimentally introduced into the institution, and established the night-school as a regular and successful feature of the institute. In 1881 he was selected by General S. C. Armstrong of Hampton on the application of citizens of Tuskegee, Ala., to start in that place an institution on the plan of Hampton. The State legislature granted an appropriation of \$2,000 annually for the salaries of the teaching force, but the Tuskegee Normal and Industrial Institute (q.v.) then existed in name only, without land, buildings, or credit. Washington, with himself as the only instructor, opened the school with an enrollment of 30 in an old church and a shanty. Later he purchased a plantation about a mile from Tuskegee, and removed the school thither to its present site. In 1902 the institution had 112 officers and instructors, 1,384 students, and an income of \$341,000. Its development was due chiefly to the activity of Washington in bringing the nature and merits of the work to public attention, and the originality and effectiveness of his methods. He has aimed to give the blacks a practical education along lines of trade and industry, leading to an ultimate position of economic independence in the South. If this were attained, he asserted, political rights now denied would not long be withheld. He became well known as a forceful public speaker, his most noteworthy address probably being that given in 1895 at the opening of the Cotton States and International Exposition in Atlanta, Ga. He organized the National Negro Business League at Boston in 1900. Among his writings are: 'The Future of the American Negro' (1899); 'Up from Slavery' (1901), the interesting autobiographical narrative referred to above; and 'Character-Building' (1902), collected addresses to pupils of Tuskegee. Consult further M. B. Thrasher, 'Tuskegee' (1900), to which Washington contributes an introduction; and an article by W. D. Howells in the 'North American Review,' Vol. 173, pp. 280-8 (1901).

Washington, Bushrod, American jurist: b. Westmoreland County, Va., 5 June 1762; d. Philadelphia 26 Nov. 1829. He was nephew of George Washington. Graduated in 1778 from the College of William and Mary; he studied law with James Wilson (1742-98) (q.v.) at Philadelphia, and practised in Westmoreland County with much success. From 1780 until the surrender at Yorktown, he served in Colonel Mercer's cavalry troop; in 1787 became a member of the Virginia house of delegates; and in 1788 of the Virginia convention for ratification of the Constitution of the United States. In December 1798 he was appointed an associate justice of the United States Supreme Court. He was the first president of the American Colonization Society. (See **COLONIZATION SOCIETY OF AMERICA**, **THE NATIONAL**.) Among his publications are: 'Reports of Cases in the Court of Appeals of Virginia' (1798-9); 'Reports of Cases Determined in the Circuit Court of the United States for the 3d Circuit, 1803-27' (edited by R. Peters, 1826-9). Consult Binney, 'Life' (1858).

Washington, George, American soldier-statesman, and first President of the United

From the Painting by Stuart.

GEORGE WASHINGTON.

WASHINGTON

States: b. 22 Feb. 1732 in the family homestead at Bridges Creek, in Westmoreland County, Va. He was the fifth child of Augustine Washington, who belonged to the third generation of Washingtons who had lived in America. Augustine was a well-to-do planter who might have afforded every school advantage to his son had he not died before George was 12 years of age. The father's death left the son in his mother's care, with a farm on the Rappahannock as his sole inheritance. This precluded any hope of an education in England such as his elder brothers had enjoyed, and he, therefore, received the practical and elementary instruction afforded in colonial Virginia. He learned something in books but more about the forest life, and manly sports, and the habits of a Virginia gentleman. Formal schooling he quit altogether at the age of 16, and began surveying in the employment of Lord Fairfax, an Englishman who came to Virginia to look after his inherited lands, and whose companionship taught Washington some of the conduct and breeding of a man of the world. Though Washington was a mere boy and almost self-taught in surveying, yet he was a good woodsman, and he did his work so well on Lord Fairfax's forest lands that for three years he was kept busy at the profession, which in that day approached nearer to woodcraft than expert mathematics. Meanwhile he did not neglect to give considerable time to the study of military tactics and the manual of arms, for which a Virginian of his standing might have use. This life came to an end in 1751, when the failing health of his elder brother Lawrence caused him to seek recuperation in the Bahamas. Thither George went with him, only to bring him back to die. As executor of his brother's will, he assumed so many cares that his surveying profession had to be abandoned altogether.

Before Lawrence's death he had given George his place in the Virginia militia, and in 1752 Lieut. Gov. Dinwiddie gave the popular young soldier a commission as major and adjutant-general in charge of one of the four military districts of the State. Hardly was he in charge of his new office when a movement of the French to insure their control of the region between the Mississippi and the Alleghenies made war between the French and English in America almost inevitable. From Canada the French had sent 1,500 men to Presque Isle on Lake Erie to erect a fort, intending thence to push through the forest to the Allegheny River and down it to the Ohio. There they would drive out the English, who were beginning to push into that region.

Gov. Dinwiddie saw the danger and, after getting authorization from England, he selected Maj. Washington for a dangerous midwinter journey through the forest to the French fort, to command them to depart and not to trespass upon England's claims. The hardy young surveyor made the terrible journey only to be given the hint that the French had come to stay. Upon his return, the Virginia assembly was persuaded to furnish funds for a force to be sent against the invaders. Washington was made lieutenant colonel, and under Col. Fry set out to resist the French advance. Fry died on the march, and Washington bore the brunt of the enterprise. A rough and ready fort built

by an advance party of backwoodsmen near the junction of the Ohio and the Allegheny was taken by the French, who thereupon built Fort Duquesne and awaited the Virginians. In that neighborhood, at Great Meadows, Washington camped. A skirmish took place in which a small body of French under Jumonville were defeated, and then the defenses, which Washington had built and called Fort Necessity, were attacked, 3 July 1754, by superior French forces. A wretched day of fighting in the rain was followed by a parley, at which Washington sensibly agreed to withdraw from a hopeless conflict. Upon his return to Virginia he was unfairly reduced in rank, and indignantly resigned his commission.

The war for the possession of America was now taken up by the home government. England sent the headstrong Gen. Braddock to help the English colonists to drive out the French. Upon his arrival in Virginia he made the acquaintance of Washington and offered to make him a member of his staff—an offer which was eagerly accepted. Braddock did not realize the difficulties of forest warfare, and without heeding some of the wise counsel given him by Americans, he pushed toward Fort Duquesne with 2,000 regulars brought from England and some provincial recruits. Eight miles from the French fort, he was attacked by an unseen enemy, and the terrified regulars were held in solid ranks to be shot down until sheer fright made them break into retreat. Braddock was mortally wounded, and it was left to Washington to conduct the retreat. After he had led the shattered forces back to Virginia, he became for a time the chief stay of his province in guarding her frontiers against the savages, until, in 1758, he was sent with the British General Forbes again to attempt the capture of Fort Duquesne, and this time success crowned the effort. Then Quebec fell, and England's power in America was firmly established.

When England and her colonies quarreled, Washington took an early and decided part in asserting and defending the colonial rights, though with other American leaders he long looked and hoped for conciliation. To him the Stamp Act was "a direful attack on the liberties of the colonists." In 1769 he thought something must be done "to maintain the liberty which we have derived from our ancestors." He approved of awakening English attention to American rights "by starving their trade and manufactures," and as a member of the Virginia assembly he presented a non-importation agreement, and secured its passage. He was present and gave his support, in 1773, to the resolves instituting a committee of correspondence, and in 1774 he favored the proposed general congress at Philadelphia. On 1 Aug. 1774 the convention met which elected him, with six others, delegates to the first Continental Congress, where he was in the opinion of Patrick Henry "unquestionably the greatest man on the floor," as far as solid information and sound judgment were concerned. When the second Continental Congress met, 10 May 1775, he was again a member, but he was not long to remain there.

After 10 long years of growing irritation between England and America the first blow had been struck. The enraged farmers had followed the intruding British from Concord and

Lexington to the very defenses of Boston, and then with their numbers ever-increasing they settled down in a great half-circle around the town with the purpose of driving Gage, the British commander, into his ships. Everything was in confusion and men came and went much as they chose, kept to their task only by the efforts of a few natural leaders. When the men of New Hampshire and Rhode Island and Connecticut came, not even the fanatic zeal of the siege could banish the provincial jealousies. It was plain to all that there could be no great thing accomplished without a strong leader, one who would make men forget, for a time at least, the most prominent fact in colonial life—the jealous love that every man had for his own colony.

The Continental Congress was forced after a month of hesitation to assume the army before Boston as the "Continental Army." As a commander-in-chief they needed a man who could by his personal influence draw the southern and middle colonies into the struggle which New England had thus far made alone. In this critical moment John Adams saw the wisdom of binding the South to New England's fortunes by choosing a Virginian to lead her army. Local prejudice would have chosen John Hancock, who was bitterly chagrined that he missed the office. At Adams' suggestion the choice fell upon Col. George Washington, who every day since the session began had sat in Congress in his uniform.

The new commander-in-chief was a physical giant, over six feet, and of well-proportioned weight. His composed and dignified manner, and his majestic walk marked him an aristocrat and a masterful man. This character was heightened by a well-shaped, though not large, head set on a superb neck. His blue-gray eyes, though penetrating, were heavy-browed and widely separated, suggesting a slow and sure mind rather than wit, and brilliant imagination. Passion and patience, nicely balanced, appeared in the regular, placid features, with the face muscles under perfect control. A resolutely closed mouth and a firm chin told of the perfect moral and physical courage. His clear, pale, and colorless skin never flushed in the greatest emotion, though his face then became flexible and expressive. Mentally, the directive faculties were the more marked. He had been but half-educated, with no culture except that coming of good companionship. From that he had learned rather the tastes of a country gentleman, courtesy, hospitality, and a love of sport. The soundness of his judgment and the solidity of his information were the notable qualities. He had little legal learning and was too shy and diffident for effective speech. His eloquence was the eloquence of battle. It had the note of challenge, and the gesture of chivalry when it threw down the gage of mortal combat. "I will raise one thousand men," he said in 1775, "at my own expense, and march myself at their head for the relief of Boston." Of original statesmanship he had little, but he had "common sense lifted to the level of genius." Believing in a course, he followed it, single-minded, just, firm, and patient. No rash action or personal caprice was ever charged to him. He was able to bear great responsibility, and courageously to meet unpopularity and misrepresentation. There was no flaw in his devotion. He was

"often anxious, but never despondent." "Defeat is only a reason for exertion," he wrote. "We shall do better next time." This spirit, and his gift for military administration, were the winning traits in the years to come.

On the day before the Continental army fought at Bunker Hill, 16 June 1775, Washington accepted the command in his modest way, refusing to accept any pay for his services, except his actual expenses. To his wife, the one person to whom he would lay bare his heart, he wrote: "I assure you in the most solemn manner that so far from seeking this appointment, I have used every endeavor in my power to avoid it . . . from a consciousness of its being a trust too great for my capacity." "A kind of destiny" had thrown him into this service, and he could not refuse.

Upon his arrival at Boston, 2 July, Washington found his army an armed mob. They had done creditable things, but in a blundering, unmilitary way. Rude lines of fortifications extended around Boston, but they were executed with crude tools and without competent engineers. A few officers were looking after the commissary department, but there was no head. No able officer looked after the recruiting and mustering service, or the barracks or hospital, and there was only a haphazard method of paying the soldiers. There was no uniform, and the very differences in costume augmented the colonial jealousies and self-consciousness. All that distinguishes a well-drilled and equipped army from a mob was wanting; yet here was the weapon with which Washington was expected to defeat the armies of the most powerful nation of the world. Only by the exercise of all his gifts as an administrator did he get even the semblance of an army. His own great care for details, his method and punctuality had their effect upon others, and, though there was malingering, desertion, and petty mutinies, the enemy never knew that the army before Boston was often on the point of dissolution. When, in December, the terms of enlistment ran out, Washington even succeeded, as he said, in disbanding one army and raising another within cannon shot of the enemy. Then early in March 1776 he made an adroit move, seized Dorchester Heights, and left the British nothing to do but evacuate Boston in the utmost haste.

The American leader had scored his first triumph, and, that assured, he hastened with his army to New York, where, it was shrewdly judged, the British would strike next. Congress urged him to hold the city at all hazards, and contrary to his better sense, he attempted the impossible. Without the control of the sea, New York, on its narrow strip of land thrust far down between two navigable waters, was a deadly trap. A military genius would have refused the risk, but Washington ventured it, half believing for a time that he might succeed. He placed his army in a position where every probability pointed to defeat, followed by almost certain capture or destruction. Had Howe not taken such tender care of his enemy's safety, all might have ended there. Washington was able to withdraw from Brooklyn, 30 Aug. 1776, after the defeat on Long Island, and then to evacuate New York and get behind the Harlem, because, as an English critic said, Howe calculated with the greatest accuracy the

MARTHA WASHINGTON.

WASHINGTON

exact time necessary to allow his enemy to escape. The unbounded confidence of Washington's countrymen had proved too much on this occasion for even his steady judgment, and in response to their enthusiasm he had tried to hold a position and defend a place for which his resources were inadequate. He had become for the moment a source of danger to the Americans because they did not understand his real greatness.

Washington realized keenly his own lack of military experience on a large scale—he had no heaven-born genius, and he knew it. The skill that he finally attained was that which a strong-brained, sensible man would get in any vocation which he plied industriously, and to which he gave his heart. Washington learned as he fought, and his early errors with the consequent disaster, grew steadily less, until, as a master of his profession, he issued from the war without a peer and almost beyond the reach of envy. Yet not even his ultimate military greatness explains his real service to his countrymen. It was the confidence that Washington inspired as a man, rather than his great genius as a soldier, which made him the only man in America who could carry the Revolution to a successful issue.

After losing New York Washington fought step by step, as he retreated, repulsing the British at Harlem Heights and holding his own at White Plains, 28 Oct. 1776, but the meddling of Congress cost him some 3,000 men captured in Fort Mifflin, and then there was nothing for him but a retreat from the Hudson through New Jersey. This was not the only time that the democratic faction in Congress forced their military plans upon their commander-in-chief. He was much hampered at first by Congressional interference in his military plans, but he soon won the limitless faith of these democratic enthusiasts, conquering all their fear of military despotism and gaining in the disposal of his own army the supremacy of a Frederick or a Gustavus Adolphus.

As the American army fell back mile after mile the character of the leader was tested to its utmost. His generals grew insubordinate, his men deserted by whole companies, throughout the Jerseys thousands took oath of allegiance to George III, and everywhere there were murmurs of discontent with this sort of a campaign. Then it was seen that Washington's courage was not mere disregard of danger, but the sort that long endures uncertainty and never shrinks from responsibility, bearing in silence temporary unpopularity or exasperating misrepresentation.

When the army at last crossed the Delaware the roll-call would muster but 3,000 men. Straining his powers to the furthest bounds, Washington kept this force together, and added as many more. Concerning some of his extraordinary measures, Washington wrote Congress: "A character to lose, an estate to forfeit, the inestimable blessing of liberty at stake, and a life devoted must be my excuse." Before the holidays he was ready to strike a blow for liberty, and to sustain his character. Crossing the Delaware, 25 Dec. 1776, in spite of pitchy darkness and grinding ice, he marched through a sleeting storm nine miles to Trenton. The Hessians there were surprised and driven to surrender. Some 900 prisoners were taken

to the other side of the river, and then Washington crossed again to win another victory at Princeton. The whole situation was changed. The wretched retreat was forgotten or regarded as only the prelude to the startling and brilliant victories. In England, Walpole declared that Washington was both a Fabius and a Camillus. His whole campaign got a new color because of its issue. In the Russian court, in Frederick's cabinet, and in the aristocratic circles of Paris, Madrid, and Vienna the campaign was praised as if the end had been in Washington's view from the first. The victories made Washington's military reputation rest on something tangible, to which men might point. Mere faith such as the Americans had shown heretofore had little effect on foreign critics. The European soldiers grew more interested, and their favorable opinion had vast influence in winning foreign aid. Washington had been so consistently patient and brave in adversity, so silent under unjust criticism, never talking down his mistakes, or glossing his errors, that the hour of victory brought its ten-fold reward in sympathy and confidence. He had quietly assumed so much obloquy that any stint of his praise seemed unjust and ungenerous. The victories renewed American confidence in their leader, and from that time on whatever there was of unity for political or military purposes among the 13 States came of the common faith in Washington.

Congress now put its whole trust in him—until a temporary reverse put him again in the shadow of its distrust. It provided for long enlistments to take the place of the evanescent three months' levies that had ruined Washington's army heretofore, just as he had it drilled. He was made a veritable dictator as to all that might affect the success of the army, its discipline, and its supplies. It was well that the commander-in-chief had made this brilliant stroke, which appealed to all those who saw only the surface of the Revolution. For 18 months thereafter nothing but reverse and misfortune and terrible trial fell to the leader's lot. While Gates was gathering unearned laurels at Saratoga, and the American cause was vastly advanced by Burgoyne's defeat and the consequent French alliance—while others were getting glory and significant victories, Washington was maneuvering with Howe, always refusing battle, or, as at Brandywine Creek, 11 Sept. 1777, and Germantown, 4 Oct. 1777, meeting defeat. To the superficial observer there was only failure for Washington and success for his rivals. There seemed no great work in merely keeping an army together, delaying Howe and keeping him from going north to Burgoyne's rescue. When, at last, the British settled down cosily in the "rebel capital"—when Philadelphia had taken Howe, as Franklin so cleverly expressed it—Washington encamped at Valley Forge, 19 Dec. 1777, his popularity waning at the very moment when he began to render his greatest service to his country. There, in the most trying hour, he continued to do what had been his greatest task from the first. In spite of jealous States and a wrangling Congress, and while deprived of all that source of power which a strong government gives to a commander, Washington kept together a starved and suffering army by his personal firmness, patience, and judicious handling of men.

WASHINGTON

While the burden of his trial was greatest there grew up in Congress an ugly scheme to put Gates in Washington's place. From the first there had been intrigue among the officers. "I am wearied to death," John Adams wrote, after a visit to the army, "with the wrangles between military officers high and low. They quarrel like cats and dogs. They worry one another like mastiffs, scrambling for rank and pay like apes for nuts." Amid this Washington had lived disturbed, but not concerned for himself. Now Congress was implicated in the plotting. Some were impatient with the Fabian policy, and, like Adams, wanted "a short and violent war." A conceited or vain man would have resigned and let the whole cause go to perdition as a vindication of himself, but Washington was nobler than that. Throughout the Revolution he kept the same spirit that animated him in the earlier years of border fighting. Then he had declared: "I could offer myself a willing sacrifice to the butchering enemy, provided that would contribute to the people's ease." He could "die by inches to save a people." During the Revolution he risked reputation, sacrificed popularity, suffered in mind and heart all that he had been willing to suffer in body to "save a people." Now he silently watched the plot ripen, and at the right moment exposed it with a royal contempt that quite crushed the plotters.

When the winter was gone there came the news of the French alliance. A fleet from France was menacing the British army in Philadelphia, and orders came for the evacuation of the city. They began a march toward New York across New Jersey. At Monmouth, 28 June 1778, the American army fell upon them, and, but for the cowardly or traitorous conduct of Gen. Lee, nothing but the fragments of the English army would have reached its destination. In that moment men saw what a tempestuous nature Washington habitually held in check. He stopped the retreat that Lee had unaccountably ordered, and in ungoverned rage cursed him for a coward. The troops were rallied, and they successfully engaged the enemy, but the moment for victory had been lost. The British reached New York in safety and Washington took a post on the Hudson.

Now came the supreme test that proved the American leader's unrivaled fitness for the work that he had to do. For three years, while Congress was helpless, unable to tax or get aid from the States, while it paid the soldiers in paper, so valueless that the pay of a colonel would not purchase oats for his horse, while nothing but a forced levy would secure food for the army, when a hundred men a month went over to the enemy in sheer desperation with suffering for food and clothing, while the great country that had so much at stake seemed absolutely indifferent—in the midst of blank despair Washington kept his heart and his purpose. Again and again he was disappointed by the failure of the promised aid from France—the naval aid that would prevent the British escape by sea if they were worsted on land. At last, however, the moment came when De Grasse with a French fleet held a temporary control of the sea, and Lafayette had pushed Cornwallis out on the peninsula at Yorktown. A few days' hesitation would have lost the opportunity, but the man who had waited three

years knew the moment for action when he saw it. Making a feint that deceived the enemy at New York, he got well on the way before his aim was guessed. For 400 miles he urged his eager army, and brought 6,000 men to Lafayette's aid at just the hour to render Cornwallis' escape impossible. The siege that then began could have but one end as long as De Grasse controlled the sea. The British surrendered, 19 Oct. 1781, and the war was ended.

As men looked back over the years of strife, they saw clearly that the greatest factor in the final success of the Revolution was the personal leadership of Washington. If we seek to explain it, it was not his great mind, for Franklin's was greater; not his force, energy, or ingenuity, for Benedict Arnold surpassed him in these qualities, not his military experience, for Charles Lee's was far more extensive; but it was the strength of character which day by day won the love of his soldiers and the perfect confidence of his countrymen. The absence of a mean ambition, the one desire of serving well his country and his fellow men, the faithfulness that could not be driven from its task through jealousy or resentment—these were the traits that gave him a unique and solitary place among the world's heroes.

Washington's service to his country was not to end with Yorktown. As he had been "first in war," because he was most fitted, so his unique character and pre-eminent place in American hearts fated him to become "first in peace." His last successes had still more firmly fixed his power among the people. Their thoughts and imaginations were filled with him. But they had not even yet seen the sublimity of his character. With a discontented and insubordinate army still in arms and with no real government in existence, Washington was the only source of authority and law that had anything more than a local influence. The weak Union might have at once lost all cohesion, and America might have degenerated into a number of petty, feeble, and hostile States. Worse than that the hopes for an American republic might have been indefinitely delayed, for, in the despair which settled upon many, there seemed but one escape from the political storm that threatened—they would make Washington king. In the army this plan was gravely considered, but when broached to Washington, he expressed himself as pained that such ideas existed in the army. "I am much at a loss to conceive what part of my conduct could have given encouragement to an address which to me seems big with the greatest mischiefs that can befall my country." To nobody could such a thought be more disagreeable, he declared earnestly. "Let me conjure you, if you have any regard for your country, concern for yourself or posterity, or respect for me, to banish these thoughts from your mind."

When the country seemed indifferent to the deserts of the army, when there was talk of disbanding it without provision for the future or even pay for what it had done, and when as a natural result there was mutiny and threat that the army would take government into its own hands—then it was Washington who tirelessly urged upon Congress and upon the States the justice of the soldiers' claims. Though he longed to go back to his home and to have his work done, yet he waited through

months of weariness until the British really left the country, and until the proper laws at least had been made to insure the soldiers' rights. Then at last, he stood among his officers at Fraunce's Tavern, bidding them to take him by the hand, while he gave them each and all the warm-hearted farewell that so fittingly ended their long years of trial and companionship.

For a brief time Washington now became "a private citizen on the banks of the Potomac"

"free from the burles of a camp and the busy scenes of public life," planning as he said to "move gently down the stream of time until I sleep with my fathers." He did not see in this happy hour that his past services had but devoted him to further service, and that he had become "the focus of political intelligence for the New World." Even before resigning his leadership he had urged the States to put faction and jealousy away and make "an indissoluble union under one federal head." As the affairs of the confederation became more and more deranged, and America, "like a young heir," as Washington wrote, wanted and ran riot until its reputation was brought to the brink of ruin, their great leader warned them that it was in the choice of the States and depended upon their conduct, whether they would be respectable and prosperous, or contemptible and miserable as a nation.

The politically starved Congress grew daily weaker. It could not even persuade the States to carry out the terms of the treaty of peace or pay their debts to foreign countries. Congress was despised at home, and America was disgraced abroad. The world looked on to see the confederation go to pieces. Within the individual States the mob seemed to have gained control and the law-giving bodies abandoned themselves to paper money and other economic vagaries. There was quarreling over State boundaries and commercial restrictions, one State against another, until thoughtful men like Washington urged that, if they were not a united people, they should no longer act the farce of pretending it. At last, however, his own endeavors united with others brought about a convention of the States, and that led to another which met at last in May of 1787, at Philadelphia, destined, if not purposed, to give America a new and stronger frame of government. To that convention Washington reluctantly came. He thought himself a soldier but no statesman. When at last he was persuaded that the chief hope for success must come from his approval, and that his mere presence would lend dignity and power to the convention, he yielded. As the delegates slowly assembled, he grew eager for the success of the work, and would listen to no half-way measures. "Let us raise a standard to which the wise and the honest can repair," he said to those who talked of a weak plan. When the work began he was chosen president of the convention, and, though he was no parliamentarian, his prominent place lent gravity and steadiness to the business.

After the Constitution was completed, and when it was before the country for approval, Washington had never been seen so eager for anything as for the adoption of the new scheme of government. It was only by active letter-writing that he used his influence, however, for the work of the politicians was out of character for him. The final success was very grate-

ful to him, but, when the new government was being set up, and the whole country turned to him as their choice for President, he held back, diffident and reluctant. He yielded at last because, as Hamilton represented to him, "In a matter so essential to the well-being of society as the prosperity of a newly instituted government, a citizen of so much consequence as yourself to its success has no option but to lend his services."

His was a noble figure to stand in the forefront of a nation's history. His simple manner well graced a republic, and yet there was a gravity and a lofty courtesy that lent dignity to democratic forms. His own self-mastery was a living lesson to democracy with its ill-repute for turbulence. No more fitting ideal of manhood could have been chosen for a new republic. It is, indeed, creditable to the men of that day that they were won by a character so unpretentious.

The political leadership was very unattractive to Washington. When the formality of election was over, he went to the seat of government with "feelings not unlike those of a culprit who is going to the place of execution." He bade adieu to private life and to domestic felicity, going to his new duties with resolution, but anticipating no joy in them. On his way the demonstrations of the people only filled him with forebodings. "The decorations of the ships, the roar of the cannon, and the loud acclamations of the people which rent the skies as I walked along the streets, filled my mind with sensations as painful as they are pleasant." After he had sworn, 30 April 1789, in the open balcony of the Federal Hall, that he would faithfully execute the office of President of the United States, he read his address in the Senate Chamber. "The magnitude and difficulty of the trust," he protested once more, "could not but overwhelm with despondence one who, inheriting inferior endowments from nature, and unpractised in the duties of civil administration, ought to be peculiarly conscious of his own deficiencies."

He realized keenly from the first that he walked "on untrodden ground." Scarcely any part of his conduct might not thereafter be drawn into precedent. There must not be a government only, but a body of public opinion that would uphold it. Governmental action must be mixed of firmness, prudence, and conciliation, said Washington, if it would win liking and loyalty as well as respect. He resolved to give it every proper form of dignity, ceremony, and prestige that would appeal to the imagination of the people. Men must see that it was a real government, supreme in the land. To this end he adopted forms that some thought stiff, some unrepugnant, but which all were soon taught to respect. "If there are rules of proceeding," he wisely concluded, "which have originated from the wisdom of statesmen, and are sanctioned by the common assent of nations, it would not be prudent for a young State to dispense with them altogether."

It was not by this conservatism alone that he gave strength to the new government, but by that unerring judgment which led him to choose men like Hamilton, Knox, Jefferson, and Randolph, and then to take for his guide Hamilton, the greatest of these for the present needs of the government. Natural leader as Wash-

ington was, he recognized the gifts and talents of others, and gave to each the task for which he was fitted. Hamilton's genius in affairs had not been in just the lines along which he was now to act, but his bold and original mind Washington saw to be a fit instrument to set the new government on a strong foundation. Hamilton quickly demonstrated the wisdom of the President's choice. He funded the public debt and established confidence in the nation's honesty. He prevailed upon Congress to assume the State debts and thus transferred the interest of creditors to the central government. A bank of the United States was created at his call, the "implied powers" of the Constitution being thus brought to the support of a strong government, and the commercial classes won by this attention to their interests. He was enabled to do these things successfully because he had the strong will of Washington with him. The fiscal measures had been made the President's own, because he was convinced that they were right, not merely that they were expedient. The end that was sought was the purpose that Washington held from the first, a strong and righteous government.

Hardly had things been set aright in the new nation's household than there came disturbing forces from abroad. The French people had gone upon a wild quest for liberty that threatened to turn the world upside down. The madness spread even to America—or rather seemed to leap by a strong attraction straight to America's democratic shores. France was soon fighting the conservative world, and what was more fitting than that liberal America should come to her aid? A French agent hastened to America to ask the people that very question. Washington determined that America, herself but "in a convalescent state," should not be drawn into the European struggle. She was too provincial at the best, too interested in European opinion and politics, and too oblivious of her own nationality. "I want an American character," the wise President declared, "that the powers of Europe may be convinced we act for ourselves, and not for others." He would avoid their disputes and their politics, and he purposed "if they will harass one another, to avail ourselves of the neutral conduct we have adopted." Washington, with a few others, stood almost alone in the advocacy of statesmanship rather than sentiment. In a few months, however, the public eyes were able to see more clearly, and the administration got the support that it deserved. The demands of the French revolutionary government were refused, and the President issued a proclamation of neutrality.

Meanwhile the country had learned that the new central government proposed to enforce its laws even within State boundaries. The rebellion in the back counties of Pennsylvania was quelled by the strong action of the central power. There could be no return to the time when there was no power but that of an individual State. The national government was expected thereafter to make itself felt directly upon the individual, and men began to look to it therefore in awe and reverence.

A second time Washington consented to hold the reins of power, and again, as in the Revolution, he felt the bitterness of unpopularity. All the honor that he had gained could not protect him from the hasty wrath of a people dissatis-

fied with his policy toward England. Because he strove for peace he was roundly abused in terms scarcely suited "to a Nero, a notorious defaulter, or even a common pickpocket." It saddened but did not change him. He was only the more unwilling to serve another term, and, when his eight years of civil service ended, he said farewell to the people he had served through a generation. He gave them the simple advice that they most needed. Tears coursed down his cheeks as he turned for the last time from the throng that had listened to him in love and sorrow. Three years he lingered in retirement at Mount Vernon, and then died, 14 Dec. 1799, as he had wished to live "amid the mild concerns of ordinary life."

CLAUDE HALSTEAD VAN TYN,
Professor of American History, University of Michigan.

Washington, the "Evergreen State," admitted to the Union, 22 Feb. 1889, is bounded on the north by the Strait of Juan de Fuca and British Columbia, on the east by Idaho, on the south by Oregon, and on the west by the Pacific Ocean. Capital, Olympia. Area, 69,180 square miles (land 56,880, water, 2,300). Population (1900) 518,103; according to the 1910 census, 1,141,990.

Topography.—Washington is divided into two distinct sections by the continuous range of the Cascade Mountains, extending clear across the State from north to south. These sections are known as eastern and western Washington. The eastern section contains about three fifths of the land area of the State and the western section about two fifths. In its physical features the State is characterized by a great diversity of topography, ranging from low plains, a few feet above the sea-level, to snow-covered mountains, several of which exceed 10,000 feet in height, together with broad, rolling prairies, elevated plateaus, deep cañons and fertile valleys. This great diversity of topography presents ever changing scenery and gives rise to a great variety of climate, rainfall, vegetation and occupations of the people.

Topographically, the State may be divided roughly into seven sections: *First:* The peninsula lying between Puget Sound and the Pacific Ocean. The greater part of this peninsula is occupied by the Olympic Mountains, which form a segment of the general coast range. The highest of these mountains reach elevations of from 7,000 to 8,000 feet. The whole section, with the exception of a strip a few miles in width along the coast, presents a very rugged surface, broken into high peaks, steep slopes, deep cañons and sharp serrated divides, which are almost inaccessible in many places, and as a consequence, these mountains form the least known section of the United States. The high-

THE UNIVERSITY OF CHICAGO PRESS

WASHINGTON

est peaks of the Olympics are Mount Olympus, 8,131 feet; Fitzhenry, 8,098 feet, and Constance, 7,777 feet. *Second:* The Puget Sound basin, a wide valley lying between the Olympic Mountains on the west and the Cascade Mountains on the east, extending in a north and south direction from the British Columbia line nearly to the southern part of the State. This basin consists largely of rolling land with many quite extensive level tracts. The soil consists principally of glacial deposits covered in the lower portions by alluvium. *Third:* The Cascade Mountains, which form the most prominent feature of the topography of the State. The general height of these mountains is about 8,000 feet above the sea-level with a number of peaks rising much higher, the highest being Mount Rainier, 14,526 feet; Adams, 12,470 feet; Baker, 11,100 feet; Saint Helens, 9,750 feet, and Stuart, 9,470 feet. *Fourth:* The Okanogan Highlands, extending eastward from the Cascade Mountains to Idaho and lying north of the Columbia and Spokane rivers. This section is characterized by a beautiful rolling surface, with long, gentle slopes reaching down from the watersheds to the wide stream basins. The divides, although attaining heights of 5,000 feet and more, are generally rounding and not sharp or abrupt. *Fifth:* The Columbia plain, which includes nearly all that part of Washington lying south of the Okanogan Highlands and east of the Cascade Mountains. From the Columbia at a height of 500 or 600 feet above the sea, the plain rises gradually to the westward and eastward, reaching a general elevation of about 2,000 feet in the higher parts, with some hills and ridges rising from 1,000 to 2,000 feet above the surrounding plain. Much of this plain is in the form of an elevated plateau with a rolling surface. Several sharp ridges of a mountainous character run down from the Cascade Mountains in an easterly direction toward the Columbia River. *Sixth:* The Blue Mountain Range on the border line of Washington and Oregon represents a local mountainous section in the Columbia plain. These mountains are located in the extreme southeastern portion of the State, the highest points rising 7,000 feet above the sea and about 5,000 feet above the surrounding plain. *Seventh:* The lower Columbia and Pacific Coast section includes that part of the State lying west of the Cascade Mountains and south of Puget Sound and the Olympic Mountains. This section consists largely of ranges of low mountains or hills, with broad valleys intervening, nearly all of which are covered with a dense growth of forest. In this section there are also a few rich prairies of limited extent.

Rivers, Lakes and Harbors.—The principal river of Washington is the Columbia, which enters the State from British Columbia, at about 117° 30' W. longitude, from which point it pursues a southerly course for about 110 miles, flowing thence westerly for about 100 miles, thence south and southeasterly for 225 miles where it unites with its greatest tributary, the Snake River; from this point it pursues a westerly course, flowing between the States of Washington and Oregon, breaking through the Cascade Mountains and entering the Pacific Ocean in lat. 46° 15'. Its principal tributaries in eastern Washington are the Pend d'Oreille, or Clark's Fork, which is the outlet of Lake Pend d'Oreille in northern Idaho; the Spokane

one of the largest tributaries, the outlet of Lake Coeur d'Alene, also in Idaho; the Okanogan, flowing from the north through Lake Okanogan in British Columbia; the Methow; Lake Chelan and its outlet; the Wenatchee and the Yakima, flowing down from the Cascade Mountains, and the Snake River, its largest tributary, which rises in the western part of Wyoming and flows through the southern part of Idaho. In western Washington its principal tributaries are the Lewis and the Cowlitz rivers. The other rivers of the State of any considerable size are the Nooksack, Skagit, Stillaguamish, Snohomish, Skykomish, Snoqualmie, Cedar, White, Duwamish, Puyallup and Nisqually, which flow into Puget Sound from the Cascade Mountains and the Chehalis which flows into Gray's Harbor. The Columbia is navigable for ocean-going vessels to Vancouver and for steamboats over the greater part of its course. The Snake is navigable for more than 150 miles. The Okanogan, Lewis, Cowlitz, Nooksack, Skagit, Snohomish, Duwamish, Puyallup and Chehalis rivers are also navigable for considerable distances.

There are many fresh water lakes in the State. The largest is Lake Chelan, lying between the eastern ridges of the Cascade Mountains. This lake is 50 miles long, from one to three miles wide and more than 1,500 feet deep in many places. It extends from a point near the Columbia River into the very heart of the mountains, and the tourist can here enjoy the novel experience of sailing for more than 30 miles between high ranges of mountains, rising from the water's edge, whose snow-crowned peaks reach elevations of from 7,000 to 10,000 feet above the sea. This part of the State has some of the grandest scenery in the world. Lake Washington, lying in the western part of King County, bounding Seattle on the east, is a beautiful lake 22 miles long, and from 2 to 4 miles wide. The surface of this lake is about 20 feet higher than the mean high tide in Puget Sound, and a government canal is now under construction, at Seattle, to connect it with the Sound. Lakes Crescent and Cushman are the largest lakes in the Olympic Mountains and lakes Wenatchee, Kalchess, Kicheloa, Moses and Cle Elum, are the largest in eastern Washington.

Willapa Harbor and Gray's Harbor are the only good ports on the Pacific Coast. Neah Bay, Clallam Bay, Port Angeles and Dungeness are excellent ports on the Strait of Juan de Fuca. Puget Sound, as it is now known, includes all the waters of the great inland sea, which extends easterly from the Strait of Juan de Fuca, and southerly from the national boundary line to Olympia, a distance of about 200 miles. The waters of the Sound are from 60 to 1,000 feet in depth. The rise and fall of the tide ranges from 9 to 18 feet. There are no sunken reefs or other dangerous obstructions to navigation. The coast line aggregates about 1,600 miles in length. The principal harbors along the Sound are Bellingham Bay, Everett Harbor, Port Townsend, Seattle Harbor, Commencement Bay or Tacoma Harbor and Port Orchard. Owing to the fact that Puget Sound is protected on all sides by high mountain ranges, it may be considered as one great harbor in which vessels can land at almost any point along the whole coast line.

Climate and Rainfall.—Owing to the topography there is a great diversity of climate in

WASHINGTON

Washington. The Cascade and Olympic Mountains and the great plateau or elevated plain of the Columbia play the most important parts in causing this diversity. The Cascade range divides the State into two distinct climatic zones, in which there is little similarity of climate. In the eastern section the climate is dry or semi-arid. The seasons are four, spring, summer, autumn and winter. The average annual rainfall varies in different localities, ranging from 6.50 inches at Pasco to 18.25 inches at Spokane and 24.90 inches at Dayton. The mean January temperature ranges from 22° to 30° in different localities, according to the elevation, and the mean August temperature ranges from 65° to 74°. The highest temperature on record at Yakima, which is a fair average, is 108°, and the lowest is 22° below zero. The climate of the whole of the eastern section is remarkable for its brightness and clearness. The winters are short, and although the days are often hot in summer, the nights are cool and delightful.

In western Washington the climate is equable, with no extremes of heat and cold. Only two seasons are spoken of,—summer and winter. The summers are cool or moderately warm, and the winters are mild and rainy with almost no snow, except on the mountains. In summer the temperature rarely reaches 90°, and in winter it never goes as low as zero. At Seattle, which is a fair average for western Washington, the annual mean temperature is 51.4°, ranging from 40.6° in January to 64.7° in August. The average high temperature is 74° in July and 70° in August, and the average low temperature is 43° in December and 38° in January. The rainfall in western Washington varies greatly in different localities owing to the mountain ranges and prevailing winds. The heaviest precipitation occurs on the coast of the Pacific Ocean and gradually decreases as it proceeds inland around the south side of the Olympic Mountains and down the Puget Sound basin. The annual rainfall averages 89.27 inches on the coast at South Bend; 52.65 inches at Olympia; 43.88 inches at Tacoma; 37.34 inches at Seattle, and 22.42 inches at Port Townsend. While winter is called the rainy season and summer the dry season, it should be understood that every month in summer has some rainy days and that there is considerable clear weather during the winter months. For a period of ten years, during the months of December, January and February, the average number of days per month with precipitation to the amount of .01 of an inch has been from 15 to 19, and the average precipitation per month about five inches; the average number of rainy days in July and August for the same period has been five, the average precipitation has been about one inch each month, and the average number of rainy days has been 162 per year. Thunder and lightning are of rare occurrence and violent wind storms are entirely unknown.

Geology.—Metamorphic rocks occupy a large portion of the State, being of very frequent occurrence throughout the region of the Cascade Mountains and the Okanogan Highlands. The most important varieties of these rocks are gneiss, schist, marble, slate and quartzite. Granite is found in many localities in very large quantities. Crystalline limestone also occurs in a number of places, particularly in the Puget Sound basin. The most important volcanic rock

in the State is the basaltic rock of the Columbia plain, which not only extends over a large portion of Washington, but also covers all of southern Idaho, eastern Oregon and north-eastern California. Sedimentary rocks cover a large portion of the State. The rocks of the Tertiary period are the best known, and are of great economic importance on account of the large deposits of coal and building stone which they contain. The Eocene rocks are nearly all coal-bearing. Pleistocene sediments, in the nature of glacial deposits, occur in the western and northern parts of the State. In all of the mountainous districts, except the Blue Mountains, glacial deposits are found, and the valleys are largely occupied by deep terraces and moraines. The glacial deposits of the Puget Sound basin consist of till, with stratified sand, clay and gravel, in all averaging not less than 500 feet in thickness.

Soil, Agriculture and Irrigation.—There are about 40,000 square miles of forested land in the State, the trees being mostly conifers, with some oak, maple, cottonwood and other deciduous varieties. Nearly all of the western section of the State was originally covered with forests, while in the eastern section the forest areas are confined principally to the slopes of the mountains and the highlands. The soil in western Washington consists largely of glacial drift, being a mixture of sand, gravel and clay upon the uplands, which is very productive when properly handled. In the lower lands there are large areas of sandy loam and semi-peat lands, rich in organic matter, which are very fertile, and grow all kinds of crops that thrive in a porous soil.

In eastern Washington the soil has been formed by the disintegration of basaltic or lava rocks. It is of a dark color, of fine texture, and contains no gravel and very little sand. It is what might be termed a clay loam. It has been stated by eminent authorities that this is the best wheat land in the world, a statement which is proved by the enormous crops produced each year. The higher lands of the Columbia plain are devoted principally to the cultivation of wheat, which is the most important agricultural product of the State. The annual crop of wheat averages about 30,000,000 bushels, and the average yield per acre is about 26 bushels.

In the lower lands of the eastern section the rainfall is insufficient to bring crops to maturity, and irrigation is carried on to a considerable extent with great success. There are now about 150,000 acres of irrigated lands under cultivation, and nearly 100,000 acres more under ditch and ready for cultivation. Numerous irrigation projects are in progress which will result in the reclamation of at least 1,000,000 acres within the next few years. The irrigated lands produce wonderful crops of fruits, vegetables, hay, hops and grain. The climate is very favorable and a great variety of apples, peaches, plums and kindred fruits are raised in great abundance, together with grapes, strawberries, blackberries, raspberries and other small fruits of every kind. The fruits raised in eastern Washington are beautifully colored and of most excellent flavor. The soil of the irrigated section is admirably adapted to the cultivation of all kinds of vegetables, and especially to the cultivation of potatoes, of which large quantities are produced each year. Alfalfa is one of the chief forage

WASHINGTON

plants, producing three or four crops during the season and yielding from 5 to 8 tons of hay per acre. Timothy, clover and other grasses are also raised quite extensively. Hop raising is an important industry, the average crop being 3,500,000 pounds per year. All kinds of cereals are also cultivated to some extent. The Okanogan Highlands and the slopes of the Cascade Mountains furnish extensive ranges for cattle and sheep, which are raised in large numbers. With the settling up of the country, however, the ranges are becoming more restricted year by year, and, as a consequence, domestic methods of stock raising are being adopted with a resulting yearly increase in production.

In western Washington diversified farming, dairying and fruit raising are the principal agricultural pursuits. This section of the State is admirably adapted to the dairying industry owing to the rich soil and the moist, warm climate, which combine to produce an abundance of nutritious grasses, hay, and other stock food, and excellent water. The home market is one of the best in the world, on account of the large population, engaged in manufacturing, lumbering, fishing and mining, and the trade with Alaska. There are 345 creameries and condensed milk factories in the State. All kinds of stock do well in this section and large numbers of horses and hogs are raised. The breeding of Angora goats has also been undertaken with marked success and is becoming an important industry. Hop raising is carried on quite extensively in the river valleys, the average crop being about the same as in eastern Washington; considerable small grain is raised in this section, especially upon the flat lands along the shores of Puget Sound.

Lumbering.—The greatest industry of the State is the manufacture of lumber and shingles. There are in the State 419 lumber mills, with a daily capacity of 26,000,000 feet, and 441 shingle mills, with a daily capacity of 42,000,000 shingles. There are also more than 300 logging camps and a number of planing mills and wooden-ware factories. These mills, factories and camps employ more than 30,000 men; the annual pay roll amounts to \$20,000,000, and the value of the product is about \$35,000,000 annually. The capital employed in lumbering amounts to about \$40,000,000. In 1903 there were 42,701 cars of lumber and 35,764 cars of shingles shipped from the State by rail and 770,057,846 feet of lumber shipped by water. The rail shipments of lumber amounted to 640,515,000 feet, making the total shipments for the year 1,410,572,846 feet, and the number of shingles 5,722,240,000. In addition to the lumber shipped out of the State a large quantity is used in making local improvements. The quantity of timber used by the mills in 1903, aggregated nearly 2,000,000,000 feet board measure. In 1902, the United States Department of the Interior caused an estimate of the quantity of merchantable timber in the State to be made, which shows the total to be 195,237,000,000 feet, board measure. The most valuable tree of the State is yellow fir (*Pseudotsuga Douglasii*), which comprises nearly one half of the merchantable timber. The next most valuable is the red cedar (*Thuja gigantea*), used extensively in the manufacture of shingles. Western hemlock (*Tsuga mertensiana*), yellow pine (*Pinus ponderosa*), sugar pine (*Pinus*

lambertiana), spruce (*Picea sitchensis*) and western larch (*Larix occidentalis*), are also valuable commercial varieties. At the present rate of consumption, the amount of standing timber will supply the mills of the State for at least 100 years.

Mining.—Coal is first in importance in the mining resources of the State. The greatest deposits are found in the Puget Sound basin, and on the eastern slopes of the Cascade Mountains in Kittitas County. The coal fields are very extensive and practically inexhaustible. The veins vary from 5 to 25 feet in thickness. The quality ranges from a rich bituminous coking coal to brown lignites. Deposits of anthracite have also been discovered in the vicinity of Mount Rainier. There are 23 mines in operation, employing about 5,000 workmen. The aggregate output during the year 1909 was 3,602,263 tons of coal and 42,981 tons of coke. The mines of Washington and British Columbia practically supply the Pacific Coast States and Alaska with coal.

There are large deposits of iron ore in the Cascade range and in the Puget Sound basin. Brown hematite ore is found along the Skagit River and is worked to some extent. Magnetic ore is found in King County and bog ore occurs in several localities. Copper and lead are found in the Cascade Mountains and the Okanogan Highlands.

The precious metals are found in several localities, and sufficient development work has been done to prove the existence of mines of great value. In the northeastern part of the State, the mines have been worked on quite an extensive scale. The prevailing country rock, in that district, is limestone and the principal mineral is argentiferous galena. Gold has been discovered in many places throughout the whole extent of the Cascade range and in the Okanogan Highlands.

Fisheries.—Salmon fishing is one of the important industries of the State, and her brands of canned salmon are known in every market in the civilized world. The capital invested in the industry exceeds \$6,000,000; the number of persons employed is about 10,000 and the wages paid amount to more than \$3,000,000 annually. The value of the yearly product of the canneries ranges from \$5,000,000 to \$8,000,000 according to the run of fish, and the value of the fresh, salted and smoked product, will amount to about \$1,500,000 more each year. There are 45 salmon canneries in the State. The propagation of salmon was undertaken by the State in 1895, and since that time 18 hatcheries have been established with a capacity of from 4,000,000 to 8,000,000 fish each per season. This work has been very successful, and has resulted in quite an increase of the supply of salmon. In addition to the salmon industry, the cod, halibut, mackerel and herring fisheries on the banks off the coast of Washington and Alaska give employment to a large number of men. Large quantities of halibut are shipped to the Atlantic coast cities in refrigerator cars, and that line of fishing has developed into an important industry. Oyster culture is also carried on to quite an extent in the shallow waters of Puget Sound and Willapa Harbor. Clams, crabs and shrimp are abundant, and many kinds of game fish are found in the streams and fresh water lakes.

WASHINGTON

Game.—There is a great abundance of large and small game in Washington. Deer are found in all sections, elk abound in large numbers in the Olympic Mountains and to some extent in the Cascades. Mountain goats are numerous on the higher ranges of the Cascades. There are a few mountain sheep on the lofty mountains. Black bears, panthers and wildcats are common. Waterfowl, pheasants, quail, prairie chickens and several kinds of grouse are plentiful.

Manufacturing.—When the census of 1909 was taken, there were 3,674 manufacturing establishments reported in this State. The amount of capital invested was \$222,261,000; the number of persons employed, including clerks and members of firms, was 76,854; the amount of wages and salaries paid was \$59,593,000, and the value of the products was \$220,746,000. The largest manufacturing industries consist of lumber mills, flour and grist mills, shipyards, iron works, paper mills, smelters, breweries, fruit and vegetable canneries, furniture factories, pottery and terra cotta works, creameries and condensed milk factories. Since 1900, manufacturing has increased very rapidly. Many new industries have been established and old ones have been greatly extended in order to keep pace with the growing markets. A careful estimate indicates that there has been an increase of at least 50 per cent since the census was taken. There are about 60 flour mills in the State, producing more than 2,000,000 barrels of flour per annum, which is marketed very largely in the countries of the Orient. Shipbuilding is carried on at a number of localities on Puget Sound and at Gray's Harbor. The Puget Sound Navy Yard and Moran Bros. Company's Works at Seattle, are equipped for the construction of all kinds of ships and boats. The battleship Nebraska was under construction in 1904 at the last named yard. Among the ship-building States, Washington stands fourth as to the number of vessels constructed, and tenth as to the volume of tonnage. A large proportion of the ship-building of the State is the construction of wooden sailing vessels and steamers of various types. The superiority of Washington fir for use in ship construction is recognized in all parts of the world, on account of its great strength and the length of clear timber obtainable. The manufacture of iron and steel has just been begun. One small blast furnace has been established on Puget Sound which produces a high grade of pig iron. With an abundance of raw materials, easily assembled at low prices, and with a large market for the product, the manufacture of iron and steel promises to become one of the leading industries of the State.

Nearly all of the rivers of the State are mountain streams, with a large flow of water at all seasons of the year, and many rapids and falls, which, under modern methods of transmission are capable of supplying power, for all industrial purposes, at a very low cost and in almost unlimited quantities. Large power plants have already been installed on the Snoqualmie and Puyallup rivers. The city of Seattle is constructing a plant upon the Cedar River, to supply the municipality with light and power for both public and private purposes. Several other plants are in the course of construction in the vicinity of the larger cities.

Transportation.—Washington is well pro-

vided with transportation facilities, both by water and by railroad. The rivers, lakes, Puget Sound with its numerous arms, bays and inlets; the Strait of Juan de Fuca and the Pacific Ocean, make all parts of the western section, and many parts of the eastern section of the State easily accessible by boats. There are about 2,700 miles of railroad in the State, not including the electric roads. The chief systems are the Northern Pacific, Great Northern, Oregon Railway and Navigation Company, Pacific Coast Company, Spokane Falls & Northern and the Bellingham Bay & British Columbia Railroad. The Burlington system and the Canadian Pacific also reach Puget Sound under a traffic arrangement with the other roads. Electric railways are now in operation from Seattle to Tacoma and to Renton. Another line is under construction from Seattle to Everett, and a number of other lines are projected.

A large fleet of steamers is operated upon the waters of Puget Sound carrying freight and passengers in the local traffic. Several steamship lines are operated between Seattle, Puget Sound and Alaska, British Columbia, California and the Orient, and between Gray's Harbor and San Francisco. In addition to the regular lines of steamships a large commerce is carried on by means of sailing vessels and itinerant steamships.

Commerce.—During the fiscal year ending 30 June 1910 vessels aggregating 1,806,467 tons entered, and vessels aggregating 2,063,152 tons, cleared in the foreign trade of the Puget Sound Customs District, which includes all of the ports of the State of Washington with the exception of the Columbia River. The value of the imports was \$53,074,271, and the value of the exports was \$32,911,480 in the Puget Sound, Seattle, and Tacoma Customs Districts. In 1893 the imports amounted to only \$830,709 and the exports to \$5,073,436. A very large commerce is carried on between Washington and the other Pacific Coast States, Alaska, Hawaii and the Philippine Islands, and the receipts in this trade average \$30,000,000 and the shipments \$40,000,000 per annum.

Education.—There are 2,407 school districts in the State, in 285 of which, schools of more than one department are maintained. In 1908, the total number of children of school age was 161,640 and the attendance at the schools was 198,214. The reports of the State superintendent of public instruction show that 6,524 teachers were employed. The amount expended for teachers' salaries, buildings and running expenses for 1908 was \$6,469,315. The value of all school property, exclusive of school lands, was \$7,700,000. The average length of the school sessions in the country districts is six months. In the towns and cities the sessions are usually ten months. Nearly every town of from 1,500 upward has a high school with a three or four year course. In a number of places several country districts have combined to form a union high school district. The number of students in attendance at high schools in 1909 exceeded 19,000. For higher education the State maintains the University of Washington, at Seattle, with 113 instructors and enrollment of 2,156 students; the Agricultural College and School of Science at Pullman, 49 instructors, 568 students; and Normal schools at Cheney, 12 instructors

WASHINGTON

198 students; Ellensburg, 11 instructors, and 145 students; and Bellingham, 20 instructors and 355 students. There are 34 private academies and colleges which reported to the State Superintendent in 1903, and a number of others which failed to report. The leading private colleges are Whitman College at Walla Walla; Whitworth College, Tacoma; Gonzaga College, Spokane; Puget Sound University, Tacoma; Vashon College, Burton, and Colfax College, Colfax.

Charitable, Reformatory and Penal Institutions.—The State maintains an institution for the care and education of the blind, deaf and feeble-minded; a reform school for juvenile offenders, a penitentiary; two hospitals for the insane and a soldiers' home. The school for defective youth is located at Vancouver and is properly divided into three branches, namely: for the deaf, the blind, and the feeble-minded. The reform school is located at Chehalis. This institution has a farm and shops of various kinds where boys and girls are taught useful trades. The penitentiary is located at Walla Walla. In this institution there is a jute mill and a brick yard which give employment to a large number of the inmates. The Western Washington hospital for the insane is located near Steilacoom, and the Eastern Washington hospital is located at Medical Lake. The soldiers' home is located at Orting. All of these State institutions are under the general supervision and management of a board consisting of three members appointed by the governor, known as the State Board of Control.

Banks and Finance.—There were in 1909 79 National, 152 State, 11 private banks, 8 savings banks, and 14 loan and trust companies; total, 257 banks. The assessed valuation of real and personal property in the State in 1909 was \$695,152,136, and the State tax levy \$3.50 per \$1,000.

Government.—The State officers are as follows: governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, superintendent of public instruction, and commissioner of public lands, who are elected for terms of four years. The legislature of the State has biennial sessions and consists of a Senate and House of Representatives. There are 42 members of the Senate, one half of whom are elected every two years to hold office for terms of four years. The House of Representatives consists of 94 members, elected biennially for terms of two years. The judicial department is divided into a supreme court and superior courts. There are five judges of the supreme court, whose terms are six years, and 25 judges of the superior courts, elected for terms of four years. The whole State is under county organization, the affairs of each county being administered by a board of county commissioners consisting of three members. The State is represented in Congress by two senators and three representatives.

Population and Divisions.—As shown by the United States census reports, the population of Washington was 11,594 in 1860; 23,955 in 1870; 75,116 in 1880; 349,390 in 1890, and 518,103 in 1900. The U. S. census for 1910 reported the population as 1,141,900.

There are 36 counties in the State which, with their county-seats, are named as follows:

Adams, Riverville.
Asotin, Asotin.
Benton, Prosser.
Chehalis, Montesano.
Chelan, Wenatchee.
Clallam, Port Angeles.
Clarke, Vancouver.
Columbia, Dayton.
Cowlitz, Kalama.
Douglas, Waterville.
Ferry, Republic.
Franklin, Pasco.
Garfield, Pomeroy.
Grant, Ephrata.
Island, Coupeville.
Jefferson, Port Townsend.
King, Seattle.
Knap, Port Orchard.
Kittitas, Ellensburg.

Klickitat, Goldendale.
Lewis, Chehalis.
Lincoln, Davenport.
Mason, Shelton.
Okanogan, Concomully.
Pacific, South Bend.
Pierce, Tacoma.
San Juan, Friday Harbor.
Skagit, Mt. Vernon.
Skamania, Stevenson.
Snohomish, Everett.
Spokane, Spokane.
Stevens, Colville.
Thurston, Olympia.
Wahkiakum, Cathlamet.
Walla Walla, Walla Walla.
Whatcom, Bellingham.
Whitman, Colfax.
Yakima, North Yakima.

There are 50 places in the State of over 1,000 population; 28 of over 2,000; 9 of over 5,000, and 5 of over 20,000. The metropolis is Seattle, on Puget Sound, with 237,194 inhabitants. Tacoma, 83,743; Spokane, 104,402; Bellingham (being Whatcom and Fairhaven, consolidated 1903), 24,208, and Everett, 24,814, are the other cities with more than 20,000 people. All of the cities named are important commercial and manufacturing centres.

Indians.—According to the Annual Report of the Commissioner of Indian Affairs there are 10,019 Indians living upon the 12 reservations in the State. The reservations contain 2,333,574 acres of land. The largest reservations are the Makaw and Quinault reservations on the Pacific Coast, the Tulalip and Puyallup reservations on Puget Sound and the Yakima, Colville and Spokane reservations in eastern Washington. There is also quite a large number of Indians who do not live upon the reservations. Many of them are engaged in agriculture, and a considerable number work in the logging camps and fisheries.

History.—The first record in history of the region which is now the State of Washington, was the discovery, in 1592, of the Strait of Juan de Fuca by a Greek pilot of that name in the service of the Viceroy of Mexico. In 1775, a Spanish navigator, Captain Bruno Hequeta, sailed along the coast and discovered the mouth of the Columbia, and was unable to enter the river. In 1792, Captain Robert Gray, a New England navigator, sailed up the North Pacific coast on a voyage of exploration and on 11 May, he discovered the mouth of the Columbia, sailed into the river, explored it for about 15 miles and gave it the name of his ship. It was this discovery and the exploration that gave the United States their strongest claim to the territory drained by the Columbia, which was known as the "Oregon Country." In the same year Captain George Vancouver of the British navy, explored the waters of Puget Sound. During the next few years, a number of other navigators visited the coast and it soon became quite well known. The first overland exploration was the expedition of Lewis and Clark of the United States army in 1805-6. This expedition, sent out by President Jefferson, traversed the Mississippi Valley, crossed the Rocky Mountains, and followed the Columbia River to its mouth, where they spent one winter. The next military expedition was that of 1843 under Captain John C. Frémont, which reached Vancouver on the Columbia. The first United States Naval Expedition was the exploration of Puget Sound by Captain Charles Wilkes in 1841. The first white

WASHINGTON

people to settle in Washington were the traders of the Northwest Fur Company, who established posts in eastern Washington in 1811. The next white settlement was established by Dr. Marcus Whitman in 1836, near the site of the present city of Walla Walla. The first settlement in western Washington was at Tumwater on Puget Sound, in 1845. The ownership of the country north of the Columbia River was claimed by both Great Britain and the United States until 1846, when, under the Buchanan-Pakingham treaty, Great Britain took all the territory north of the 49th parallel, and the United States all of the territory south of that parallel, except the south end of Vancouver Island. The American territory was organized as the Territory of Oregon, 14 Aug. 1848. On 2 March 1853, that portion lying north of the Columbia River and the 46th parallel was organized as the Territory of Washington. With the discovery of gold in eastern Washington, a great increase of population followed, and the Indians becoming alarmed for their hunting grounds, resolved to exterminate the whites. This led to the Indian war of 1855-6, and there were still further troubles with the Indians in 1857, at the time of the rush to the gold fields of British Columbia, but the greatest rush was after the discovery of gold at Salmon River in 1860. At the time of the treaty between Great Britain and the United States in 1846, the 49th parallel had been accepted as the boundary to the channel between Vancouver Island and the mainland, and thence down that channel to the sea. In 1859 a dispute arose as to which channel was meant, and this was not settled until 1872, when the claims were referred to arbitration and decided by the German emperor in favor of the United States. On 22 Feb. 1880, Congress passed an enabling act providing for the admission of the State of Washington into the Union. The State Constitution was adopted and ratified by the people, at an election held 1 Oct. 1889, and on 11 Nov. 1889, in accordance with the provisions of the enabling act, the President of the United States proclaimed the admission of the State of Washington into the Union. There were 14 governors of the Territory, of whom Isaac I. Stevens was the first. In addition to his duties as governor, he had charge of the survey for a railroad route from the Mississippi River to the Pacific, and was also Superintendent of Indian Affairs for Washington. The first territorial legislature met at Olympia 27 Feb. 1854. Since her admission to the Union the State has had four governors, namely: Elisha P. Ferry, Rep. (1889-92); John J. McGraw, Rep. (1893-6); John R. Rogers, Dem. (1897-1901); Henry McBride, Rep. (1902-4). Governor Rogers died in office and was succeeded by Governor McBride, who was elected as lieutenant-governor.

The growth of the population of Washington was very slow until the advent of the first railroad in 1884, on account of its remoteness and the difficulty of reaching it from the Eastern States. Since that time the development of the country has been phenomenally rapid. The establishment of regular steamship lines between Puget Sound and the countries of the Orient, the trade which has grown up as a result of the great discoveries of gold in Alaska and the Yukon territory in 1897, and the development of commerce between this State and the new

island possessions in the Pacific Ocean, are some of the leading factors which have caused the wonderful progress of the past few years.

JAMES B. MEIKLE,

Secretary Seattle Chamber of Commerce.

Washington, Ark., town, county-seat of Hempstead County; on the Arkansas & Louisiana Railroad; about 110 miles southwest of Little Rock. It is in an agricultural region, and its industries are connected chiefly with farm products. It has considerable trade, especially in the shipments of grain, vegetables, cotton, and tobacco. Pop. about 1,000.

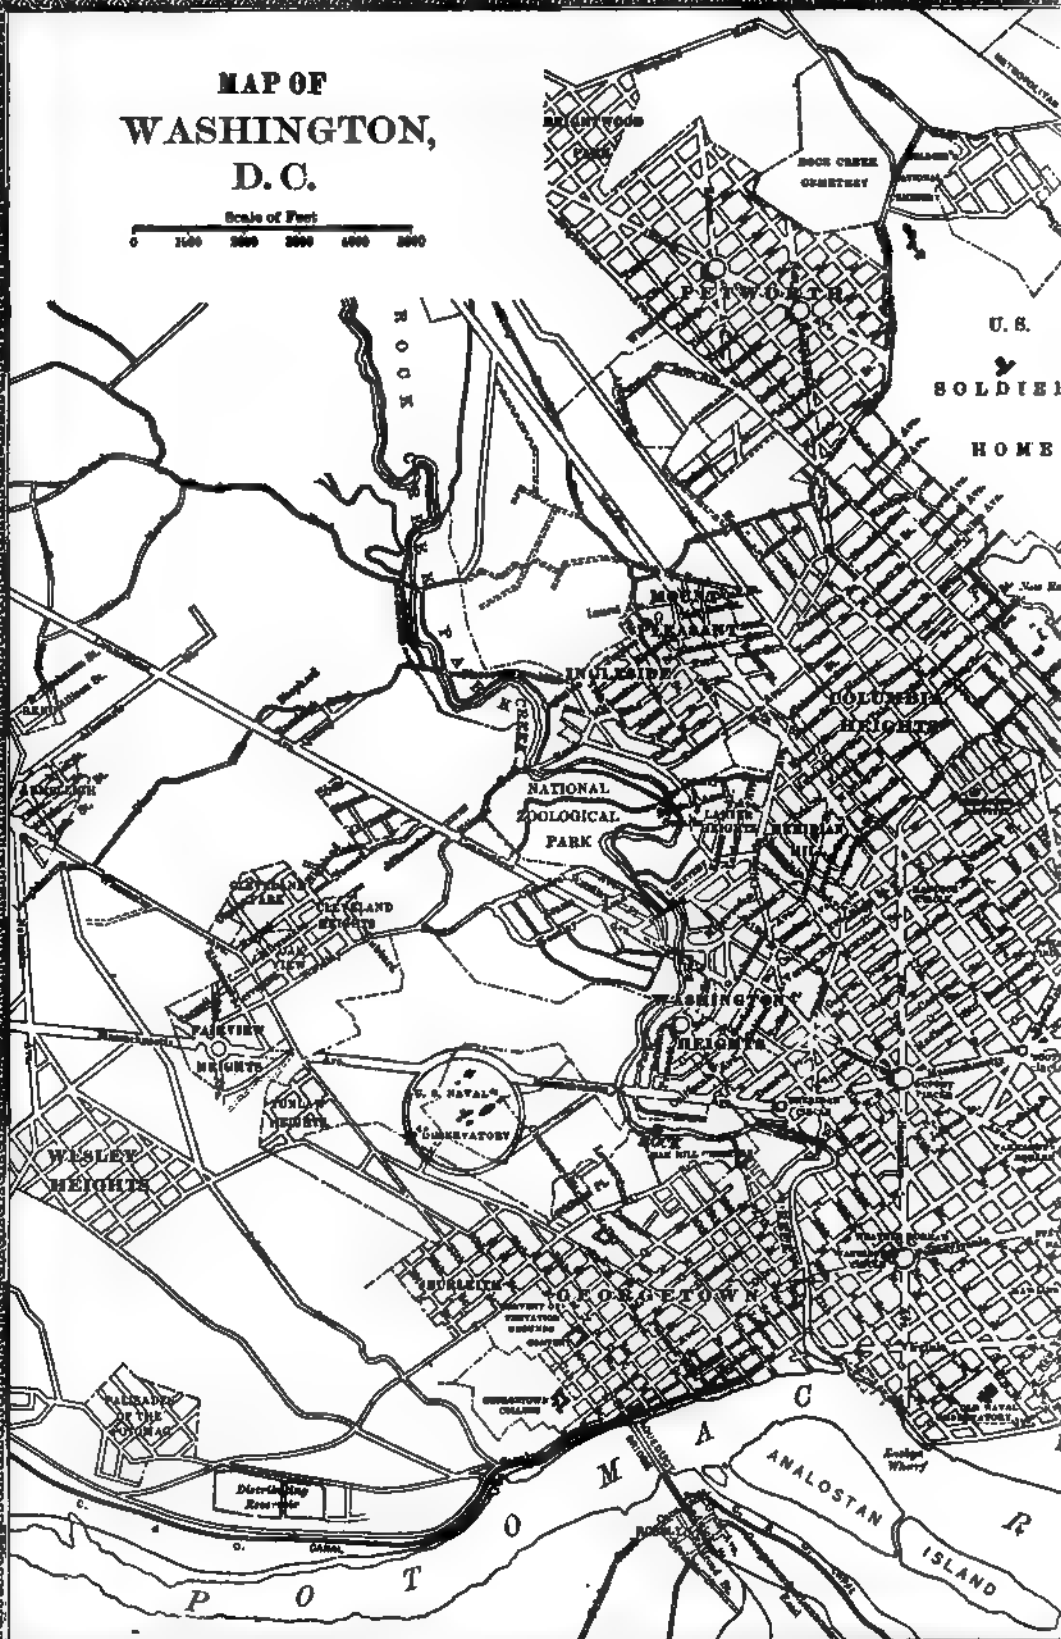

Washington, Conn., town in Litchfield County; on the Shepaug River; about 90 miles northeast of New York and 38 miles north of Bridgeport. It contains the villages of Marbledale, New Preston, Woodville, Washington, Washington Depot, and Romford. Its industries are connected with farm products and caring for guests in summer, as it is a favorite summer resort. Pop. (1890) 1,633; (1900) 1,820; (1910) 1,747.

Washington, D. C. The District of Columbia was established under the authority and direction of the acts of Congress approved 16 July 1790 and 3 March 1791, which were passed to give effect to a clause of the Constitution of the United States giving Congress the power: "To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress become the seat of the government of the United States." The territory obtained for this purpose lies in lat. 38° 53' to 38° N., lon. 76° 58' to 77° W. from Greenwich. Originally 10 miles square, with the southern and part of its western extremity in the State of Virginia, it, through recession of the territory received from that State, became reduced in area to 69¼ square miles made up of what was once a part of Maryland. The site of the District of Columbia is at the confluence of the Potomac and the Anacostia or Eastern Branch rivers, 100 miles from Chesapeake Bay and 185 miles from the Atlantic Ocean. It rises from tide water lowlands at the rivers' banks through a series of hills to an extreme elevation, in some sections, of 400 feet. The District, as it is constituted, in former times comprised the villages of Washington and Georgetown, both of which are now included in the great federal city of Washington, whose government is unique.

The President of the United States and the two houses of the Congress are to this city what the mayor and council are to other cities. The administration of municipal affairs is vested in three commissioners appointed by the President and acting under the sole authority of Congress. One half of the expenses of the government are paid from the revenues of the District and the other half by the United States. The assessed valuation of all the property in the District in 1910 was \$123,000,530. Ten years before, taxes were paid on \$213,250,418: \$264,156,956, more than one half of the total amount of the assessed valuation, was exempt from taxation because it is owned and controlled by the government of the United States. The appropriations for the expenses of the District for the fiscal year ending 30 June 1904 amounted to \$3,088,554.67, of which amount \$4,619,964.44 was paid from the

WASHINGTON

revenues of the District. The estimated population in 1902 was 289,596, including 200,477 whites and 89,119 negroes. The death rate for the same year was 19.986; 15.922 among the white people and 29.129 among the negroes. The birth rate for 1902 was 17.031; 15.393 among the whites and 20.714 among the negroes. The estimated population in 1903 was 295,193; white 204,840, negroes 90,353; pop. (1910) 331,069. The climate is excellent. The mean average annual temperature for 33 years being 55 degrees; average summer temperature for the same period, 75; average winter, 35. The city is reached by six railroad lines, the Pennsylvania, and Baltimore & Ohio, from the north and west, the Chesapeake & Ohio from the west, the Southern, Seaboard Air Line and Atlantic Coast Line from the south, and by steamboat from Baltimore on the north and Norfolk on the south.

History—By act of Congress in July 1790 a commission of three, with President George Washington at its head, was given authority to select on the Potomac River at some place between the mouth of the Eastern Branch and the Conococheague, a site, not to exceed 10 miles square, for a permanent capital of the United States. Within three days after the passage of the enabling act Washington announced the selection of the present site of the city which bears his name. The original acts of Congress relating to the District referred to it as the Seat of Government. Washington called it the Federal City, and the commission which had charge of it after the death of the first President knew it as the City of Washington in the Territory of Columbia. Congress finally accepted the name of Washington for the city and called the territory surrounding and including it, which was gained by cession from the States in which it lay, the District of Columbia. Major l'Enfant, a French engineer serving in the Continental army, who was employed to superintend the laying out of the city, followed plans outlined by Washington, derived, it is believed, from the outlines of Versailles, France. Washington and l'Enfant frequently rode over the site of the city together and the plans they decided upon were afterward developed and carried out, as far as they could be, by Andrew Ellicott, a Pennsylvania engineer, who was employed on the work after l'Enfant—thoroughly discouraged because of obstacles placed in his way by unsympathetic commissioners—had resigned his position. The scheme of the city as originally decided upon, made the Capitol building, located on the western edge of a high plateau, the point from which most of the streets and avenues radiated. Straight lines run through the centre of the building, north and south, east and west, divided the city into four sections known respectively as northwest, northeast, southwest and southeast. The streets were run with practically unswerving accuracy parallel to the marks of division, those streets running east and west being lettered and those north and south numbered. The avenues were planned to intersect the streets at various angles. The streets which followed the dividing lines were known as North Capitol, East Capitol and South Capitol; the western line running through a great expanse of parking directly to the Potomac River from the Capitol. This parking reservation, or series of parks, was called the Mall and was designed to be the most beautiful

section of the city, with the public buildings erected along the northern and southern sides. The cornerstone of the Capitol building, the first public edifice to be erected, was laid 18 Sept. 1793. The seat of government was removed from Philadelphia in 1800, and in November of that year the national legislature met in Washington for the first time. At the outset Congress placed city affairs in the hands of three commissioners; but, not pleased with the results of the experiment, in 1802 the city of Washington was made a corporate town with a mayor, a board of aldermen and a common council. The first mayor was appointed by the President, but all the later incumbents of the mayoralty were elected to office by the people. Georgetown and Alexandria, towns which existed prior to the Revolution, and which were included in the Federal District when that was originally laid out, remained corporate towns with independent municipal governments. In 1814 the city was captured by an expeditionary force of British soldiers and all the public buildings, including the Capitol and the White House, were destroyed by fire. During the first 70 years of its existence as the capital of the United States, Washington was apparently nothing more than one of the most forlorn of villages. No serious effort was made toward ordinary municipal betterment. The United States paid no taxes on the property it held and only made the smallest appropriations for maintenance of the capital city. This lack of public spirit lost to the District the Virginia territory which was ceded to that State on the petition of the citizens of Alexandria in 1846. The creation of a territorial form of government in 1871 which brought the whole District under Federal control again marked the beginning of the era of improvement which is even now progressing. The board of public works, established coincident with the creation of the territorial government, originated and pushed the great public improvements despite the obstacles it faced in the shape of the prejudices of the people. The city was cleaned and renovated; those lines of the Washington-l'Enfant plans which had been ignored or obliterated were re-established and the foundations of the Washington of to-day were laid. The city was left in such a state that when the present form of government was adopted the work was continued as an absolute necessity. Dissatisfaction with the territorial government developed, however, and after experimenting four years the present system was finally established by an act of Congress on 11 June 1878.

Government and Relations with the General Government—The District of Columbia now enjoys a unique form of government which is seemingly at variance with all republican principles and yet which reflects, as does nothing else in the United States the idea of a "government for the people, of the people, and by the people." The citizens of the United States rule their capital city. The people of the capital have no part in it. Three commissioners, one from each of the two dominant political parties and one an officer of the engineer corps of the army, are appointed by the President, with the "advice and consent of the Senate," to administer the affairs of the District for terms of three years each. These officials are paid \$5,000 per year for their work. The salary of the engineer

WASHINGTON

officer detailed for the work is made to equal this amount by additions to his regular pay. All subordinate officers of the government are appointed by the commissioners. Two assistants from the corps of engineers of the army are detailed with the engineer commissioner. The other members of the triumvirate have no assistants. There are two sets of laws in force. One, acts of Congress, corresponding to State laws in other communities; two, municipal regulations enacted by the board of commissioners, taking the place of the municipal laws of other cities. The commissioners have no power to appropriate the money used in the government. Every cent is appropriated specifically by Congress. An annual report is made to the Congress through the President, which contains the annual report of all subordinate officers of the government. The Congress determines upon all public improvements, through committees of each house appointed for the purpose. Nothing can be done, not even so little a thing as the purchase of a box of friction matches, without authority from the Congress. The expenses of the District government are paid, one half from the revenues of the District and one half from the treasury of the United States. The revenues of the District are derived from taxes on real and personal property and licenses of various sorts. The levying of the taxes is in the hands of an assessor who has subordinate to him a board of assistant assessors and a board of personal tax assessors, together with such license clerks, etc., as are necessary to carry on this part of the business of the government. A collector of taxes has charge of the collection of all taxes and license fees. The accounts are audited by an auditor who has an assistant and a large force of bookkeepers, accountants, etc. The police power is vested in a police department consisting of one major and superintendent, one captain and assistant superintendent, four captains and aids to the superintendent, 10 lieutenants who have direct control of the policemen, 35 sergeants, and 642 privates. The city is divided into 10 police precincts, each presided over by a lieutenant. The judiciary of the District includes one supreme court, a court of appeals and a police court. The supreme court of the District includes one chief justice, five associate justices, and one United States marshal. It is so divided into criminal, equity, circuit and probate courts that it transacts in this jurisdiction the same business as that which is accomplished by the Federal, State and municipal courts of other localities, the members of the bench alternating in the various branches. The court of appeals has one chief justice and two associate justices. This court hears appeals from the District supreme court and also from the commissioner of patents. The police court consists of two branches, each presided over by a police justice. One branch attends to violations of the municipal regulations and the other to infractions of United States laws. In all the courts, but the last named, the justices are appointed by the President for life terms. In the police court the justices are appointed for terms of four years each. Connected with the supreme court there is a register of wills and a recorder of deeds. The maintenance of true lines of streets, etc., is charged to the surveyor's office, which includes in its force one surveyor and his assistants, all under the control of the

engineer commissioner. The sanitation of the city is under the charge of a health officer who has a deputy and numerous inspectors. A superintendent of street cleaning, assisted in the work by about 400 men, has charge of the cleaning of the streets, much of which is done by the hand cleaning system. The city fire department consists of one chief engineer, four assistants, one fire marshal, one machinist, 14 steam engine companies, five chemical engine companies and six truck companies, each of the detachments or companies being under the control of a foreman and one assistant. There is an engineer department under the direct control of the engineer commissioner. The divisions of city government enumerated above, together with the other subordinate departments, are presided over by the two civilian commissioners, each having his special departments for control and observation. It requires, however, a majority vote of the whole board to determine any question of policy in carrying out the acts of Congress relating to the District. The Congress exercises a most jealous care of the District. Its appropriations are made separate and distinct for every department of the municipal structure, the smallest items being provided for specifically. In addition to going through the hands of the auditor for the District they are carefully scrutinized by the auditor for the State and other departments and the comptroller of the treasury. All money is disbursed by an officer appointed for the purpose by the commissioners. This officer has no connection with any of the other departments. A handsome municipal building for housing all branches of the city government is now (1904) about to be constructed at a cost of \$1,500,000. The water supply of the District comes from the Potomac River at a point about 15 miles above the city. It is carried through an aqueduct from the river to large storage reservoirs and from these is pumped into the city. A filtration plant is under construction near Soldiers' Home, which will cover 29 acres of ground and will be sufficient to filter all the water used in the city. The water is of excellent quality, free from impurities, although at times it is very muddy. It is drawn from the mountain streams of the Alleghenies which empty into the Potomac in the Cumberland Valley. The water supply with everything relating to it is under the charge of the United States government, by which it is owned. A nominal water rent is charged consumers.

Education.—The public school system of the District is said to be the finest in the United States. It is under the control of the commissioners through a board of education composed of seven members. The administration of the affairs of the schools is all in the hands of this board, which is made up of prominent citizens who receive a nominal fee or salary. The head of the system is a superintendent, aided by two assistant superintendents who report to him and perform such duties as he assigns. There is a secretary who is the official representative of the board. The board makes requisition upon the commissioners for all expenditures. These must be approved by the commissioners, who also make all contracts for school supplies, the purchase of sites, and erection of buildings. The school system includes eight grades of primary and grammar schools and a high school course

with military instruction for the boys. At the end of his work in the graded schools a pupil may elect either an academic, a scientific, a business or a technical course in the secondary schools. After passing through four years in the academic high school a pupil may prepare himself for appointment as a teacher by a two years' course in the normal school. The total enrolment for the school year 1903-4 was 48,745, of which 32,987 were white pupils and 15,758 were colored. These pupils were enrolled in 1,023 schools divided as follows: normal, 170; high schools, 2,673; manual training schools, 816; grammar and primary schools, 43,310; kindergarten, 1,776. During the fiscal year ending 30 June 1904 the appropriation for the public schools was \$1,222,283.90. The enrolment for that year was 48,432, making the cost per pupil \$25.23. During the same year the number of teachers employed in the schools was 1,391 and the number of schools 983. Washington is also the seat of many universities, colleges, seminaries, academies and private primary schools. The Catholic University of America is situated in one of the northern suburbs of the District near the head of Lincoln Avenue. This institution was first organized in 1865 under the direction of the Catholic hierarchy of America, but was not actually established until the fall of 1889. It is one of the foremost institutions in the country for the study of the advanced branches of science and philosophy. The oldest institution of learning in the District is the Georgetown University, founded by Archbishop Carroll of Baltimore in 1789 and conducted under the direction of the Jesuit Order of the Roman Catholic Church. This University occupies a magnificent park on the heights above Georgetown and has all the departments of a modern university, with its law and medical schools located in the down town section of Washington. Connected with the medical school is a well equipped, modern hospital, located in Georgetown near the university proper. The oldest college or seminary for women is the Georgetown Convent, established also by Bishop Carroll, in 1798. It receives young women of the Roman Catholic faith and educates them in all the higher branches of learning. It also receives novices for the orders of sisterhood. Howard University, established by an act of Congress in 1867 and supported almost entirely by the government, furnishes opportunities for an education to the negro. This institution has medical, dental and law departments as well as the regular academic course. It also fits young men for the ministry and has a preparatory department. The Presbyterian Church has had much to do with its development, although the government makes annual appropriations for its maintenance and for the maintenance of the Freedman's Hospital, in connection with which the university medical department is operated. The Columbian University was chartered in 1821 and up to 1904 was under the direction of the Baptist Church. The sectarian clause in its charter was removed by act of Congress during the early months of 1904 and at the same time the university was given permission to change its name. The new title is the "George Washington University." It has about 200 officers of government and instruction and includes all the departments of a well-equipped university: legal, medical, dental, scientific, and collegiate. In ad-

dition to these the institution established a few years ago a school of diplomacy and jurisprudence in connection with its law school, and a modern well-equipped hospital in conjunction with its medical department. Trinity College, a Roman Catholic institution situated near the Catholic University of America, was formally dedicated in November 1900. It was designed for the higher education of women and is conducted by the Sisters of Notre Dame de Namur. The new Academy of the Visitation, on Connecticut Avenue between L and M streets, was established in 1850 as an offshoot of the Georgetown Convent. It is designed for the education of girls and is one of the best schools in the District. The Academy of the Holy Cross, another Roman Catholic institution of learning, primarily planned for the education of little girls, was founded in 1868 and is under the charge of the Sisters of the Holy Cross. The Christian Brothers conduct the Saint John's College, an institution that instructs young boys in the lower branches of learning and prepares them for college. Gonzaga College, carried on in connection with the Society of Jesus, is one of the finest preparatory schools in the country. It has a battalion of cadets and a band, all composed of students. The National University was established about 1870, the intention being to create a national institution on the lines recommended by George Washington. This university has no collegiate course, but has schools of law, medicine, dentistry, and pharmacy. Recently the medical and dental branches became a part of the Columbian University. The Columbia Institution for the Deaf and Dumb, known also as Gallaudet College, was incorporated by Congress 15 Feb. 1857. Amos Kendall, a prominent citizen of the District and a well-known philanthropist, had much to do with its organization. It is situated in a beautiful locality in the extreme northeastern section of the city of Washington. The first superintendent was Edward Miner Gallaudet, whose son is now its president. The school for the deaf in connection with the institution is known as the Kendall School. The collegiate department is named Gallaudet College in honor of the Rev. Thomas Hopkins Gallaudet. Congress makes an annual appropriation for the maintenance of the institution. The American University, yet in the course of organization, under the direction of the Methodist Church, promises to be one of the finest institutions of its kind in the country. This organization owns a large tract of land in the suburbs near Tenleytown, where it already has one building in the course of construction. Washington is peculiarly situated regarding scientific institutions. The numerous government bureaus bring to the city a vast concourse of eminent men of science. The most important of these institutions are the naval observatory, the Smithsonian Institution (q.v.), the geological survey, the coast and geodetic survey, the public health and marine hospital service, the national bureau of standards, the various bureaus of the department of agriculture, and the museums and laboratories of the army and navy medical departments. All of these bureaus or offices pursue the study and development of special branches of science and their libraries are among the most valuable, on the subjects considered, in the world. Connected with the Smithsonian Institution is the

WASHINGTON

National Museum in which is gathered a collection of subjects relating to the various branches of the sciences and to the history of the United States. Each is presided over by an eminent master of science and each offers an almost limitless opportunity for research. For the benefit of those who desire to engage in study along any of these lines, but who have not the means to accomplish their desires, an institution has been established, known as the Carnegie Institute, to which Andrew Carnegie presented \$10,000,000 with which to carry on the work. Washington possesses a public library, through the munificence of Mr. Carnegie, which cost \$300,000. Mr. Carnegie has also given a sufficient sum for the purpose of establishing branch libraries. The Library of Congress (q.v.) forms, perhaps, the largest institution of its kind in the United States. It is open to all the people, and is especially patronized by residents of the District. The Corcoran Art Gallery, a handsome structure containing copies and originals of famous works of art from all sections of the world, is closely related to, yet independent of, the educational institutions of the government. In addition to the Library of Congress each department of the general government has its library and there are also valuable libraries connected with the army and navy medical museums, the former being the best of its kind in the world. The law library of the Bar Association of the District is a very valuable institution, situated in the City-Hall, where the District Supreme Court is housed. Each departmental library contains volumes relating particularly to the work of that department.

The peculiar conditions governing Washington physically have their effect on its moral government. The humane institutions of the Capital City are divided into three classes. First, those supported entirely by the combined general and local government; next, those supported partially by the same government combination; and third, those maintained solely by private means. In the first class are the Washington Asylum, including the work house, an institution for correction, and the alms house with a hospital to which the sick of both these institutions are sent; the Municipal Lodging House; the Soldiers and Sailors' Temporary Home; the Soldiers' Home; the Board of Children's Guardians, the Industrial Home; Freedman's Hospital for Negroes, and the Government Hospital for the Insane. In the second class are the Columbia Hospital for Women, Children's Hospital, National Homeopathic Hospital, Providence Hospital, Garfield Hospital, Central Dispensary and Emergency Hospital, Eastern Dispensary and Casualty Hospital, Woman's Clinic, Washington Home for the Incurables, National Association for the Relief of Destitute Colored Women and Children, Working Boys' Home and Children's Aid Association, Washington Hospital for Foundlings, St. Ann's Infant Asylum, German Orphan Asylum, Woman's Christian Association, Young Woman's Christian Home, Florence Crittenton Hope and Help Mission, Aid Association for the Blind, Woman's Dispensary. The third class includes many institutions and associations which have for their object the caring for sick and incapacitated persons. Under this head come the two university hospitals, Georgetown and Columbian, and several charitable organizations.

The Government Hospital for the Insane, including a tract of several hundred acres of land, is situated on the south bank of the Eastern Branch. The institution was primarily designed for insane soldiers and sailors of the United States, but it receives beside these indigent insane persons of the District of Columbia. This is regarded as one of the foremost institutions of its kind in the country. A superintendent, appointed by the Secretary of the Interior, reports to the Interior Department annually as to the progress and condition of the affairs of the institution. A board of visitors, composed of prominent citizens of the country, has indirect supervision over the hospital and its surroundings. The second largest public institution conducted by the government is the National Soldiers' Home, situated in the suburbs north of the city. This institution furnishes a home for the soldiers of the regular army after retirement either through age or disability. It is governed by a board of army officers. The 500 acres which it occupies are fitted up with a number of handsome buildings, among which is a well-equipped hospital, presided over by a surgeon of the regular army. Washington has numerous private charities and institutions for charitable purposes in connection with the various churches and religious organizations. The charities of the District are superintended by a board of prominent citizens known as the board of charities; appointments to this board are made by the President of the United States.

Streets, Avenues, and Parks—The wide streets and avenues and the numerous parks and parking spaces form the feature which most distinguishes Washington from other cities. Within the limits of the District there are 447.53 miles of paved streets of which amount 128.03 are asphalt and coal tar; 21.87 asphalt block; .52 vitrified brick; 27.34 granite block; 9.18 cobble stone; 71.36 macadam and 189.25 gravel. The gravel pavement is practically all in the parks and in the suburbs so that it cannot be taken as an indication of the treatment of the city streets. The mileage of asphalt streets is greater, it will be seen, than the mileage of all the other pavements, except gravel, put together. The distinctive feature is the slight use made of cobble stone in the pavements. Only 9.18 miles of street are paved in this manner and these are rapidly giving way to asphalt or asphalt block. The system of streets laid out by Washington, l'Enfant and Ellicott has been strictly adhered to. There are 21 avenues named after the various States. The streets and avenues are never less than 60 feet wide and vary from 60 feet to 160. Pennsylvania Avenue, which is the broadest street, is paved with asphalt almost its entire length, from the Eastern Branch to Rock Creek. Much of the property controlled by the United States is in public parks. Wherever an avenue intersects a numbered or lettered street the space between the avenue and street intersected, often an entire block in length, is converted into a public park. Many of these small parks are equipped with fountains and shrubbery and in all of them flowers are grown in huge masses during the proper seasons. These are under the direction of the superintendent of public buildings and grounds, an officer of the engineer corps of the army. The largest park in the city proper is called the Mall, which extends for about a mile and a half

1. House of Representatives

2. Senate Chamber

WASHINGTON

from the Capitol building to the Potomac River and from B Street south to B Street north, giving it a width of four city blocks. It contains 230 acres. In the L'Enfant plan it was intended to improve this park by making a long vista or avenue, extending from the (then proposed) Washington monument to the Capitol, on the order of the Versailles gardens. This has never been done although recommended from time to time by architects and artists. The most recent recommendation was that of a distinguished commission of architects known as the park commission, appointed by the chairman of the Senate Committee on the District of Columbia to study the treatment of the parks in the capitals of Europe and to prepare a report as to what could be done in Washington. This report was presented to Congress in 1902, and provides for the expenditure of \$100,000,000 and the purchase by the government of all the property lying between Pennsylvania Avenue and the Mall on the north and between Maryland Avenue and the Mall on the south. Indications are that the plans, with some modifications, will gradually be adopted. The grounds surrounding the Soldiers' Home and in Rock Creek Park are the most extensive public reservations in the District. The former park is lined and interlined with drives of every sort. In the summer these are made most delightful by the great variety of foliage of the trees and the care taken in the cultivation of flowers and shrubbery. The Rock Creek Park, a vast tract of 1,775.9 acres acquired by the government during the last 20 years, is designed for a great national park. The government's zoological collection finds a home in one corner of this tract, which extends from the city limits to the District line and through which flows Rock Creek. The government owns most of the land for a considerable width along Rock Creek from the District line to the point where it empties into the Potomac near the western extremity of the Mall and the plans of the park commission provide for a system of driveways which will eventually connect Rock Creek Park with the Capitol building. The government has in the course of improvement a large tract of land known as Potomac Park, including a great area which has been reclaimed by dredging from the flats along the western and southern river front. This property is rapidly yielding to improvements which will make it one of the finest parks in the world. The Mall is connected with the parking surrounding the White House, the Treasury and State departments, by a reservation known as the President's Park or White lot, lying directly north of the Washington Monument. At points where two or three streets and avenues intersect, a small circular bit of parking is created, and in the, too, statuary has a place. This is shown by Lafayette Park, opposite the White House; Lincoln Park, at 11th and East Capitol streets; Garfield Park, between Third and Sixth and D and E streets southeast; Scott Circle, Thomas Circle, McPherson Square, etc. The parking about the Capitol building is very extensive and highly improved. Statues of Washington, Chief Justice Marshall and Garfield are found in and about this park. Statues of Scott, Farragut, Thomas, McPherson, Lafayette, Reamebeau, Jackson, Washington, and many other famous soldiers and statesmen are found at various points throughout the city, in

a majority of cases in parking spaces named in honor of the men whose statues adorn them.

Commerce.—Washington's commercial interests are small. Manufacture is carried on in the city in a very limited degree, although a large sum of money is invested in plants and material and the value of the output is considerable. To a great extent the goods turned out are for home consumption only. The census report for 1900 shows that there are 518 manufacturing establishments with a total capital of \$30,553,000. In these establishments are employed 9,758 persons who are paid in wages \$6,835,000 annually. The raw materials used were valued at \$10,246,000 and the product was \$25,289,000. Fully 20 per cent of the manufacturing and mechanical industry of the District is the product of the government. The financial interests are much more important. Reports made to the comptroller of the treasury in April 1903 by the banks and trust companies of the District show that since 1894, although there is one less bank and one more trust company, the capital of the banks of Washington has more than doubled. The amount of money available in the local banks of Washington is given as \$53,041,445. In 1895, with 13 banks and three trust companies the capital was but a little over \$23,000,000. The real estate interests of the city are enormous. Investors from out of town control large blocks of property and there has, in times past, been much speculation. Over 50 per cent of the property is controlled by the United States government and its holdings are being increased from time to time as the demand for sites for public buildings increases. To the active speculation in real estate Washington owes the development of its handsome suburbs, both in the District and in the States immediately surrounding it. Aside from the manufacturing interests a vast business is carried on in its mercantile establishments. Washington has several modern department stores of the most advanced type. The business section of the city, from Sixth to Fifteenth streets, east and west, and from Pennsylvania Avenue to K Street, north and south, teems with life at all hours of the day. Most of the business is carried on in the northwestern quarter of the city, although there are small establishments in great number in every section.

Transportation.—The street railroads have played no unimportant part in the development of the District. All of the street railroads within the heart of the city are operated on the underground electric system. This general adoption of the underground system is the result of legislation by Congress prohibiting the stringing of wires and the use of the overhead trolley within the city limits. There are but two railroad companies doing business in the District properly speaking. The largest of these, The Washington Railway & Electric Company, is a syndicate controlling the operation of eight of the smaller companies. It operates eight lines in the city and six lines in the suburbs. The other company, the Capital Traction Company, controls three lines operating on Pennsylvania Avenue, Seventh Street and Fourteenth Street respectively, with their branches and connections. The total street railway mileage in the District is 146.29 miles; 75.80 miles of which is double track underground electric; 9.93 miles is single track underground electric;

37.60 miles is double track overhead trolley; 2.06 miles is single track overhead trolley; all the overhead trolley lines are operated in the suburbs, and in several instances connect with related lines in Maryland and Virginia.

Public Buildings.—Because of the stringent building laws in the District the skyline of Washington will never be disfigured by tall office buildings. The law requires that no building shall exceed in height the width of the street on which it fronts. The public buildings are many and of fine architecture, as are also hundreds of the private residences. The largest and most important building is the Capitol, situated on a high plateau 88 feet above the level of the river. The central portion of the building was begun in 1793; in September of which year the corner stone was laid by President Washington. This part of the structure is built of sandstone quarried on Aqua Creek, Va., a few miles below Washington, and cost up to 1827, \$2,433,844.13, which included the expenditures made necessary by repairs after its destruction by the British on 24 Aug. 1814. The corner stone of the extensions or wings was laid 4 July 1851 by President Fillmore, Daniel Webster officiating as orator. These extensions were completed in 1859. The building is 751 feet 4 inches in breadth and 350 feet in depth. The area covered by the building is 153,112 square feet with a height from a base line at the east front of 287 feet 5 inches. The total cost of the Capitol building was about \$14,000,000. Next to the Capitol itself the Library of Congress is the most important structure in Washington. This was completed in 1897 and cost the government \$6,347,000. It contains the great national library and 45 miles of shelving, sufficient to hold 2,200,000 octavo volumes. In addition to the 1,415,475 books, papers, pamphlets and prints that are kept within its doors, the library has 178,140 other articles deposited for copyright purposes. The business of the library furnishes employment for 417 people and the last annual appropriation for its maintenance was \$768,845. The treasury department, at the corner of Fifteenth Street and Pennsylvania Avenue, the oldest of the departmental buildings, is constructed of freestone and granite in the Ionic style and cost \$7,000,000. On Pennsylvania Avenue between Eleventh and Twelfth streets is the new city post-office and post-office department. This building, constructed entirely of granite, occupies an entire block. It is one of the handsomest structures of the modern style of architecture. The State, War and Navy departments occupy a large granite structure built on the Renaissance style of architecture at the corner of Pennsylvania Avenue and Seventeenth Street. This building occupies more than four and a half acres and cost \$11,000,000. It is said to be the handsomest structure in Washington, excepting the Capitol and Library buildings. The building popularly known as the Patent Office, but which is really the secretary's office of the Interior Department, is a large structure of white marble of a pure Doric style. It cost \$3,000,000, and occupies the two blocks between Seventh and Ninth and F and G streets northwest. Opposite this building, fronting on F Street, is the old building of the post-office department, a structure built of marble in the Corinthian order of architecture, covering one block. This building is occupied

by the general land office and Indian bureau. The pension bureau is housed in an imposing brick structure in Judiciary Square, near the corner of Fifth and F streets northwest. Here have been held many of the great functions known as inaugural balls. The old city-hall building, now occupied by the District Supreme Court and Court of Appeals, is one of the old city buildings. It is situated in Judiciary Square fronting on D Street and Louisiana and Indiana avenues, at the head of Four and a Half Street or John Marshall Place. The home of the President, fronting on Pennsylvania Avenue, between the Treasury Department and the State, War and Navy building, is an artistically plain building of freestone painted white, from which it derives the name of White House. This was one of the buildings partially destroyed by fire in 1814 at the time the British burned the city. The offices of the President are contained in a low white building, built of brick, at the western extremity of a long colonnade extending from the White House. Directly south of the White House is the Washington Monument, a marble shaft 555 feet in height, to the building of which almost every country on the face of the earth contributed a stone. An elevator is run to the top of the building from which a fine view of Washington can be obtained. The Washington Public Library, the gift of Andrew Carnegie, occupies a parking space known as Mount Vernon Square, at the intersection of Seventh, Eighth, Ninth, and K streets and Massachusetts and New York avenues. This beautiful building was opened in 1902. On the south side of the Mall near Ninth Street is the Smithsonian Institution, a building of brownstone in the ancient Gothic style of architecture. It is one of the handsomest structures in the city and was built with money bequeathed by James Smithsonian, an Englishman. Adjoining it on the east is the National Museum, whose new building, which was built in 1905, cost in the neighborhood of \$4,000,000. Near the Museum are the Army Medical Museum and the Fish Commission buildings. To the west of the Smithsonian Institution is the building of the Department of Agriculture. Congress, in 1903, appropriated money for a new building for this department. Near the Department of Agriculture is the Bureau of Engraving and Printing, where all the paper money, stamps and bonds are made. The government printing office, the largest and most complete printing establishment in the world, is housed in a huge brick structure on the block bounded by North Capitol and First and G and H streets northwest. The large public buildings also include the naval observatory, the naval museum of hygiene and the coast survey buildings. New buildings are about to be constructed for the department of justice, for the Supreme Court of the United States, for the bureau of standards, and for the safe-keeping of government records. There is also in the process of construction a union station building which is to be one of the finest and most commodious of railroad terminals. It will cost about \$5,000,000 when finished and the approaches to it will cost about \$11,000,000. Part of the expense of changing grades, etc., is to be borne by the United States and District governments. There are many large buildings owned by private individuals or corporations which add to the architectural

WASHINGTON, D. C

A CORNER OF THE PERSIAN LEGATION.

WASHINGTON

beauty of the national capital. Among these are the *Evening Star* building, the Southern Railway building, the Lafayette Square Theatre, the New Willard Hotel, the Shoreham Hotel, the Cosmos Club, the Georgetown University, the Catholic University, the McKinley Manual Training School and the buildings of the Soldiers' Home.

Military.—Washington as the headquarters of the army and navy has three public reservations devoted exclusively to these branches of the public service. The most important of these is the navy yard, containing gun shops in which all the large guns for the vessels of the navy are made. Here also is a huge tank in which models of naval vessels are tested for speed, displacement, etc. Connected with the navy yard is a museum of arms and ordnance. Near the navy yard is situated the marine barracks, covering an area of two city blocks. The largest military reservation in or near the District is Fort Myer, originally established on the heights above Washington on the Virginia shore of the Potomac, as a post for the signal corps and named in honor of Gen. Myer, the officer who established the signal corps as a part of the army but who is better known for having established the weather bureau. At Fort Myer barracks and quarters are maintained for four troops of cavalry and two batteries of field artillery of the regular army. The reservation at Fort Myer adjoins the Arlington National Cemetery and includes a portion of the old Custis estate. In Washington is situated the Washington Barracks, now the seat of the Army War College and the School of Application for the engineer corps of the army. This is the oldest military post in this section of the country, having been established prior to the war of 1812 as an ordnance storage post. On this reservation the statue of Frederick the Great, the gift of the Emperor of Germany, was erected in October 1904. Here also is the site of the old military prison where the conspirators who were charged with complicity in the assassination of President Lincoln were tried, sentenced and those given the death penalty were executed. Near Washington are Forts Washington, Hunt and Foote, all of which are on the Potomac River below the city. The organized militia of the District of Columbia numbers about 1,700 men grouped into one brigade of two regiments and one separate battalion, including 28 companies of infantry; one battery of field artillery, one engineer corps, one signal corps, one ambulance corps and one naval battalion. The brigade is commanded by a brigadier-general who with his staff and all the line officers, are appointed by the President. The adjutant-general of the District militia is an officer of the regular army detailed by the War Department.

Churches.—Washington has some of the finest church buildings in the country; 17 sects are represented with 163 places of worship. The Episcopalians head the list with 31 churches; the Methodists have 27; Presbyterian, 22; Catholic, 17; Baptist, 16; Lutheran, 15; Methodist Episcopal South, 6; Methodist Protestant, 6; Congregational, 4; Christian (Campbellite), 4; Friends, 4; Reformed, 2; Hebrew, 2; Swedenborgian, Unitarian, United Brethren and Universalist, 1 each. In addition to these there are three organized societies of Christian Scientists; two Spiritualistic societies, one Pro-

gressive Brethren and two non-sectarian, the People's and the United States Christian. The aggregate membership in all these organizations is considerably over 60,000. The amount of property held by religious orders or organizations which is exempt from taxation and is used for religious purposes has an assessed valuation of \$6,405,702, this, in addition to the property held by such organizations for educational or charitable purposes, which is also exempt from taxation. The best known churches in Washington are the New York Avenue Presbyterian Church (Lincoln's Church), the Metropolitan Methodist Episcopal Church, attended by Presidents McKinley and Grant; the Church of the Covenant (President Harrison's church), the First Presbyterian Church (President Cleveland's church), and Saint John's Episcopal Church, the most fashionable church in Washington. To this list might also be added Grace Dutch Reformed Church, which President Roosevelt attends.

Cemeteries.—There are nine large cemeteries in or near the District. The largest is the Arlington National Cemetery, the old Custis estate on the Virginia side of the Potomac River overlooking the city. This is the magnificent estate owned by Gen. Robert E. Lee which was seized by the general government. The old mansion yet remains preserved in excellent condition. On the broad hillside sloping from the mansion to the river lie buried many of the soldier dead of the country, with Sheridan, Crook, Lawton, and Admiral Porter among the most prominent men whose last resting place this is. Here also can be found the graves of the men who perished in the Maine and many of those who died from wounds and disease in Cuba and the Philippines, together with the graves of thousands of Union and Confederate dead of the Civil War. At Soldiers' Home the inmates of the home are buried and many a veteran finds his last resting place here. Another national cemetery is that at the extreme end of Seventh Street road known as the Battle Ground Cemetery. Washington has but one crematory for the dead. In addition to the cemeteries included in the figures given above there are several devoted exclusively to negroes and one or two for the Hebrew dead.

Society.—The national capital is rapidly becoming the social and educational centre of the United States. Persons of great wealth from all sections of the country are flocking to the city during the sessions of Congress, many such persons having built large residences here. The city, as the focal point of governmental activity, attracts large numbers of people of all classes, making the social season one of great interest and activity. The clubs and theatres are among the best in the country. The most important clubs are the Army and Navy, Cosmos, Metropolitan, University, Alibi, Chevy Chase, and Country. The two last named are country clubs having handsome club houses in the suburbs. In addition to these there are a number of smaller clubs and club houses. There are seven theatres in the city.

Newspapers.—Almost every daily newspaper of consequence in the United States has an office in Washington, some of the largest papers supporting resident staffs with regular organization throughout the year, while others maintain correspondents during the sessions of Congress.

WASHINGTON

There are three large daily newspapers in Washington, the *Evening Star*, an afternoon paper owned by the Evening Star Newspaper Company, of which S. H. Kauffman is president and Crosby S. Noyes editor, the *Washington Post*, owned by the Washington Post Company, of which Beriah Wilkins is the president and editor, and the *Washington Times*, owned by Frank A. Munsey. There are several weekly and monthly publications which enjoy a large circulation. Pop. (1910) 331,069. See also DISTRICT OF COLUMBIA.

GEORGE H. HARRIES,
Vice-Pres. Washington Railway & Electric Co.

Washington (D. C.), Early's Attempt on. On 13 June 1864 Gen. Early marched from Gaines' Mills, under orders from Gen. Lee, to attack and drive Gen. Hunter from the Shenandoah Valley and then cross into Maryland near Leesburg, or at or above Harper's Ferry, and threaten Washington, thus hoping to draw troops from Grant's army. Hunter's failure at Lynchburg (q.v.) and his retreat toward the Kanawha left the Shenandoah Valley open to the movement into Maryland, and 27 June Early concentrated his army at Staunton, moving next day down the valley and reaching Winchester 2 July. He broke the railroad west of Martinsburg, drove Gen. Sigel from that place 3 July and across the Potomac to Maryland Heights (q.v.), crossed the Potomac at Shepherdstown Ford, demonstrated on Sigel, then crossed South Mountain by Turner's, Fox's, and Crampton's Gaps and attacked and defeated Gen. Lew Wallace on the Monocacy (q.v.), 9 July, Wallace retiring on the Baltimore road, leaving open to Early the road to Washington. Early had under his command the four infantry divisions of Rodes, Ramseur, Gordon and Echols, Ransom's division of cavalry, and Long's three battalions of artillery, in all about 15,000 men and 50 guns. On the morning of 10 July Early marched on the direct road to Washington and bivouacked at night four miles north of Rockville. McCausland's cavalry brigade, which had preceded him, drove from and beyond Rockville, about 600 Union cavalry, under command of Maj. Fry, of the 16th Pennsylvania cavalry. During these movements, from the time of entering Maryland, the Confederate cavalry was industriously engaged in gathering up horses, sheep, hogs, and cattle of all kinds, grain, bacon, and subsistence of every kind, and shoes and clothing. The live stock was driven across the Potomac. Bradley T. Johnson's cavalry brigade, moving from Frederick toward Baltimore, occupied several towns on the way and destroyed the Northern Central Railroad at Cockeysville. Another cavalry detachment stopped a train of cars at Magnolia Station, on the Baltimore & Ohio Railroad, and burned the train and Gunpowder River bridge. Wires were cut and communication with the north severed. At dawn, 11 July, Early marched through Rockville, McCausland, who had the advance, took the Georgetown road and by 9 o'clock was stopped by Col. Lowell, with a small cavalry force, in advance of Fort Reno. He formed Early's right. The main force, preceded by Imboden's cavalry brigade, marched for the Seventh Street road, running past Silver Spring, while Jackson's cavalry brigade moved on the left flank. Imboden's cavalry drove a small body of Union cavalry into the works on

the Seventh Street road and, dismounting, deployed as skirmishers. Early rode ahead of his infantry and arriving in front of Fort Stevens at noon, discovered that the works were but feebly manned. The northern defenses of Washington consisted of a series of detached works, at intervals of 800 to 1,000 yards, generally connected by rifle-pits, and mounting 400 heavy guns with a large range of fire. The one in Early's front, west of Seventh Street road, was Fort Stevens, with Fort De Russy on its left, from which it was separated by a deep ravine, through which ran Rock Creek, the one on the right was Fort Slocum. Fort Stevens had been furnished with a powerful armament, mostly of siege guns, well protected by embrasures and traverses. It had an extensive bomb-proof; and a hollow in the rear was capable of sheltering large bodies of men from artillery fire. Gen. Augur, commanding the defenses, had collected some heavy artillerymen, and a miscellaneous force of militia, convalescents, invalid corps, marines and sailors, department clerks and other employees of the government, and placed them under command of Gen. A. McD. McCook. The whole force, prior to the arrival of the Sixth corps, numbered about 8,000 men. The line immediately north of the city was garrisoned chiefly by the 150th and 151st Ohio regiments of 100 days' men, two or three companies in each fort, and by detachments of volunteer artillery of Gen. M. D. Hardin's division of the Twenty-second corps, whose two brigades held the entire line of sixteen forts from the Potomac, above Chain Bridge, to the Eastern branch. The cavalry, under command of Col. Lowell, consisted of detachments of the 2d Massachusetts, 8th Illinois, and 16th Pennsylvania, in all about 1,000 men, and was in advance of the works from the Potomac to Fort Stevens. When Early, who was within sight of the dome of the capitol, had seen the works, thought to be feebly manned, he ordered Rodes' division into line, in front of Fort Stevens, and, about 1.30 p.m. when the skirmishers were within range, the Union artillery in Fort Stevens, under Capt. Dupont, opened a rapid fire, clouds of dust appeared rising behind the fort, and soon a Union column was seen—a body of quartermasters' employees and 600 dismounted cavalry, under Maj. G. G. Briggs of the 7th Michigan, filing into the works on the right and left of the fort, whose skirmishers advanced to the front, before whom those of Rodes fell back, after approaching within musketry range of Fort Stevens and wounding men on its parapet. This dashed Early's hope of getting possession of the works by surprise and he consumed the rest of the day in reconnoitering. Meanwhile a substantial and timely reinforcement had arrived to strengthen the Union defense. Gen. Grant had doubted whether Early had anything more than cavalry in Maryland, but had sent Ricketts' division to Baltimore, and, on the night of the 9th, a few hours after Wallace's defeat on the Monocacy, ordered Gen. Wright, commanding the Sixth corps, to march his other two divisions from the lines before Petersburg to City Point, 14 miles, where he arrived at daylight of the 10th, took transports and by 2 p.m. of the 11th arrived at Washington, where, just arrived, was a steamer with 800 men of the Nineteenth corps, who, having reached Hampton Roads from New Orleans, had been sent directly

WASHINGTON

to Washington. President Lincoln was on the wharf to greet the troops on their arrival. Wright quickly landed his troops and marched them to near Fort Stevens, where he bivouacked, sending 900 men to relieve those that had been thrown out in front of Fort Stevens; being old soldiers, they immediately intrenched. Late in the evening 1,500 quartermasters' employees, and 2,800 convalescents, under Col. Frank Price, from nearly every regiment in the Army of the Potomac, took position in rear of Fort Slocum, and in the rifle-pits on either side of it.

After nightfall Early called a council of his division commanders, and a conclusion was arrived at to assault the Union lines at daybreak next morning, the 12th, but, during the night a dispatch was received from Bradley T. Johnson, near Baltimore, that two corps had arrived from Grant's army, and this caused Early to delay the attack until he could again examine the works. As soon as it was light enough to see he rode to the front and saw that the works were lined with troops, and gave up the idea of capturing Washington, but decided to remain in front of the works during the day and retire at night.

At dawn of the 12th Early was seen in position, with part of his command, at the Rives House, on the right of Silver Spring road, on rising ground, surrounded by shade trees, with an orchard near, giving cover to sharpshooters, who commanded the Union skirmish line from this point and also from McLay's House on the left of the road. Wheaton's brigade of the Sixth corps was thrown out on the skirmish line in front of Fort Stevens and instantly the Confederate sharpshooters began their work. Skirmishing continued until the middle of the afternoon, when Wright pushed out Bidwell's brigade of the Sixth corps, formed in two lines with orders to join Wheaton in an attack upon the Confederates at the Rives House. The guns of Fort Stevens and Fort Slocum opened a rapid fire and at a signal from Wright, who stood on the parapet of Fort Stevens, President Lincoln at his side, Bidwell moved forward, and with Wheaton's brigade, which formed an advance line, drove the Confederates from the Rives House and, after a sharp fight from rising ground beyond, and back for a mile upon Rodes' main line, where farther advance was stayed, but the skirmishing was kept up until late in the night, and the ground gained intrenched. The engagement was witnessed by cabinet officers, other officials and some ladies from behind the parapet of Fort Stevens, where also the President was ordered by Gen. Wright, when the engagement opened and men were being wounded on the parapet. The Union loss was over 200, of whom 150 were of Bidwell's brigade, including two regimental commanders of the brigade killed and others wounded.

On the left, near Fort Reno, Lovell's 900 cavalry had heavy skirmishing with McCausland's cavalry brigade, and drove it back on the Georgetown road until infantry came to McCausland's support. That night Early fell back through Rockville, marched all night and halted near Darnestown. Lovell's cavalry pushed after Early on the morning of the 13th as far as Rockville, where it was attacked and driven back by McCausland, with a loss of 30 killed and wounded, after taking 38 prisoners. At soon Wright marched after Early with two divi-

sions of the Sixth corps, followed by Emory's division of the Nineteenth corps. Early resumed his march from Darnestown and crossed the Potomac at White's Ford, near Leesburg, on the morning of the 14th, heavily laden with the spoils of war. The Union loss during the three days was between 350 and 450. Early left 30 dead and 70 wounded on the field and lost over 200 prisoners, not including his wounded. The loss on both sides was comparatively small, but the event is memorable in that it was the only occasion in the history of the country, where hostile armies met so near the seat of government, and men fell in battle within the boundaries of the District of Columbia. Consult: 'Official Records,' Vol. XXXVII; Early, 'The Last Year of the War for Independence'; The Century Company, 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Washington, Ga., village, county-seat of Wilkes County; on the Georgia Railroad; about 55 miles, in direct line, northwest of Augusta. It is the northern terminus of the Washington Branch Railroad (Georgia Railroad), which connects at Barnet with the main line. Mineral springs noted for their medicinal properties attract here many health-seekers. The surrounding country is devoted mainly to agriculture. The manufactures are flour and lumber products. The principal buildings are the county court-house, six churches, and the schools. It has a high school, opened in 1893, Saint Joseph's Academy (R. C.), public and parish schools, and Saint Joseph's Orphanage. There are two banks having a combined capital of \$112,000 and deposits amounting to \$241,000. Pop. (1890) 2,631; (1900) 3,300. The population of the town of Washington, which is a part of the village in industrial and commercial life, is (1910) 3,065.

Washington, Ill., city in Tazewell County; on the Chicago & Alton, the Toledo, Peoria & Western, the Atchison, Topeka & Santa Fé R.R.'s; about 11 miles east of Peoria and 65 miles north of Springfield. It is in an agricultural region. It has wagon and carriage works, a furniture factory, flour mill, and grain elevators. There are a public high school, established in 1876, a public library, and two private banks. Pop. (1910) 1,590.

Washington, Ind., city, county-seat of Daviess County; on the Evansville & Indiana and the Baltimore & Ohio Southwestern R.R.'s, about 100 miles southwest of Indianapolis and 20 miles east of Vincennes. It is in an agricultural and coal-mining region, and in the near vicinity there are nine large coal mines. The chief manufacturing establishments are railroad shops, flour mills, foundry and machine shops. There are extensive shipments of coal, grain, live-stock, flour, and vegetables. The city has four banks which have a combined capital of \$165,000, and the two national banks have deposits amounting to \$836,860. It has a high school established in 1874, Saint Simon's Academy, public and parish schools, and a school library. Pop. (1910) 7,854.

Washington, Iowa, city, county-seat of Washington County; on the Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific R.R.'s; about 70 miles southwest of Davenport and 50 miles northwest of Burlington. It is in an agricultural and stock-raising

WASHINGTON

region. The chief manufacturing establishments are wagon and carriage works, cob-pipe factory, pipe-organ factory, machine shops, and creameries. The principal public buildings are the county court-house, 12 churches, the schools, banks, and business blocks. It has a high school, opened in 1867, an academy, public and parish schools, and two libraries. The five banks, two national and three State, have a combined capital of \$300,000 and deposits amounting to \$1,667,730. Pop. (1910) 4,380.

Washington, Kan., city, county-seat of Washington County; on Mill Creek, and on the Chicago, Burlington & Quincy and the Missouri Pacific R.R.'s; about 90 miles northwest of Topeka. It is in an agricultural region, in which the principal products are wheat and corn. Stock-raising is given considerable attention. The industries are connected chiefly with the farm products and the shipment of live-stock. There are a high school, a Friends' Academy, two national banks, two private banks, and a private business school. Pop. (1890) 1,613; (1900) 1,575; (1910) 1,700.

Washington, La., town in Saint Landry Parish on the Bayou Courtableau, and on the Southern Pacific Railroad; about 168 miles northwest of New Orleans. It is at the head of navigation on the bayou, and has opportunities for shipping freight by water that make it a commercial centre for a large part of the parish. There are brick and tile works, a cotton twine and yarn factory, cotton mills, and a machine shop. The principal shipments are rice, cotton, sugar-cane, and corn. The State bank has a capital of \$50,000. Pop. (1890) 1,064; (1900) 1,197; (1910) 1,528.

Washington, Maine, town in Knox County; about 25 miles east by south of Augusta. It was incorporated in 1811 and called Putnam; in 1823 the name was changed to Washington. The town contains several villages, in all of which there are manufacturing interests; the principal manufactures are barrels, staves, headings, undertakers' supplies, cabinet work, and lumber. There are five churches, a high school, and district schools. Pop. (1910) 814.

Washington, Mo., city in Franklin County; on the Missouri River and on the Missouri Pacific Railroad; about 55 miles west of Saint Louis. It is in a fertile agricultural region. It has manufactures of lumber, flour, shoes, cob-pipes, leather, musical instruments, agricultural implements, and furniture. There are made extensive shipments of packed beef and pork, wheat and corn, and lumber products. There are six churches, public schools, Roman Catholic and Lutheran schools. The city has two banks, having a combined capital of \$75,000 and deposits amounting to \$786,630. Pop. (1910) 3,670.

Washington, N. J., borough in Warren County; on the Morris Canal, and on the Lackawanna Railroad, about 61 miles west of Newark, and 12 miles northeast of Easton, Pa. It is near the base of Scott Mountain, on the south side, and is in an agricultural region. The chief manufacturing establishments are piano and organ factories, silk mills, machine shops, and furniture factory. There are six churches, a high school, founded in 1882, public elemen-

tary schools, and a school library. There are two banks, having a combined capital of \$150,000 and deposits amounting to \$738,680. Pop. (1910) 3,567.

Washington, N. C., town, county-seat of Beaufort County; on the Pamlico River, and on the Atlantic Coast Line Railway, 103 miles northeast of Wilmington, N. C. It is at the head of navigation on the river, has freight connections by water with the Atlantic coast ports and the West Indies. There are grain elevators and large warehouses; the principal exports are fish, vegetables, flour, and fruit. The town also contains barrel and sash factories, lumber and planing mills, and steam cotton gins; oyster fishing is an important industry. There are two banks, one of which is a State Bank with \$50,000 capital. The town has a high school, founded in 1899, with a school library of about 1,400 volumes (in 1904). Pop. (1890) 3,545; (1900) 4,842; (1910) 6,211.

Washington (N. C.), Military Operations at. This place, on the lower Pamlico River, was taken possession of by Col. Stevenson, with a detachment of the 24th Massachusetts, on 21 March 1862, the Confederates having abandoned it on the approach of the Union gunboats conveying the troops. Stevenson returned the same day to Newbern, but the place was subsequently occupied by Union troops and early in September 1862 was held by a small force of cavalry and infantry, with a battery of four guns, under Col. E. E. Potter, 1st North Carolina (Union) infantry, supported by two gunboats lying in the stream. At early dawn, 6 September, Potter, with the greater part of his command, started for Plymouth, leaving but a small force in the place, when Col. S. D. Pool, at the head of five companies of North Carolina cavalry and mounted infantry, dashed into the town, surprised the company of artillery in the barracks and captured its four guns. Hearing the firing, Potter retraced his steps, and after a sharp fight of three hours, the gunboats assisting, he drove Pool out and followed him eight miles, taking some prisoners. The Union loss was 8 killed and 26 wounded; the Confederate loss, 13 killed and 57 wounded. During the action the magazine of the gunboat Pickett exploded, 19 men being killed and 6 wounded.

After Gen. D. H. Hill's failure on Newbern (q.v.), in the middle of March 1863, he moved against Washington, appearing before it on the 30th, and driving in the Union outposts. Gen. J. G. Foster, hearing of Hill's movement, left Newbern by steamer on the 29th, arriving at Washington early next morning, and assumed command of its garrison, consisting of about 1,200 men, with a battery of artillery. Gen. Lee had advised against an assault on the place, and Hill proceeded to invest it. Batteries were thrown up commanding the river and the roads leading to the town, and at the end of two days communication was cut off, except by venture-some parties, who ran past the water batteries, carrying ammunition and provisions in small boats. At daybreak 1 April the Confederates opened fire from a battery of Whitworth guns on the south side of the river, at Rodman's Point, 98 of the shots striking the gunboat Commodore Hull. Foster threw up batteries on the north side of the river to draw the fire away

WASHINGTON -- WASHINGTON AGRICULTURAL COLLEGE

from the gunboats, and ordered the troops that had followed him in transports from Newbern to be landed and attack the Confederate battery at Hill's point in the rear, while the gunboats engaged it in front, but the Union officer in immediate command of the troops, considering himself not strong enough for the purpose, made no effort. On 4 April the gunboat *Ceres* ran past the batteries with a good supply of ammunition. The siege progressed languidly until the 8th, when the Confederates opened and kept up a heavy fire at the gunboats and at Fort Hamilton, on the land side of the town, to which the fort did not reply for want of ammunition. On the 9th it was discovered that the Confederates had built four batteries to the right and in front of Fort Hamilton, and fortunately two small schooners ran the blockade during the day, with ammunition, with which it was supplied. After the failure to land troops and attack the battery at Hill's Point, transports conveyed them back to Newbern, and an expedition was organized to march from that place on Washington and take the Confederate line in rear. The expedition consisted of 15 regiments, numbering 7,000 men, and was under command of Gen. Spinola, who crossed Neuse River on the 7th and, reaching Blount's Creek, found Pettigrew's brigade so strongly intrenched that after a sharp engagement on the 9th at Blount's Mills he withdrew to Newbern. The Confederates continued their fire upon Fort Hamilton from the 10th to the 13th. Several ineffectual attempts had been made to relieve the garrison, when Col. H. T. Sisson offered to do it with his regiment, the 5th Rhode Island. The transport steamer *Escort* was protected by bales of hay on her guards and deck; the troops were put on board, and, sailing from Newbern, on the night of the 13th, ran past the batteries and up the river, with not a man injured, and landed a plentiful supply of ammunition and commissary stores, much to the chagrin of the Confederates. Next morning the 5th Rhode Island was placed on the line of works. On the morning of the 15th Foster, leaving Gen. Potter in command, returned on the *Escort* to Newbern to organize an expedition to raise the siege, but it was not necessary. Hill gave up the siege, and, on the night of the 15th fell back toward Greenville. Washington continued in Union possession until after the Confederate capture of Plymouth (q.v.), when Gen. Grant ordered the evacuation of the place, as it was of no strategic importance. It was finally abandoned 30 April 1864, and a great part of the town burned. Consult: 'Official Records,' Vol. IX., XVII., XXXIII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Washington, Ohio, county-seat of Fayette County; on Paint Creek, and on the Baltimore & Ohio, the Ohio Southern, the Cincinnati & Muskingum Valley, and the Cincinnati, Hamilton & Dayton R.R.'s; about 75 miles northeast of Cincinnati and 30 miles southeast of Springfield. It is in an agricultural region. The industrial establishments are boot and shoe factories, soap factory, woolen mills, iron works, machine shop, planing mill, and flour mill. The government census of 1900 gives the number of manufacturing as 67. The four banks have a combined capital of \$300,000 and deposits amounting to

\$1,499,000. There are a public high school, graded elementary schools, a library, and private business schools. Pop. (1910) 7,277.

Washington, Pa., borough, county-seat of Washington County; on Chartiers Creek, and on the Pennsylvania, the Baltimore & Ohio, the Waynesburg & Washington R.R.'s; about 32 miles southwest of Pittsburgh. It is in an agricultural and coal region. The chief industrial establishments are tube and pipe works, steel works, tin plate and iron works, glass factories, petroleum works, machine shops, and foundries. The government census of 1900 gives 150 manufacturing establishments, which were capitalized for \$2,897,670, and in which were employed about 2,206 persons, to whom were paid annually \$1,052,616. The amount paid annually for raw material was \$2,303,113 and the value of the finished products was \$4,667,330. In January 1904 there were about 4,000 employees in the manufactories. The principal public buildings are the county court-house, erected in 1901, and which cost about \$1,250,000; the Washington Hospital, and the churches and schools. There are 27 churches, representing 13 different denominations. The educational institutions are Washington and Jefferson College, Washington and Jefferson Academy, Trinity Hall Military School, Washington Ladies' Seminary, Washington Business College, Practical Commercial College, 10 public schools, one Roman Catholic parish school, and the Citizens' Library. The six banks have a combined capital of \$1,650,000, and, excluding one private bank, the deposits amount to \$5,975,340 (January 1903). The government is administered by a burgess and council of 21 members.

Washington was first settled in 1768 by people from the northern part of Ireland. The place was incorporated as a borough in 1810; in 1901 the boroughs of North and South Washington consolidated with the borough of Washington. Pop. (1910) 18,778.

Washington Academy of Sciences, a society for the promotion of scientific learning, organized in 1898. It is an organization uniting a number of learned societies of the city, including the Anthropological Society, the Biological Society, the Geological Society, the National Geographic Society, the Medical Society of the District of Columbia, and the Philosophical Society. The last-mentioned, organized in 1871, is the oldest of the societies composing the academy. The academy and the majority of the separate societies publish 'Proceedings.'

Washington Agricultural College and School of Science (name changed to 'The State College of Washington') located at Pullman, Wash. It was founded in 1890 in pursuance of the national land grant act of 1862, endowing agricultural and mechanical colleges, and of the more recent national policy of endowing a school of applied science in the newer States; it was determined to unite the work of these two into one institution, of which, also the State agricultural experiment station is a part. The national government granted to the Agricultural College 90,000 acres of land, and to the School of Science 100,000 acres of land, the proceeds of the sale of which will constitute a permanent endowment for the institution. Women are admitted on equal terms with men.

WASHINGTON AND LEE UNIVERSITY

The regular courses are divided into the following departments: (1) Department of mathematics and civil engineering; (2) Department of chemistry; (3) Department of botany and zoology; (4) Department of agriculture; (5) Department of horticulture; (6) Department of English language and literature; (7) Department of economic science and history; (8) the department of mechanical engineering, including electrical engineering; (9) Department of modern languages; (10) Department of mining engineering; (11) Department of Geology; (12) Department of military science and tactics. There are also supplementary courses in physics, Latin, domestic economy and education, and the following special schools: the preparatory school, the school of agriculture, offering a three years' practical course co-ordinated with the work of the preparatory school; the school of dairying, with a special course of eight weeks; the school of pharmacy, offering a two years' course and conferring the degree of graduate in pharmacy; the school of veterinary science, offering a three years' course leading to the degree of doctor of veterinary science; the school of business, with a two years' course; the school for artisans, offering a practical mechanical course of two years. There are also a short course in horticulture, instruction in music, and a summer science school for teachers, offering both courses for advanced study and courses in scientific method and nature study for the elementary grades. The degrees of A. B. and B. S. are conferred for the completion of a four years' course in the regular departments; the study of military science is required of all male students; candidates for a degree must elect one of the other departments as major for the four years; in the more technical departments almost all the studies are required; in other departments a larger opportunity is given for election, especially in the junior and senior years. Students in any of the 11 departments may receive the degree of A. B.; those in any but the department of English language and literature and the department of modern languages, the degree of B. S. Graduate work is also provided. The buildings include the administration building, science hall, college hall, mechanical hall, Ferry hall (the dormitory for men, named for the first State governor of Washington), Stevens hall (the dormitory for women, named for the first Territorial governor), the mining building, Morrill hall (for the department of chemistry), the gymnasium and armory, the veterinary hospital, the greenhouse, the farm and dairy buildings. An infirmary was built in 1904. The scientific laboratories are well equipped with modern apparatus, the library in 1910 contained 23,000 volumes, in addition to which the experiment station library is open to students. The students in 1910 numbered 1,371, the faculty 110.

ENOCH A. BRYAN.
President.

Washington and Jefferson College, located at Washington, Pa. Three classical schools were conducted by three ministers near Washington, the earliest opened in 1780, and out of these schools grew the academies and colleges from which came the present institution. In 1787 an academy was founded at Washington under the leadership of three Presbyterian

ministers; in 1790 the court-house where the academy held its sessions was burned, and the academy suspended, some of its patrons in 1794 chartered a new academy at Canonsburg, and the opening of this school stimulated the reopening of the Washington Academy; the Canonsburg school was chartered as Jefferson College in 1802, and the Washington school as Washington College in 1806. Many attempts were made to unite the two institutions, but all failed until 1865, when the union was accomplished under the present name. Even then rivalry existed as to the location of the college, and a compromise was effected by having a part of the faculty and students at Canonsburg and the rest at Washington, in 1869, however, the college was definitely located at Washington. The control is vested in a self-perpetuating board of trustees of 31 members. The college offers three courses leading to degrees, the classical (with the degree of A. B.), the Latin scientific (degree of B. S.), and the French scientific (degree of B. S.). These three courses differ in the work of the first two years, and are alike in the last two, in having the same studies required and the same electives to choose from. There is also a course in civil engineering. To aid students preparing for the professions, courses are suggested preparatory to the study of theology, law, and medicine; Hebrew is included in the curriculum for the benefit of those studying for the ministry. There is also a preparatory department. There are seven scholarships endowed, and a large loan fund for students. The college occupies 16 acres within the limits of the town; a new library building, the latest addition to its equipment, was erected in 1903-4. The property and endowment of the college, including amounts pledged at the centennial celebration of 1902, amount in 1910 to considerably more than \$1,000,000. The students in 1910 numbered 407, and the faculty 21. The total number of alumni is 4,084, of which about 1,650 entered the ministry, 950 the law, and 460 the medical profession. Of the alumni who have obtained some distinction there have been 4 members of the cabinet, 11 governors of States, 10 United States senators, 70 presidents of colleges and universities, 20 State supreme court judges, 2 bishops of the Protestant Episcopal Church, and 28 moderators of General Assemblies.

JAMES D. MORFAT,
President.

Washington and Lee University, located at Lexington, Va. The beginning of the university was the foundation of Augusta Academy in Augusta County, Va., established by a body of Scotch Presbyterian settlers; this academy in 1780 was finally moved to Lexington, and in 1782 was chartered under the name of Liberty Hall Academy. This charter provided for a self-perpetuating board of trustees, thus taking the institution from the direct control of the Presbyterian Church. In 1796 the academy received a generous gift from Washington, and in 1798 the name was changed to Washington Academy. In 1802 the building was destroyed by fire, and the academy for several years suffered serious financial difficulties. When relieved from these embarrassments the curriculum was extended and the name changed in 1813 to Washington College. The college was closed

WASHINGTON COLLEGE—WASHINGTON UNIVERSITY

during the Civil War, the majority of its students joining the Confederate army. Its buildings were much damaged during the Federal occupation of Lexington, and about 30 years later it received a Congressional appropriation as remuneration for the damage. The college was reopened in 1865, with Robert E. Lee as president. He served till 1870, and during his administration the college grew rapidly in numbers and influence. A school of engineering was established, and the Lexington Law School (founded 1849) became a department of the college. In 1871, soon after the death of General Lee, the name of Washington and Lee University was adopted. The university organization includes three schools. (1) the School of Arts; (2) the School of Engineering; (3) the School of Law. In the School of Arts for the degree of A. B., the courses are arranged in three groups,—the language group, the English and history group, and the mathematics and science group. The work is entirely elective, with the restriction that a certain minimum of hours must be elected from each group. The degrees of A. M. and Ph. D. are conferred for graduate work. The School of Engineering offers three courses, in civil and mining engineering and chemistry; the degree of B. S. is conferred. The degree of LL. B. is conferred by the School of Law for a two years' course. Physical training is systematic and thorough, and a certain amount of regular gymnasium work may be credited toward the A. B. degree. There are 16 general scholarships in addition to high school scholarships for accredited schools, alumni association scholarships, and one law scholarship. The university is situated on gently sloping ground, the upper part of which extends toward the campus of the Virginia Military Institute (q. v.), with which it is connected by a short avenue. The buildings include the main building; the Lee chapel, in the crypt of which General Lee is buried; Newcomb hall (the library); Tucker hall (the law building); the chemical laboratory, the gymnasium; engineering hall, and two dormitories, one of which was completed in 1904. The library contained in 1910 about 50,000 volumes, including the law library. The students numbered 609 and the faculty, 42.

GEORGE H. DENNY,
President.

Washington College, located at Chestertown, Md. It was chartered as a college in 1782, being the oldest institution of collegiate grade in the State. It was the direct successor of an academy with which the Free School of Chestertown (founded in 1723) had been merged, and was established as a part of the proposed University of Maryland. General Washington gave his consent to the naming of the institution for him, and became one of the board of visitors. The college is non-sectarian, and receives an appropriation from the State. It is open to women. The college offers two collegiate courses, classical and scientific, each leading to the degree of A. B., a normal course, and a preparatory course of three years. There are no electives in the collegiate courses. The normal course extends over three years, the first year's work being the same as the last year of the preparatory course; the study of Latin after the first year is optional. Gymnasium work is a regular part of all courses. There are

a number of scholarships established by the State for both collegiate and normal courses. The buildings include the main building, normal hall (a dormitory for women, built by the State), and the gymnasium. The library in 1904 contained 5,000 volumes, the students numbered 119, and the faculty 10.

Washington College, located in Washington County, Tenn. It was chartered as an academy in 1783, and as a college in 1795, and was the first institution of higher learning west of the Alleghany Mountains. During the Civil War, and for a short time after the war, the resources of the college were seriously crippled, and only a course of academic grade was offered. Two thirds of the board of trustees must be Presbyterians, but the college is not otherwise under denominational control. Two college courses are offered, the classical leading to the degree of A. B., and the scientific leading to the degree of B. S. There are also courses in music and oratory, a preparatory department with an auxiliary department giving instruction in domestic science, and an industrial department (established in 1892-3) affording opportunity for students to pay a portion of their expenses by manual labor. The campus, consisting of 16 acres, occupies an elevated site, commanding a view of the surrounding mountains; the buildings are the recitation hall, the boys' dormitory, and the girls' dormitory. Salem Church is used as the college chapel. The students in 1910 numbered 140, of whom 100 were in the collegiate and preparatory courses.

Washington, Fort. See **FORT WASHINGTON**.

Washington, Mount, in New Hampshire, the highest peak of the White Mountains, and the highest point in the northeastern part of the United States. Its altitude is 6,293 feet; it is east of Crawford Notch. Granite is the chief rock formation of the whole mass. On the east side there are many deep gorges, and several on the north; on the west the slope is steep. The summit is rocky, with scanty vegetation compared with the lower slopes and base, where large trees are numerous. For many years a carriage road has extended to the top, and since 1869 a rack-and-pinion road has enabled tourists to ascend to the summit with ease. A United States meteorological station and a large hotel are on the summit.

Washington, Treaty of, a treaty between Great Britain and the United States, signed 8 May 1871. Under its terms the Alabama claims, the San Juan boundaries, and certain fisheries disputes were settled by arbitration. See **TREATIES**.

Washington University, located at Saint Louis, Mo. It was founded in 1853, and is a non-sectarian institution, being under the control of a self-perpetuating board of trustees of 17 members. Besides the Collegiate Department, there are engineering, law, art, and medical departments. The college confers the degree of A. B., the course is largely elective, the work of the junior and senior years entirely so; the Engineering Department offers courses in civil, mechanical, electrical, and chemical engineering, and architecture, and confers the degree of B. S. For graduate work the university confers the degrees of A. M., M. S., Ph. D., and the professional degrees of civil, mechanical,

WASHINGTON, UNIVERSITY OF—WASPE

electrical, and chemical engineer after not less than three years of successful active practice. The productive funds of the university in 1910 amounted to \$7,000,000; the library contained 110,000 volumes; the students numbered 1,024, and the faculty 145. See also SAINT LOUIS—Education.

Washington, University of, the State university located at Seattle, Wash. The first steps toward the establishing of the university were taken by the first territorial legislature in 1854, which petitioned Congress for a grant of land; an appropriation of two townships was shortly afterward made by Congress. In 1855 the legislature organized the Territorial University of Washington in two equal institutions, one located at Seattle, the other on Boisfort Plains, Lewis County; but as no further steps were taken toward the establishing of the university, the legislature united the two institutions and fixed the location in Cowlitz Farm Prairie, Lewis County. This shifting policy led the people of Puget Sound region to incorporate another university, and the fear of thus duplicating institutions led the legislature to definitely fix the location of the University of Washington at Seattle, and to appoint a board of commissioners to select and sell the granted lands and establish the university. The main building was completed in 1862, and the university opened to students in the same year. In its earlier years the university met with many difficulties, chiefly financial, as the Territory appropriated no money for its maintenance until 1879; its progress was slow until 1893, when the legislature provided a new site and appropriation for building purposes. Since that time the growth of the university has been both continuous and rapid, and it has taken its place as the real head of the educational system of the State. It is open to all without charge for tuition, except in the School of Law. The board of regents consists of seven members appointed by the governor with the approval of the Senate, for a term of six years. The university includes the following schools: (1) The College of Liberal Arts; (2) the College of Engineering; (3) the School of Mines; (4) the School of Pharmacy; (5) the School of Law. The College of Liberal Arts offers a classical, a literary, and a scientific course, all leading to the degree of A.B. In each course half the work is elective; the electives include a major study, selected at the beginning of the junior year. Most of the elective work falls in the last two years, but there is some in the sophomore year, and in the freshmen year of the literary and scientific courses. A limited amount of gymnasium work is required for the degree. Courses in pedagogy are included in the curriculum. The degree of A.M. is conferred for graduate work. The College of Engineering offers four courses, civil, electrical, mechanical, and chemical engineering, leading to the degree of B.S. The degrees of C.E., E.E., and M.E. are conferred for graduate work. The School of Mines offers two courses leading to the degree of B.S., mining engineering, and geology and mining, and a short course in mining for prospectors. Graduate work is offered which leads to the degree of E.M. (engineer of mines). The School of Pharmacy has a two years' course leading to the degree of graduate

in pharmacy, and an advanced four years' course with the degree of B.S. The School of Law provides a two years' course which leads to the degree of LL.B., and admits to the State bar without further examination. The students maintain a general association which has charge of student government, debating clubs, a dramatic club, and several special associations for members of certain departments of study. Six Greek letter fraternities, and three sororities have chapters at the university. The university grounds comprise 355 acres lying between Lakes Union and Washington; the plan for the arrangement of the buildings is a modification of the quadrangle, all buildings being grouped around an ellipse, whose major axis is 1,200 feet and the minor axis 650 feet. All buildings are to be constructed of materials found in the State. The buildings erected in 1904 are the Administration Building, Science Hall, the observatory, the assay shop, two dormitories, one for men and one for women, and the gymnasium, containing separate exercise rooms, dressing rooms, and equipment, for men and women. The scientific laboratories are well equipped with modern apparatus; the library in 1910 contained 42,000 volumes; in addition to which the university owns the library of the School of Law, 1,000 volumes, and a special library of American history, 350 volumes. The students numbered 2,156, besides a summer session enrollment of 114, of whom 509 were in the College of Liberal Arts, and the faculty 113.

THOMAS F. KANE,
President.

Washita, wosh'-ta, or Onachita, a river which rises in Polk County, Ark., and flows east then south into Louisiana, entering the Red River in the east central part of the State. The chief tributaries are Saline, La Fourche, Tensas, and Little Missouri. The part of the river below the point where the Tensas enters is often called the Black River. The Washita is navigable throughout the year as far as Camden, Ark., and for about eight months to Arkadelphia, Ark. The total length is about 600 miles.

Wash'o Indians, a linguistic stock of North American Indians, consisting of the Washo tribe, whose original range extended from Reno, on the line of the Central Pacific Railroad in western Nevada, to the lower end of Carson Valley. The vicinity of Carson is now the chief seat of the tribe and here and in the neighboring valleys there are about 200 living a parasitic life about the ranches and towns.

Wasps, hymenopterous insects, typically belonging to the family *Vespidae*, in which the head-shield is square and the mandibles or greater jaws short and toothed at their tips. The wings are folded once longitudinally when at rest. The antennæ of the males are 13-jointed, those of the females and neuters or workers 12-jointed. The abdomen is egg-shaped and often borne on the thorax by a slender stalk.

The true wasps differ considerably in appearance and greatly in habits. Some of them live in pairs and construct simple cells of mud which are attached to twigs, beneath stones, etc., and stored with paralyzed spiders and insects upon which the larvæ feed; others burrow

into the stems of plants or the ground and provide for the young in a similar manner. All such are known as solitary wasps, to distinguish them from the social or colonial wasps, and are sometimes separated as a distinct family (*Eumenidae*). The true social wasps are all paper-makers and their nests are sometimes of large size and shelter a great many individuals. Unlike the solitary wasps which are of perfect males and females only, the social wasps produce in addition a caste of "workers" or infertile females.

Eumenes fraternus is a well known solitary wasp, easily recognizable by the long and slender pedicel formed by the basal segment of the abdomen, the short square thorax, and long jaws. Its nests are dainty spheres about half an inch in diameter constructed of mud pellets and attached, often several in a row, to twigs or walls, and sealed after being provided with a fertilized egg and a supply of caterpillars. *Odynerus* and several related genera having very similar habits have the abdomen sessile. They are often gaily colored and some of them place their mud cells within hollow galls or the deserted nests of other insects. *Raphiglossa* forms burrows in the pithy stems of briars and stores its cells with the larvae of weevils. Of the social paper-wasps the species of *Polistes* somewhat resemble *Eumenes* in the slender more or less petiolate abdomen. All of the numerous species build a single tier of cells supported by a central pedicel and unenclosed in a covering. Several of the species are very common and well known. In *Vespa* the abdomen is broad, robust, and sessile, and most of the species, which include the hornets and yellow jackets, are brightly striped with yellow on a black or brown-ground color. The members of this genus exhibit the largest and most highly developed wasp communities. A common large species is *Vespa maculata*, which builds the large oval grayish paper-nests so well known. Externally they consist of several loose covering layers pierced by an aperture at the lower end. The interior is occupied by horizontal tiers of combs, like floors in a house, supported by columns, and with passages between. Each cell is hexagonal, as in the combs of bees, but the material is paper. These tiers of cells are built in succession, the upper ones first. Sexually wasps are of three kinds, males, females, and neuters, the two latter armed with an exceedingly venomous sting. The last are the workers in the hive; they also go out to bring in provisions for the community. Wasps are nearly omnivorous, feeding on honey, jam, fruit, butcher's meat, and any insects which they can overpower. A share of these viands is given to the males and females, whose work lies in the vespiary and in providing for the future progeny of the colony. The cells of a large nest may amount to more than 15,000. In these the females, which are few in number, deposit eggs, hatched in eight days into larvae. These go into the chrysalis state in 12 or 14 days more, and in 10 more are perfect insects. The males do no work. Most of the workers, all the males, and the old females, die at the approach of winter, and in the spring each surviving female, having been impregnated in autumn, looks out for a suitable place to form a new vespiary, and builds a few cells in which are deposited eggs destined to produce workers. The latter then assume the

duties of nest-building, and the number of cells is rapidly increased to provide places for the eggs which the female continues to lay throughout the summer. *V. arvensis* is a smaller species of a richer yellow color and similar habits. The yellow jacket (*V. vulgaris*) builds similar nests in an underground chamber reached by a tunnel, and the large European hornet (*V. crabro*), naturalized in portions of the United States, nests in hollow trees.

The mud-dauber wasps belong to a distinct family (*Sphecidae*). These have the greater part of the abdomen in the form of a bulb borne on a very long and narrow stalk and the head is supported on a distinct neck. The black and yellow species of *Polistes* make the familiar rough mud-cells which are so commonly plastered to the ceilings of barns, outhouses, and garrets, and which are packed with spiders at once paralyzed and preserved by a thrust of the sting through the nerve ganglia. Many of the numerous other genera of this family burrow into banks or along paths, but all have the habit of provisioning the nest with spiders or caterpillars. Some of them are very large and handsome wasps. A related family of burrowing or "sand" wasps is the *Pompilidae*, which have long, non-articulated antennae and rather small eyes. A very fine large species (*Pepisiformosus*), found in the Southern States, is known as the tarantula-killer from its habit of attacking that huge spider, with which its cells are stored. Not infrequently a very large wasp, with a stout, heavy body about 1½ inches long, is seen half flying, half walking, burdened by a cicada which it has captured and is bearing off to its burrow. This is *Sphecius speciosus*, a representative of the family *Bembecidae*, which, like the last two, has the wings unfolded when at rest. Still another interesting family of fossorial wasps is the *Mutillidae*, or wingless wasps. Most of them are richly colored and hairy; and are seen running in sandy pathways. They are commonly mistaken for ants, but sting severely. There are numerous other wasps which cannot be even mentioned. Suffice it to state that the North American fauna includes about 1,500 known species, arranged in 17 families.

V. and VI. (New York 1895).

Wasson, wă'sŏn, David Atwood, American clergyman and author: b. Brooksville, Me., 14 May 1832; d. West Medford, Mass., 21 Jan. 1887. He entered Bowdoin College in 1849, but remained only one year; went to sea in search of health; studied law and for a short time practised; and in 1848 entered the Bangor Theological Seminary. In 1851 he became minister of a Congregational church at Groveland, Mass., took charge there of an independent society with which he remained until 1857, with an interval of six months at Worcester, Mass. In 1865 he was called to the Twenty-eighth Congregational Society (Theodore Parker's), Boston, but soon retired on account of illness. Afterward he resided for several years

in Germany, and finally settled at West Medford. A profound thinker and writer, of striking originality, and with a style equally powerful and brilliant, Wasson contributed in prose and verse to various periodicals—the 'North American Review,' 'Atlantic Monthly,' 'Christian Examiner,' 'Radical,' etc.—his subjects including political philosophy and government, economics and religion, ethics and social reform. The principal collection of his verse is the volume of 'Poems' (1888), edited by Ednah D. Cheney, including 'All's Well,' a classic of faith; 'Babes of God,' a poem of Wasson's optimistic philosophy; 'Seen and Unseen'; 'Ideals'; 'Orphans'; 'Scipio to the Senate'; and others, equally striking in thought and expression.

Waste, or By-products. Waste is such material as is rendered either wholly or partially useless in the manufacture of products and articles of all kinds, but the name is sometimes retained long after a substance, at one time of little or no value, has been utilized. When iron ore is smelted, or coal distilled, or common salt converted into soda, waste in some form results from the operations. In every manufacturing process, mechanical or chemical, there is waste. The examples given relate to new waste, but nearly everything we use wears, or corrodes, or gets broken or unshapely, and so rags, and rust, and scraps arise. On the other hand, the rust which arises from corroding iron is utter waste, since it can never be profitably collected at all. In respect to the value of "waste," these two, among familiar things, may be taken as at opposite extremes. There is a kind of waste, for the most part difficult to prevent, which goes on in the consumption of fuel, and in certain processes of roasting or calcination in the smelting of metals. Roundly speaking, the best designed steam-engines and boilers require only half as much coal per horse-power per hour as those less skilfully constructed, and the fuel unnecessarily consumed by bad boiler furnaces is largely wasted as smoke through imperfect combustion. The utilization of blast furnace gases for heating purposes, and the recovery of tar and ammonia also produced by the coal consumed in these furnaces, form an instance of a double saving from the same source. In the report of the chief inspector of alkali works for 1891, it is stated that the plant put up in recent years for collecting tar, ammonia, etc., at 57 Scotch blast furnaces cost \$2,223,000, a sum fully equal to the cost of building the furnaces themselves. The condensing flues, miles in length, connected with some lead-smelting furnaces are modern examples for appliances to condense lead fume or smoke which formerly was allowed to escape, causing much loss of lead.

Some instances of how waste in a solid form arises in working rock and other mineral substances may now be given. In shaping and dressing granite paving stones as much as three fourths of the rock quarried is, in some instances at least, wasted. This waste is as yet only very partially utilized for road metal, and in small chips for "granolithic" pavements. The oil shale of the carboniferous formation in Scotland, from which paraffin (q.v.) and paraffin oil are obtained, was itself looked on as of no value till 1869. Blast furnace slag is now utilized in sev-

eral ways, and in a number of cases the accumulations of other kinds of slag on the sites of ancient smelting works have, in modern times, been again put through the furnace to extract the metals left in them, with profitable results. Some of the refuse from the old silver mines of Laurium has been bought up by capitalists for this purpose. One instance, though not of very recent date, may be given where, by the production of a by-product, a fortune was very quickly amassed. About 1840 Mr. Askin of Birmingham discovered a method of separating cobalt, in the form of oxide, from nickel, two metals which were very difficult to separate. This oxide of cobalt was at first a waste product, but before very long it was put into the hands of potters, who readily bought it up to produce a blue color on their ware, at the then rate of two guineas per pound. Among comparatively recent instances of utilization of by-products and waste products in the chemical industries, we may refer to the importance of the substances now extracted from coal tar (q.v.), and the great value of some of them in the manufacture of dyes. Another example is the recovery of binoxide of manganese in the production of chlorine for the manufacture of bleaching powder by Weldon's beautiful process. Formerly for every 100 pounds of bleaching powder made about 100 pounds of the native oxide of manganese were required. Now this manganese is recovered and used again and again in the process, with only a loss of about 5 per cent to make up each time it is returned to the chlorine still. The earlier methods of recovering manganese were not nearly so perfect, and therefore were not much used. A process for the utilization of chemical waste on a great scale is Chance's method, patented in 1868, of recovering sulphur from alkali makers' black-ash refuse.

Passing to vegetable substances, the various materials besides rags used in the manufacture of paper may be first noticed. Straw, wood, and esparto fibre, if not exactly waste products, were at least undeveloped substances before they became, as they now are, so largely used in paper making. Old ropes, flax, and jute mill waste, old or torn pieces of paper of every kind, are all serviceable in paper mills or in the manufacture of millboard. In the pulp of the latter old newspapers bulk largely. Cotton waste is much used by mechanical engineers for cleaning purposes. Sawdust is employed in several ways. Corkcutter's waste has become of high importance in the manufacture of linoleum and cork carpet. From the bark stripped from osier wands the useful medicine salicin is now made. In days not so long past the spent madder of our large dyeworks was suddenly raised from a useless to a valuable material by treatment with sulphuric acid, which converted it into the dye called garancin. Madder itself, which till 1869 held a chief place among our dyestuffs, has since become of trifling importance, through the introduction of alizarin (q.v.). From the seaweed thrown up on British shores iodine is obtained, but, though some is also used as manure, much of it is allowed to decay. One of the most interesting examples of what has been done in converting a waste animal product into a highly useful material is seen in the case of waste silk. Cocoons do not yield half their weight of reeled silk, but the remaining "waste"

WASTE—WASTES

portion has, through the ingenuity of an English inventor, become the raw material for a large spun silk industry. In Venice artificial flowers for ladies' headdresses are made of imperfect cocoons. The various kinds of waste from woolen mills and from the cutting up of woolen fabrics are either worked up again into yarn or felt, or are ground into flock for paper hangings. Glue (q.v.) is made from parings of hide and from bone. The turnings and dust of the ivory and bone turner have various useful applications. Prussiate of potash is made from almost any waste animal matter, such as parings of horns and hoofs, hair, blood, leather cuttings, and even field mice.

Waste, in law, the result of any act or omission by the tenant of any particular estate by which the estate of the remainder-man is rendered of less value. Waste is of two sorts, voluntary and permissive; the former being that caused by active procedure on the part of the tenant, such as the destruction or alteration of buildings, the latter that caused by negligence, such as the allowing of buildings to fall out of repair. On the theory of permissive waste as developed at common law is based the rule which throws upon the tenant the responsibility of making all ordinary repairs in the premises which he occupies. Though he cannot strictly be required to make repairs, and is not liable in damages for any failure so to do, yet in case of an action for waste against him his only defence is a demonstration that he has repaired the waste, and he therefore prefers to maintain the premises in repair.

Wastes, City, Disposal of. The public wastes of a city which must be cared for by one of the municipal departments, commonly the department of street cleaning, consist of street sweepings, dead animals, condemned market material, household refuse—garbage, ashes, and general rubbish; and trade waste—paper, packing material, etc. When these have been collected, it is necessary for the department of street cleaning to make the most economical and least obnoxious final disposition of the various products of its industry. Many, and indeed most, of the materials collected have a definite and considerable value when separate from material of other classes, but a mixture of the various kinds of refuse has no value except the little which can be produced by separating the materials by hand picking.

In any large city the proper treatment of these materials calls for their collection in five separate classes: (1) Street sweepings; (2) dead animals; (3) household garbage and market waste; (4) ashes; (5) household rubbish—cans, bottles, paper, rags, bits of metal—and trade waste. When a city population exceeds say 100,000, the amount of waste is sufficient to warrant this classification, because the resulting economies will counterbalance the attendant trouble and expense of keeping and collecting the materials separately.

(1) Street sweepings consist of about two thirds horse droppings and one third dust and scrap of one kind and another. These sweepings are not satisfactory as a lowland filling because of the large proportion of organic matter; and on the other hand the material has small value for fertilizing purposes because even well kept stable manure has a value of only about \$0

per ton, wholesale, on the basis of the price of manufactured fertilizers; and street sweepings, from their admixture with other dirt, have a fertilizing value of only about \$1.35 per ton. It is evident that such material cannot be shipped far, because its value would soon be equalled by charges for handling and transportation; and the best disposition that can be made of it is to send it out as a farm and garden dressing as far as its fertilizing value will pay the freight. Before the days of high grade fertilizers, such material had a relatively higher value, but nowadays, only in small cities where market gardens and farms are not greatly distant from the centre of population, have street sweepings any commercial value at the point of collection. In 1840 New York city sold its street sweepings and manure for \$38,711; in 1850 the amount received was \$30,898, in 1860 the amount was \$17,928; and all receipts from this source ceased not many years later. In smaller cities, however, while the cost of sweeping the streets will apparently always be a charge on the citizen, the value of the sweepings collected from paved streets ought to pay for their final disposition.

(2) In the matter of dead animals, it is customary to contract with some individual or firm for their prompt collection and removal; and though this is considered a service and is nearly always paid for by the city, yet the value recovered by the contractor from the hides, bones, grease and fertilizer-material goes a long way toward equaling the expense of collection and disposal; and there is good reason to believe that the value of this material when scientifically treated is sufficient to meet the total expense.

(3) The third class, household garbage (q.v.) and market waste, is the division which causes most trouble and expense in any city, large or small. In seaport towns it has usually been cheapest and easiest to tow the mixed wastes to sea and to dump them so far from shore as to be practically unobjectionable. Inland cities and towns, however, have found great difficulty in disposing of organic waste, because the method of disposition adopted must be satisfactory at once to the community and to its neighbors. These municipalities have usually endeavored to sell their edible waste, even if not very fresh, for use as food in large piggeries. Many, too, even within recent years, have used it as food for milch cows. But consumers of the pork and consumers of the milk have gradually risen in protest, and guardians of the public health have urged many reasons why the practice should be abolished. The revenue derived from it and the difficulty of finding a better method have been serious obstacles to change; but the practice has generally given way to the compost heap, which in turn has usually died an early death from the vigorous objections of its neighbors.

When mechanical methods were sought, the first impulse naturally was to *destroy* an article which had been the source of so much danger and trouble; the second impulse was to *save* a substance which was known to be valuable. The development of these two ideas has led to the invention of incinerating and utilization methods, respectively. The term garbage is used here to signify only table, kitchen and market refuse, consisting of animal and vegetable scrap, always wet and putrescible. The composition of this material varies with the season and with

WASTES

the city, but the average in America is approximately: Water, 70 per cent; grease, 3 per cent; solid fibre, 27 per cent. Such material cannot be burned until its 70 per cent of closely-held water has been freed and evaporated; and, on the other hand, its grease and fibre have commercial value if they can be separated from the water and from each other.

Every housekeeper knows that small amounts of garbage can be quickly disposed of by a good fire; but when the endeavor is made to destroy a large amount of garbage by a poor fire, the trouble begins. In all cases noxious fumes are produced, and escape unless the temperature is high—2,000° F. or more, and freedom from offensive odors is gained only at the expense of fuel. The organic fumes must be decomposed and destroyed within the furnace itself, and therefore the process must be one of complete combustion and not mere evaporation or distillation. When a small amount of garbage is mixed with a large amount of paper, excelsior, shop sweepings, and waste coal and clinker, the incineration process is neither difficult nor costly; and is permissible in the outskirts of a town or city where there are no neighbors within a mile to be troubled by the fumes which in practice always escape with the chimney smoke and come to the ground at a greater or lesser distance according to the force of the wind. Many city incinerators for this kind of waste destruction are in use in the United States and Canada; many of practically the same class have been in use in England for a long time, and from there the practice has extended to Hamburg and some other places; but none of these incinerators endeavor to burn pure garbage, but always the mixture above mentioned. As a matter of fact, there is enough heating power in a pound of dry garbage to evaporate the water from the next pound, and therefore there is no reason why a furnace cannot be so constructed that each pound of garbage may dry the next succeeding pound, and garbage thus be made to burn itself, with only enough added fuel to insure the destruction of fumes.

Garbage utilization processes all aim to extract the grease by cooking in steam or in naphtha, after which the solid material or fibre is dried and ground to form a fertilizer base. The recoverable grease amounts to about 60 pounds per ton of raw garbage, and is salable at about 3 cents per pound. The dry fibre averages 540 pounds per ton of winter garbage, and derives its value from the presence of ammonia—18 pounds @ 8c.=\$1.44; phosphoric acid—18 pounds @ 1c.=18c.; potash—6 pounds @ 3½c.=21c., or a total recoverable value of \$3.63 from a ton of raw winter garbage. Summer garbage is less valuable because it contains more water and less grease and fibre. The cost of treatment, when the quantity is large, is less than the value of the material recovered. In American cities the amount of garbage collected averages about a half pound per citizen per day; in Europe it averages less than a quarter pound. Many people object to keeping separate garbage cans because of the odors which arise unless the water is absorbed by a mixture of ashes, paper and other waste; but in a large city where garbage is collected daily, it is evident that material which has come from the table within 24 hours must be odorless and unobjectionable, and that the odors arise solely from the cans, and from

them only because they are not regularly washed and kept clean.

(4) Ashes are always available for lowland filling, and steam ashes are particularly sought by builders for use in fireproof floors, as a foundation for the cement floors of cellars, and as a substratum for sidewalks and flagging. The ash output amounts in the northern parts of America to nearly three quarters of a cubic yard per citizen per year, and many efforts have been made to utilize its various constituents so as to save the cost of carting or boating it away for filling purposes. Ordinary household ash from anthracite coal consists of: Fine ash, 50 per cent; coarse ash, stone and clinker, 30 per cent; coal, 20 per cent. Such recovered coal has a ready cash sale, and while the daily value of the ash from a single building is probably too small to pay for its separation, yet the process may be profitable when conducted on a large scale, in proper buildings, and aided by mechanical means of separation. This recovered coal has an average heating value of about 75 per cent of that of new coal and has many advantages as household fuel because of its ease of ignition, and its freedom from dust, clinker and slate. In the borough of Manhattan, New York, the annual output of ash is not far from 1,500,000 cubic yards, or 1,200,000 tons, and the amount of recoverable coal contained therein is not far from 250,000 tons. If the ash collections are kept free from street sweepings and garbage, the recovery may be made by a machine capable of separating coal from clinker; and the value of the recovered coal will be nearly sufficient to meet the expense of ash collection and disposal.

(5) The class of waste including general rubbish—cans, bottles, old rubber, paper, rags, bits of metal, etc.—is a perennial delight to scavengers, who withstand dust and smells in order to pick out these things from a mixed mass of animal and vegetable refuse. But since city authorities have learned to keep the different classes of waste separate, this rubbish has become a source of revenue to the city even after paying the cost of collection and sorting. Old cans are sold at \$3 per ton for their solder and value as material for cheap castings. Bottles are of two classes, "registered" goods—bottles which have the proprietor's name blown in the glass—and plain bottles without names. The average price, at the place of collection, for "registered" bottles, which by law may be sold only to their original owners, is one cent each. Plain bottles are put into barrels and sold to dealers at \$1.50 per barrel. Broken glass, too, has a market value of 10 cents per bag. Rubber scrap is worth 5 cents per pound at the rubber-reclaiming factories. Waste paper, when clean, is worth from \$4 per ton for newspapers to \$40 per ton for fine white paper, the average price for the paper collections of a city being about \$9 per ton. Rags vary in price, as do papers, many of the rags being used for paper stock. These materials have such value that only a small proportion reaches the carts of the department of street cleaning. The large proportion is collected by house to house visitation by junk-cart men, of whom there are in the borough of Manhattan, for instance, some 400, whose purchases amount to about \$1,000 per day; and only the balance is collected by the department carts. An idea of the extent of the trade in these waste materials may be gained from the statement that

WATAUGA ASSOCIATION—WATCHMAKING

the yearly collection of old rubbers in the United States amounts to about 17,000 tons, of which some 600 tons per year, worth \$50,000, are collected in the borough of Manhattan. Some of the other yearly collections in Manhattan are as follows: "Registered" bottles—principally syphon bottles and those used for carbonated waters, soda and beer—2,000,000, worth \$20,000; plain bottles, 30,000 barrels, worth \$45,000; waste paper, \$2,000,000 worth; rags, \$75,000 worth; bits of carpet, string, iron, brass, etc., to the amount of several thousand dollars more. Though, as said above, only a small proportion of these things goes to the waste heap, yet, since the department has provided separate carts for dry rubbish, the city has received annually nearly \$100,000 for the delivery of these collections to contractors at the docks. The various materials are delivered mixed from each cart, and some \$150,000 is paid annually by the contractors to laborers who sort the waste into separate piles, after which it is sold to various dealers. Allowing a reasonable profit to the contractors, it is probable that the amount received by them is not less than \$300,000. Therefore these bits of scrap thrown away by the housekeeper have become worth \$100,000 by their collection at the receiving station, and have become worth \$300,000 by separation into their component parts.

The problem of the general separation of waste materials is simple in the household but difficult in the community. It is all a matter of education in ethics and community economy, and requires strict rules with sure penalties for infraction. If each member of the population would increase the salable value of his household wastes one half cent per day by keeping these wastes separate, the total amount would be sufficient to defray all the expenses of the department of street cleaning in any city in the United States. See STREET CLEANING.

C. HIESCHEL KOYL,
Consulting Engineer.

Watauga Association. In American history a name adopted by a party of settlers who established the first independent civil government in North America. In 1768, the Six Nations (q.v.) agreed to surrender all the lands between the Ohio and Tennessee Rivers. The first settlers were largely from Virginia and the first settlement was made on the banks of the Watauga River in 1769. The Watauga Association, established in 1772 by John Sevier, James Robertson and others, subsequently grew to be the State of Tennessee. Under the title "Articles of the Watauga Association," a written constitution was drafted, the first ever adopted by a community of American-born freemen. See SEVIER, JOHN.

Watchmaking, Modern. It is an accepted fact of horological history that the portable mechanism from which has been evolved the modern pocket watch had its origin in Germany. And until the last half of the 19th century the watchmaking industry was confined to a few European countries, particularly to Switzerland and England.

The methods employed by all European watchmakers involve a great degree of individual skill on the part of the various workmen, a skill which can be acquired only by years of application and experience. But as it

is the custom in the watchmaking districts of Europe for the children of a family to adopt the line of work pursued by the parents, the acquisition of superior manual dexterity would tend to be both natural and easy. Such skill would, however, lie within narrow limits. For instance, the members of a certain family would for succeeding generations be engaged in the making of a given piece or portion of the watch, one family making wheels, another regulators, another dials, etc. The several parts produced by these various families being brought together by still others, who fitted them to each other and sold them in the form of completed watches. Practically the same methods were in use in the watchmaking districts of England. But while watchmaking in England has to a great extent declined, the Swiss are still largely engaged in the business, but their methods have been materially modified through the introduction of American machines.

It may be properly said that Europeans made watches by long used methods, while Americans made a radical departure from established ways and originated a system, the foundation of which may be briefly stated as the substitution of impersonal machines for the acquired skill of the individual workman. A half century of continued growth has given practical demonstration of the correctness of the theory on which this system was founded. It is conceded to have had its theoretical origin in the mind of Aaron L. Dennison, a young Boston watchmaker, who in 1849, after months of planning and endeavor, succeeded in enlisting the co-operation of Edward Howard and his partner, makers of accurate instruments of various forms. Having secured capital to the amount of \$20,000, they built a small factory in Roxbury, where about four years was spent in preliminary work and in the production of a few hundred watches. In 1854 a new factory was built in Waltham, Mass., about ten miles from Boston. This factory, after numerous changes and additions, now exists as the oldest watch factory in America and the largest in the world. Here really began the manufacture of watches on what is now known as the American system, so that it may fairly be said that modern watchmaking belongs peculiarly, if not exclusively, to America. We have said that the American system of watch manufacture employed machines as a substitute for the acquired skill of the individual workman. But the foundation of the system is that of practical uniformity in the measurements of large numbers of any given parts of watch movements, so as to permit of interchangeability.

Manufacturing on the basis of interchangeability may be said to have been in its infancy at the middle of the last century. Doubtless that system had its finest exponent at the time in the United States armory at Springfield, Mass., where were manufactured muskets for the use of the army. Mr. Dennison believed that, notwithstanding the diminutive character of watch parts, as compared with muskets, it would be possible, by the employment of suitable machines, to manufacture large numbers of such parts of such exact uniformity as to be readily interchangeable. The original American watch factory was therefore planned on that theory. But to fully equip a watch factory with tools and machines capable of producing work

WATCHMAKING

in that systematic way, would involve the employment of very large capital. The original factory was not fortunate enough to command sufficient confidence of capitalists to enable it to do more than make a beginning, but accomplished enough to demonstrate the practicability of the system. Its development has, however, been continuous, until at the present time machine watchmaking has to a limited extent been adopted in Switzerland, while the old methods of manufacture in England have declined to such an extent that there now remains but a small per cent of the former business.

A watch is really quite a simple machine, containing an average of about 150 distinct parts. By actual count it has been found that the production of all these parts requires over 3,700 distinct operations. It will, therefore, be readily understood that the manufacture of watches on an extensive scale is one of the most complex and exacting manufacturing problems ever undertaken. It calls for high grade talent in almost every direction, and involves an intricacy of detail which can be mastered only by years of study and experience.

This being the fact, it will be hopeless to attempt more than a brief and fragmentary description of a few of the manufacturing processes involved; and it should be understood that the methods employed, and the means used, are not identical in all American watch factories, but doubtless they are as diverse as the factories themselves. It will therefore be best to indicate the most advanced methods only, which in the nature of the case can be found only in a large factory, possessing the absolute requisite of plenty of capital; for high grade automatic machinery is of necessity quite expensive, while at the same time its productive capacity exceeds the requirements of a small factory.

Beginning then with the foundation of the watch movement—the "pillar plate"—it should be said that these larger parts (which in the cheaper grades of watches are of brass, and in the better grades are of nickel alloy) are made at brass mills, from dies furnished by the watch factories, and are received in the form of blank "punchings." After these blanks have been carefully cleaned they are placed in a tubular magazine located at one extreme of a "facing machine" directly beneath a "carrier," which is attached to the extremity of a swinging arm. When the machine is put in motion the carrier descends and grasps one of the plate blanks and lifts it clear of the magazine and swings around to a point directly in front of a suitable chuck or holder on the running spindle of the machine, which at that instant is not in motion. The carrier then descends until the blank is in exact line with the axial centre of the spindle. When in this position the chuck is opened to receive the blank, which is pushed into the waiting chuck, which immediately closes tightly upon it. The carrier then rises and swings to a position midway of its excursions. The spindle then begins to revolve at a suitable speed, and at the same time moves forward so as to bring the revolving blank into the path of a suitable cutting tool which at once commences to move toward the axial centre, cutting away a definite portion of

the blank, and leaving it with a perfectly flat and smooth surface. As soon as the cutting tool reaches the centre of the blank, it is withdrawn from contact and returns to its former position. At the same time a second carrier swings around from the opposite side and places itself directly in front of the chuck containing the faced blank; the grasp of the chuck is relaxed and the blank is pushed out of it and into the second carrier which at once swings around and deposits it in the chuck of a second running spindle—a duplicate of the first. In this second position the other side of the blank is faced; then a third carrier takes the now double-faced blank and deposits it in a receptacle at one end of the machine.

As the movements of the three carriers are simultaneous, and the cutting tools move in unison also, it will be seen that notwithstanding the numerous operations which succeed each other, a completed blank is deposited at one end of the machine at practically the same instant that another one is taken at the other. Slight modifications in parts of the machine provide for desired recesses on either one or both sides of the blanks. These machines do their work on plates at the rate of 1,800 per day, so that it will be seen that they are far too productive for any watch factory which is not organized for a large output.

Succeeding the facing operations, just described, comes that of drilling most of the numerous holes in the plate needful to receive the screws, pins, etc., for attaching the "top plate," balance cock, pallet bridge, etc. The ordinary method of drilling has been to clamp the blank watch plate to a master plate or "drill jig," in which were the required holes of proper size and accurately located, which holes served as guides to the various drills required. But inasmuch as the number and location of holes in such a jig were necessarily quite limited there was involved the use of several jigs to complete the drilling on each and every watch plate. Of course also an operative was required to insert and remove the plates and to manipulate the drills. Following the operations of drilling there is required the "threading" or tapping of certain holes for the reception of screws. This operation involved the repeated handling of the plates.

D. H. Church, the mechanical superintendent of the American Waltham Watch Factory, in addition to other machines in great variety, has invented an automatic plate-drilling machine capable of both drilling and tapping practically all of the holes in the watch plate, in which the only work of the attendant is to fill with blank plates the magazine at one end of the machine and remove them from a similar magazine at the other end, where they are automatically deposited, completely drilled and tapped. In some instances the operations performed on each plate number 135, and the plates are delivered at the rate of one in 90 seconds.

Following the drilling of the plates comes the turning of the required recesses in both sides to make room for some of the moving parts of the watch, such as the main-spring barrel and some of the wheels of the "train."

The automatic recessing machines are also provided with delivering and receiving maga-

WATCH MAKING MACHINERY.

WATCHMAKING

zines located at the extreme ends of the machines, and between them are a number of parallel heads each provided with a running spindle and "chuck," and in suitable relation to each a compound slide rest carrying a special cutting tool adapted to the work to be done. Carrying arms automatically take the plates from the magazine and the successive chucks and transfer them to the next in order. But this transfer must be done with the utmost exactness, for the plates must be so held in the various chucks that the axis of revolution shall in each successive operation be in a new but definite part of the plate. Moreover, the plates are located and kept with utmost precision in their proper position by guide pins in each of the clamping chucks, which pins correspond in relative position with certain of the drilled holes in the plates. It is needful therefore that, as the plate is presented to each succeeding chuck, its guide pins shall be exactly in the proper position to enter the hole in the plate. The attempt to attain the required exactness of movement was regarded at first as a bold one, but complete success justified the hopes and expectations of the inventor.

The other supporting plates of the watch are treated in the same manner as the pillar plates above described, their differing forms of course demanding correspondingly differing chucks and holders.

For numerous succeeding operations of boring, turning, milling, etc., special machines are provided, many of them being exceedingly interesting in their intricate movements, but impossible of any brief description.

The American system includes the production of every portion of the watch in one establishment, but in very few even of the American watch factories has this ideal been attained. The fact that certain components of the watch, such as dials, hands, mainsprings, etc., which do not demand extreme exactness in fitting, can be imported from Europe, or produced in special factories, has enabled a number of incomplete factories to turn out watch movements, in considerable numbers, without the investment of large capital. But the original American watch factory is equipped for the production of every part of the watch movement, down to the delicate little taper pins used to confine the ends of the hairsprings. By means of special machines these little pins are made at a rate exceeding one in two seconds. Even the fragile enamel for coating the dials is manufactured from the raw materials; as also the pure gold ornaments used to embellish "fancy dials." These things, however, do not demand the extreme accuracy which makes watch manufacturing so extremely trying.

It may be proper at this point to speak of one feature of watch manufacturing which might seem to show incompleteness in the "system." For many years the original American watch company manufactured watch cases as well as movements. But as their watches grew in favor, new watch companies were created, and as those new companies did not attempt the making of complete watches, other factories were organized for the exclusive manufacture of watch cases. As movement making has increased, case factories have also been multiplied

to an extent hardly warranted by the production of movements. All case factories, however, of necessity conform to the standards of measurement furnished by the movement makers, and those standards are so practically uniform that regular cases of all makers will fit corresponding movements produced by any of the regular watch companies.

This systematic method of manufacturing to standard dimensions is of exceeding importance to watch dealers, and the purchasing public also, as the customer is thereby enabled to select a watch movement of any desired size or grade, and also to select from a variety of cases one of such style or weight as best suits his taste. The ability to make independent selections of movement and case is one of the advantages of modern watchmaking made possible by the American system.

The use of automatic machines was applied to the manufacture of the smaller portions of the watch much earlier than to the production of the plates, as above described, indeed, it may be said that some of the earliest machines employed were semi-automatic. But so radical have been the changes and improvements instituted within the last 15, and especially during the last eight years, that methods previously used can hardly be considered as modern watchmaking.

One of the most interesting of those which are strictly modern is one for the turning of the delicate arbor on which is mounted the most swiftly moving wheel of the entire watch, the "balance." The fact that this wheel moves with such rapidity, together with the fact of its location at the farthest point from the reservoir of power, in the mainspring, makes it absolutely essential that it should be subject to the least possible amount of running friction. Consequently the pivots of this "balance staff" are exceedingly minute. It is of course an absolute necessity that every portion of the staff, including the delicate pivots, should run absolutely true. Exact truth was a difficult attainment under the methods ordinarily used, although great care was used to avoid any stress or distortion of the staff, by a very gradual reduction of the blank, so that 10 to 14 separate turnings were required to complete a staff. By the most approved modern methods and machines, all of the required turnings, including the pivots, are performed before the completed staff is severed from the rod of wire from which it is made. So complete is the machine, and so accurate and rapid is its operation, that a staff is delivered from the machine each 90 seconds.

The pinions of various sizes, which compose so large a portion of the time train of the watch, are formed from the best quality of steel rods, and, as this wire must of course have a diameter as great as the largest part of the pinion, it follows that a large proportion of the material must be removed to bring the pinion to its finish dimensions. An early method consisted in first cutting the wire into blanks of sufficient length, then to insert those blanks in a suitable chuck in the running spindle of a lathe, and with a suitable tool to remove the metal from the projecting end so as to bring it to an accurate point or centre. The blank was then reversed in the chuck and the opposite end pointed in like manner. In some instances a

WATCHMAKING

portion of the excess metal was removed in connection with the operation of pointing.

Following this somewhat crude method of pointing and initial turning, came the invention and adoption of so-called "roughing out machines," in which a rod of wire is inserted in the machine which automatically cuts off, points and turns the blanks on both ends and delivers them uniform in dimensions and requiring only the slight finish turnings and the cutting of the teeth when they will be ready for hardening and tempering.

A later form of machine has been devised, which takes a rod of wire at one end and delivers the pieces "finish turned" at the other end.

The finished blanks are then placed in a magazine or "feeder" in a cutting machine which automatically takes them one at a time and forms the teeth of the required number and shape, the work of the attendant being to keep the magazine supplied with blanks, and to examine the pinions occasionally in order to detect any imperfections, so that a single person can easily attend six cutting machines. For the greater convenience and comfort of the operator a chair is fitted to run on rollers on an iron track on the floor. These rolling chairs are also provided in connection with numerous other machines where a single person attends to a number of machines.

Within two or three years D. H. Church of the Waltham factory has created machines in which pinions are completely turned and the required teeth are cut. All the work being automatically performed, so that completed pinions are made, the last operation being to sever the finished pinion from the rod of wire from which it was formed. The exactness with which these machines operate makes possible the production of pinions which could not have been produced with tools and machines in previous use.

The limits of this article preclude more than the brief mention of a few of the features which are peculiar to modern watchmaking. Only one additional class of machines will therefore be mentioned. As each watch movement requires from 30 to 35 screws it will be evident that for a daily product of more than 2,500 watches more than 100,000 screws would be required. By the earlier methods employed in American watch factories an active man could make from 800 to 1,200 screws per day so that more than 80 men would be required for the production of this large number. But within a few years screw-making machines have been devised which are capable of making from 4,000 to 10,000 screws each per day, and being entirely automatic in action, a single attendant is able to attend six or more machines.

The almost absolute uniformity in the operation of the most improved modern watch-making machinery insures a resulting product so uniform in quality and dimensions as to make needless the minute "fitting" operations which are indispensable in work produced by even the earlier American methods. So accurately is the work performed that many of the most delicate portions of the watch, whose exact performance is absolutely essential, do not come together until all the finished parts meet for the final assembling.

It may appear strange, but it is nevertheless a fact that, by modern methods, watches

are not made by watchmakers, as that term is generally understood, but by machines. But when the numerous portions of the mechanism are made and assembled, the work of the skillful watchmaker begins; for he it is who by means of the skill and judgment, which come from experience, is able to discover the individualities and peccadilloes of each movement, and so remove any crankiness that its performance shall be satisfactory. In the better grades of movements there may also be required certain manipulations to "adjust" the watch so that errors of position and temperature may be compensated for.

It has already been said that the manufacture of watches by modern, that is, by American methods, is a very complex business, involving the employment of large capital and demanding the highest executive and mechanical talent.

For lack of some or all of these prime requisites a large number of watch factories in America have met with fatal disasters. But notwithstanding the multitude of such failures, and the further fact that not until after years of struggle and financial loss did any of the now existing watch factories receive any profitable returns whatever, there yet seems to be a peculiar fascination in the idea of watchmaking, so that new factories are still being organized. The wonderful business prosperity of the past few years in the United States has created a demand for watches which the more advanced factories could not possibly meet, and has given an opportunity for the smaller and poorer equipped factories to profitably market their relatively small product. It is gratifying to the pioneers of the American system to find that the superiority of machine-made watches is being recognized throughout the world.

The enormous growth of the railroad business in the United States and the greatly increased speed at which trains are now run has made absolutely necessary a standard of time and a high degree of accuracy in the running of all time pieces which are in any way connected with the running of trains. These new and exacting requirements are met by a few high grade watches with special adjustments to position as well as temperature. The natural effect of the requirements of the railroad time service has been to establish a higher standard of accuracy in rate for watches for the general public, and as there can be no arbitrary standard for comparison, or for reference, the ultimate and the absolute standard is found in the movement of the stars.

Very properly the United States government, by means of its astronomical equipment, at its naval observatory in Washington, is able to conduct the required stellar observations, and through the agency of the Western Union Telegraph Company distribute accurate time signals throughout the entire country. Previous to the establishment of this government system of time service, the American Waltham Watch Company had established an observatory with a complete equipment of instruments for observing and recording the stellar movements by which to compare its watches. This equipment consists of a fine transit instrument and recording chronograph made to order by the famous firm of Alvin Clark & Sons, together with two fine mean time clocks having gravity

WATCHUNG MOUNTAINS—WATER

escapements, made in the American Waltham Watch Company's factory, and in addition to these, another clock regulated to sidereal time. From one of the mean time clocks time signals are constantly transmitted to all parts of the factory. This feature of providing accurate timing standards is peculiar to modern watch manufacturing, and so far as is known no watch factory in the Old World is equipped in this manner. But, on the other hand, the Royal Observatory at Kew, England, and the Government Observatory at Neuchâtel, Switzerland, undertake the testing of the limited numbers of watches submitted by the manufacturers of those two countries.

In conclusion, it may be said that notwithstanding the two or more centuries of priority and experience enjoyed by European watch-makers, their extreme conservatism has allowed them to be outstripped by the more progressive manufacturers of America, so that modern watchmaking is at the present time, and in its most advanced form, an exclusively American achievement.

E. A. MARSH,
General Superintendent American Waltham Watch Company.

Watchung, or Orange, Mountains, in New Jersey; a range of hills west of Paterson, Plainfield, and Orange, extending north and south, but curving westward at each end. Length, about 40 miles. There are three divisions of the range, each composed of trap-rock, which was a lava flow about the time other portions of New Jersey were in a more advanced stage of formation. The mud and sand covering followed, and now the ranges are mostly shale and sandstone. The trap-rock, in places, forms elevations from 300 to 400 feet high, the soft sedimentary beds once enclosing it, yielded more rapidly to erosion. There is a similarity in the material composition of the Watchung Mountains and the Palisades, the difference being more in the direction of the original lava flow. The Palisades sheet was not a surface flow, but was forced between the sedimentary beds.

Water, a universally diffused liquid, the true nature of which was not discovered till toward the close of the 18th century. In 1781 Cavendish carried out a series of experiments by detonating mixtures of common air and hydrogen, or dephlogisticated air, as it was termed. He showed that by regulating the relative quantities "almost the whole of the inflammable and dephlogisticated air is converted into pure water." Although Cavendish showed experimentally that water is produced by bringing together oxygen and hydrogen, yet to Lavoisier, who received information regarding Cavendish's experiments, must be assigned the merit of interpreting aright the experimental results, and of proving that water was a compound substance—a compound of hydrogen and of oxygen.

Water may be produced by exploding a mixture of two volumes of hydrogen with one volume of oxygen; by passing hydrogen over many heated metallic oxides; and in various other ways. It exists, although never in a perfectly pure state, in immense quantities in nature. The composition of water has been determined by two distinct methods: (1) by volumetric synthesis; (2) by gravimetric synthesis. In volumetric synthesis of water measured volumes

of pure dry hydrogen and of pure dry oxygen are mixed, and the mixture is exploded by the electric spark while standing over mercury; the residual volume of gas is then measured; it is found that two volumes of hydrogen invariably unite with one volume of oxygen. In the second method a weighed quantity of a metallic oxide (usually cupric oxide) is decomposed by means of pure dry hydrogen at a high temperature, and the water which is produced is weighed. The decrease in weight of the oxide gives the quantity of oxygen in the water formed, while the difference between the total weight of water and the weight of the oxygen gives the weight of hydrogen used. It is found that 16 parts by weight of oxygen are always united with two parts by weight of hydrogen to form 18 parts by weight of water. As 16 is taken to be the atomic weight of oxygen the formula of water is H_2O .

Water is a colorless, tasteless, inodorous liquid. At all temperatures below $0^{\circ}C$, it is a solid, and at all temperatures above $100^{\circ}C$, it is a gas. When water at 0° is heated it contracts until it reaches the temperature of $4^{\circ}C$, after which it expands; conversely, when water at 100° is cooled it contracts until it reaches the temperature of $4^{\circ}C$, after which it expands; $4^{\circ}C$ ($=39.2^{\circ}F$) is called the point of maximum density of water; the specific gravity of water is greater at this than at any other temperature. The fact that water expands on cooling from 4° to 0° is a most important one. If a sheet of fresh water be cooled, the upper layers become more and more dense; they therefore tend to sink, and so fresh surfaces are exposed to the cooling influences. But when the temperature of the mass of water has reached 4° and further cooling of the surface causes an expansion of the upper layers, which continues until these become ice; these layers of cold water consequently float upon the warmer water underneath; hence it is impossible for the mass of water to suddenly freeze throughout. When water passes from the liquid to the solid state it expands to the amount of about 1-11th of its volume. This expansion is sufficient to bring about a large quantity of mechanical work; and to it the bursting of water-pipes during frost is to be largely traced. When solid water becomes liquid, or when liquid water becomes gaseous, a considerable quantity of heat is rendered "latent." Steam issuing from boiling water is no hotter than the water itself; water formed when ice is melting is no hotter than the ice itself; yet heat is being communicated to the ice and to the water. The latent heat of water is 79 thermal units; the latent heat of steam is 536 thermal units. In other words, in order to convert unit weight of ice at 0° into water at 0° a quantity of heat must be communicated to the ice, which, if communicated to unit weight of water at 0° , would raise its temperature to $79^{\circ}C$. In order to convert unit weight of water at 100° into steam at 100° such a quantity of heat must be communicated to the water as would suffice to raise the temperature of that weight of water through $536^{\circ}C$, or 536 times that weight of water through $1^{\circ}C$. Before water can become steam the upward pressure of its vapor must overcome the downward pressure of the atmosphere; hence it follows that the boiling point of water is conditioned by the atmospheric pressure. Water boils at a much lower tem-

WATER

perature on mountain tops, where the pressure is comparatively small, than in the valleys.

The solvent power of water is very large. As a rule hot water dissolves larger quantities of solid matter than cold. As has been mentioned water is never found in nature in a state of purity. The different kinds of natural waters may be divided into three groups: (1) Rain water; (2) river water; (3) spring, including mineral water and sea water.

Rain water, when collected before it touches the earth, contains only such impurities as may be derived from the atmosphere, chiefly consisting of oxygen, nitrogen, and carbon dioxide. The rain water of towns contains comparatively large quantities of acids and of soluble salts. The amount of these substances may be taken as an estimate of the comparative purities of the atmospheres of different towns. Rain water collected near the sea is rich in chlorides.

River water varies greatly in so far as the nature and quantity of the substances held in solution by it are concerned. The soluble constituents of river water are chiefly such as may be derived from the rocks through which the water of the springs which have fed the river has percolated. The dilution of the original spring water by the continual influx of tributaries reduces the relative quantity of solid matter held in solution, while the escape of carbon dioxide during the exposure of the surface water to the air causes the precipitation of those salts which were held in solution by the aid of the carbonic acid. River water is often largely contaminated by the drainage of towns or of manufacturing factories situated on the river banks.

Spring Waters.—The soluble constituents of spring waters are very various. In some springs the quantity of dissolved solid matter is but trifling, while in others it amounts to 2,000 grains per gallon. Spring waters are usually divided into classes in accordance as one or other dissolved constituent predominates. See **MIXED WATER**.

Sea water is essentially an alkaline chlorinated water. The quantity of solid matter held in solution varies in the waters of different seas. Inland seas, as a rule, contain less solid matter than the ocean; thus the solid content of the water of the Black Sea amounts to about 1,760 parts per million, while that of the Baltic averages 17,700, and that of the Atlantic Ocean 36,000 parts per million. The constituents of sea water are chiefly chlorides and sulphates of sodium, magnesium, and potassium, together with bromides and carbonates, chiefly of potassium and calcium.

Use of Water.—In considering the suitability of a water for domestic use attention should be principally paid to (1) the source of the supply, (2) the total solid matter held in solution by the water, (3) the organic matter held in solution, and (4) the action which is likely to be exercised on the water by the means of supply. Let us consider these points briefly. In examining the source of a water supply attention should be especially paid to the proximity of drains or sewers of any description, and to the likelihood of contamination from these sources. The nature of the soil through which the water percolates should also be inquired into. The solid substances held in solution by a sample of water may be estimated by evaporating a measured quantity of the water to dryness in a platinum

basin heated by steam, and weighing the residue. From a knowledge of the total solids in a water, unaccompanied by any further information, no reliable conclusion as to the suitability of such a water for potable purposes can be deduced. In seeking to determine whether a sample of water has undergone contamination with hurtful organic matter the following points are to be more particularly attended to: (1) Estimation of the amount of chlorine, whether existing as hydrochloric acid or as a chloride; (2) estimation of ammonia; (3) estimation of nitrates, and (4) detection, and estimation, if necessary, of poisonous metals. The presence of an undue amount of chlorine generally points to contamination with animal matter. Pure waters do not as a rule contain more than three to four grains of chlorine per gallon. It must, however, be borne in mind that such waters as flow through a soil rich in chlorides—such, for instance, as the waters found in the neighborhood of the Cheshire salt-beds—always contain large quantities of chlorine. The sudden appearance of chlorides in a water previously free or nearly free from these substances points to animal contamination.

Ammonia may be obtained from most waters by distillation after the addition of a little sodium carbonate; when the whole of this ammonia has been driven off it not unfrequently happens that the addition of an alkaline solution of permanganate of potassium and heating results in the production of a further quantity of ammonia. The ammonia obtained by the first distillation is usually spoken of as "free ammonia," while that obtained by the second distillation the name of "albumenoid ammonia" is given. The presence of even small quantities of albumenoid ammonia points unmistakably to organic contamination. Such ammonia is derived from the decomposition, by the agency of the alkaline permanganate liquid, of nitrogenous matter of animal or vegetable origin. Pure water should not contain more than 0.50 parts of "free" ammonia per million, nor more than 0.08 parts of "albumenoid" per million.

If nitrogenous matter has become thoroughly oxidized it gives rise to the formation of nitric and nitrous acids. The presence of these acids or of their salts, therefore, generally points to previous contamination of some organic nature. As, however, these things are the harmless—that is, in the quantities in which they occur in waters—products of the decomposition, and therefore of the removal, of hurtful substances, their presence, even when in comparatively large quantities, ought not of itself to condemn a water. The poisonous metals which are most likely to occur in drinking waters are lead and copper. These may be easily detected and estimated even when present in exceedingly minute quantities. For details of the analytical methods of water analysis reference must be made to manuals of applied chemistry. It is evident that in a water analysis we look for symptoms of a disease; not for substances which are in themselves hurtful, but for substances whose presence is associated more or less invariably with others, the action of which upon the system cannot but be most pernicious.

In storing water for domestic purposes the water may undergo contamination from the vessels containing it or from proximity to drains or other places emitting noxious gases. It is

WATER

certain that water exercises a solvent action upon lead; but our ordinary leaden water cisterns become coated with a comparatively insoluble compound of lead, so that the danger of contamination from this source is not great. Hot water should never be stored in leaden cisterns; it very quickly corrodes and dissolves the metal. Aerated waters act rapidly on lead; for this reason they should never be prepared in leaden vessels. The solvent action of water on copper is very small. The system of storing water for drinking or cooking in cisterns close to, or even communicating with, the house drainage system, is a very bad one. (See *SANITARY SCIENCE AND PUBLIC HEALTH*.) In some circumstances, as in the case of swimming-baths, large quantities of water have to be heated to a certain temperature and kept at the same for a considerable time while the water has to be maintained in a due condition of purity.

Water, Its Relation to Disease. Water is a necessary element for the maintenance of the life of both plants and animals. It is technically a food and is as necessary as food. It serves as a diluent and as a solvent and as a necessary ingredient of the plasma of the cells, maintaining the cell turgor and influencing partly by its chemical, partly by its physical properties, the osmotic tensions in the cells necessary to their healthful functioning. For most individuals two to three pints of water a day are necessary; many need more, most people are healthier if they drink at least two quarts of water a day, in addition to the water of their food. Each and every individual in a community, however, makes use of a much larger amount of water than this. The domestic uses of water are numerous. Cooking, washing, bathing, etc., consume much. The care of streets, of stables, of animals, etc., requires it; in short, the amount needed per person in the population, instead of the two to three pints mentioned, for all purposes amounts, according to Parkes' original calculation, to at least 12 gallons per day. His is a very small allowance, judged by modern American standards. Twenty to 40 gallons per day per person is a better allowance, even 50 is not too much. Excess amounts are often wasted to the detriment of the health of the people. Towns and cities need a greater water supply per person than do villages and small communities. It is an interesting comment that in small towns in which a public water supply has been established, the amount of water at first used is within the economic limits; but in a few years, if the supply is unlimited, the inhabitants soon learn to waste more than they originally used. In large cities like New York, Chicago, or Philadelphia, it has been estimated that the supply is really extravagant, three to five times the maximum requirements, and yet the politicians are constantly building new reservoirs. For many domestic purposes it is necessary to use pure water. Sea water may be used for street cleansing purposes, for fire engines, and many manufacturing purposes. Whereas for special reasons a dual system of water supply may be necessary it has been found better and cheaper to have one good supply and watch it carefully for its purity. Pure water, is really almost an impossibility. Pure and impure are only relative terms. A pure water does not exist in nature—gaseous or solid ingredients are al-

ways in solution in even rain water. All natural waters are therefore somewhat impure, but by usage a water is called pure when it contains nothing injurious to health. In order to arrive at some conclusions regarding the purity or impurity of water, and their relations to health and disease a brief glance at the sources of a water supply are necessary. Most of the water comes from the ocean. At least three fourths of the entire earth's surface is covered with water. The evaporation from the surface of the ocean is the original source of the inland waters. The winds blowing the moisture collect it according to well known meteorological laws and ultimately this same moisture falls as rain, the purest form of water in nature. It contains a certain amount of dissolved gases, nitrogen, carbonic acid, some sulphur, etc., with suspended matters from the air, the rain falling earliest in the shower, particularly after a drought, being very rich in the stuff from the air—dirt, soot, insect remnants, etc. As collected from the tops of houses, etc., such water is at first very filthy. Innumerable sources of contamination by the ordure of birds, dead insects, the dirty dust of the roads, etc., these are all washed down into the cistern. They may not be dangerous to health, but such water is not inviting to the imagination at least. Certain cities have to depend entirely upon such collections for their supply. Special devices for the cleansing and protection of these water supplies are in vogue. Lead containers are to be avoided for such water supplies. Rain falling in semi-rocky and mountainous regions usually gives the best kind of a water supply. There is enough foliage and open rock and stone to well aerate and filter such waters, and forming lakes or springs as they do, such make ideal sources for a water supply. In many regions, particularly in some parts of England and Scotland, peat abounds in such regions, giving a distinct brownish and peaty character to the water supply. The water is perfectly good, but has a much more acid reaction than most natural waters. This renders it an unsafe water to be conveyed in lead pipes as it dissolves this metal readily and causes lead poisoning. Much water falls upon gravel or dirt and collects some 20 to 50 feet below the surface—constituting a subsoil water supply. Most wells use such subsoil waters. These waters in themselves are not necessarily bad, but they readily become so by reason of pollution of the soil by privies, etc., often too near the well. This polluted matter is slowly carried to the water supply and frequently results in the spread of typhoid fever. If one patient should have the disease it might go through a whole township because of one infected well. River waters are usually mixtures of spring waters, surface waters and subsoil waters. Where there is little or no pollution because of no inhabitants in a region, such waters, if clear, are usable, but river waters need constant watching to prevent contamination. Water from deep driven wells is usually very pure. It may be impregnated with salts of various kinds making it unpleasant, but such waters are usually free from the germs of infectious diseases.

The disorders, diseases, etc., that may result from waters may be grouped into two main classes: those causing disease or disorder because of certain chemical constituents in or properties of the water—chemical salts, etc.,

WATER ALDERS—WATER-BEETLES

and those diseases due to infectious micro-organisms, animal or vegetable, which may be in the water used. In the first category there may be included goitre, lead poisoning, zinc poisoning, chronic constipation and diarrhoea. In the second various intestinal parasitic diseases, typhoid fever, cholera, dysenterics, diarrhoeas, etc. The evidence bearing on the relation of goitre to certain chemical constituents in the water supply is not conclusive. The famous case of Bozel reported on by a French commission is of importance. In Bozel in 1848 there was a population of 1,472, of whom 900 had goitres. Saint Bon, a neighboring village, had not a single patient with the disease. The water supplies were different. The Saint Bon water supply was then carried to Bozel and in 1864 there were only 39 persons in Bozel afflicted with the disease. A magnesium limestone formation was the most important factor in the water of Bozel. This was absent in the Saint Bon region. Other investigators in India have thought that the goitre resulted from a parasite found in certain waters. The true status is not yet settled.

Lead poisoning is not infrequent. Many soft waters act on lead piping, particularly in newly fitted houses, and the small amount dissolved often results in the listlessness, anemia, constipation, colicky pains, and even paralysis at the wrists so characteristic of lead poisoning. Kidney disease, stillborn babies, and even insanities may result from such lead poisoning through a water supply. Zinc poisoning has been known, but it is a curiosity. Chronic constipation is very frequently the result of drinking waters impregnated with iron salts and from drinking very hard water, while very soft waters and waters in which there are traces of sulphuretted hydrogen often cause excessive diarrhoea.

The most important water-borne disease, however, is typhoid fever (q.v.). In this, as is well known, the disease is an infectious one. The micro-organism causing the disease, the *Bacillus typhosus*, has found its way into the water supply and from there into the patient's body. It may have come from the drinking water, very frequently from milk, the cans containing which have been rinsed out in infected water; the ice may have been the water infected. Water infection is not the only source of typhoid fever spreading. It is an important one, however, and is the most conspicuous in certain epidemics, but as a rule direct contagion, from person to person, is the most important element in the spread of this disease. Of the means to avoid the spread of this disease, and the modes of contagion, consult *TYPHOID FEVER*. No patient ever gets typhoid from anything else except typhoid. It does not come "of itself." Cholera is undoubtedly a water-borne disease. Numerous practical experiences have demonstrated this—recent epidemics at Hamburg and Altona in Germany having given conclusive testimony. "Drink boiled water" is the watchword in infected cholera or typhoid regions. Everything coming in contact with the alimentary canal should be cooked.

Various parasitic bacteria may cause dysenteric and diarrhoeal disorders. Most instances of epidemic dysentery are examples of water infection. In armies most frequently contact infections, the *Bacillus dysenteriae* of Shiga, is known to be an important micro-organism in the

spread of epidemic dysentery. The most important of the parasitic worms that may be conveyed through drinking water are the round worm and the pin worm, but there are a number of rare parasitic worms thus conveyed. The eggs of both the round worm and pin worm are frequently found in drinking water derived from the subsoil and surface, and even more commonly communicated in vegetables such as lettuce, beet tops, etc., which are not thoroughly washed. Manured garden fields are the prolific sources of the eggs. Other intestinal parasites are guinea worms, whip worms and hook worms, *Filaria sanguinis*, *Bilharzia hematobia* and *Rhabdonema intestinale* are other rarer worms. See *DYSENTERY*; *TYPHOID*; *CHOLERA*; *PARASITES, INTESTINAL*. Consult Harrington, 'Practical Hygiene'; 'Encyclopedia Medica,' article on 'Water.'

Water and White Alders. See *CLETHRA*.

Water Balance, an oscillating pendulous frame, having a series of troughs in vertical series and inclined in alternate directions, so that, as the frame oscillates, the water dipped by the lower one shall be poured into the next above, which, on the return motion, shall pour it into the next, and so on.

Water Barometer. See *BAROMETER*.

Water-bears. See *TARDIGRADA*.

Water Bed, a contrivance for relieving any partial pressure of the body of a patient long confined to bed, and so preventing the formation of ulcers which arise from such local pressure. These beds are of various kinds. One form is that of a trough half-filled with water, covered by a loose lining of india-rubber sheeting attached all around to the upper edge of the trough so as to be watertight, a mattress being laid between the invalid and the lining. Another form is that of a large waterproof bag which is laid upon an ordinary mattress and half-filled with water, the weight of the body resting upon this directly or with bed clothes between.

Water-beetles, the numerous species of beetles which inhabit water. A common mode of life does not indicate blood relationship, and the various aquatic beetles belong to a number of quite distinct families. Besides those which are aquatic throughout their lives quite a large number of beetles live in or near the water only during the larval period. The strictly and permanently aquatic beetles belong chiefly to three families. The diving beetles (*Dytiscidae*) are predaceous throughout life and represent in the water the *Carabidae*, to which they are somewhat closely related, on land. The legs in these insects are adapted for swimming, the two hinder pairs being flattened and fringed with hairs. The body is oval and flattened. The mandibles are short and strong, and the thorax is broad. The front legs are short and the antennae long and filiform. In the genus *Dytiscus* the tarsi of the males are wide, flat, and provided with sucking disks, while those of the females are unmodified. Moreover, the females are of two forms, the one having the wing-covers smooth, the other grooved. The head is short, and received into the thorax. *D. fasciventris* is the common water-beetle of our

WATER-BOA—WATER COLOR PAINTING

ponds. These insects carry a supply of air for breathing beneath the *elytra* or wing-covers. At evening they fly in the air. They are eminently carnivorous in habits, and feed on other insects. The larvæ are active creatures, and are also aquatic; their noteworthy rapacity has gained for them the name of water-tigers, which they well merit, for they will not hesitate to seize in their sharp sickle-like jaws any insect-larva, small fish, or tadpole that comes within reach, and after draining its juices discard the dead body. The tail is terminated by a pair of respiratory tubes which are raised above the surface of the water to effect respiration. Besides this large species the family includes numerous small ones having similar habits. The other two families have club-shaped instead of filiform antennæ.

The *Gyrinidae*, or whirligig beetles, have the antennæ short, the front legs long, clawed, and in the males provided with a spongy disk, the second and third pairs of legs very short, broad, and paddle-shaped, and the *elytra* do not cover the tip of the oval body. They derive their familiar name from their peculiar habit of describing circles on the surface of the pools they inhabit. When alarmed these insects dive to the bottom and anchor themselves for a time by means of the strong front legs, carrying with them a small bubble of air on the tip of the abdomen. Owing to the smooth, polished, and oily surface they are unaffected by the water. The facets of the compound eyes are divided into two groups on each side, one adapted for vision in the water, and looking downward, the other for looking upward in the air—an important adaptation to the peculiar mode of life of these insects on the surface. When handled the whirligigs emit from the joints a peculiar strong-smelling milky fluid. Although, like the *Dytiscidae* larvæ, the young of the whirligigs are predaceous and their appearance is totally different; they are of slender form and, instead of a single pair of caudal respiratory tubes or gills, they bear 10 pairs of fringed lateral gills on the sides of as many abdominal segments. Several other genera and species are common in ponds.

The largest of the common water-beetles belong to the family *Hydrophilidae*, which, however, also includes numerous small and inconspicuous species. In the form of the body and the fringed oar-like middle and hind legs they resemble the *Dytiscidae*, from which all the members of this family are, however, at once distinguished by their short strongly-clubbed antennæ. The eggs are deposited in silken cocoons which are attached to water-plants or carried by the female. In general resembling the water-tigers in form, the larvæ have shorter, thicker, solid jaws, much less prominent respiratory tubes, and are much less active, although, like them, carnivorous. They pupate in burrows in the banks of the ponds which they inhabit. The great water-beetle (*Hydrophilus triangularis*) is a pitchy black polished beetle an inch and a half long, often seen flying at night, or during the day rising to the surface of clear weed-grown ponds for air and, unlike the *Dytiscidae*, usually resting head upward. In adult life they forsake the predaceous habits and animal diet of their larvæ and become scavengers, finding their food chiefly in the vegetable debris at the bottom of ponds. Few inhabitants of fresh-water ponds and ditches are better suited to life in an aqua-

rium than these beetles and few present a greater variety or more interesting habits.

Consult standard works, especially Miall, 'The Natural History of Aquatic Insects' (New York 1895). See FRESH-WATER INSECTS.

Water-boas, the anaconda snake. See BOA.

Water-boatman. See BOAT-FLY; WATER-BUG.

Water Brash. See PYROSIA.

Water-bug, an aquatic bug of the hemipterous family *Notonectidae*. The hind legs are long, and adapted for swimming by being provided with a fringe of stiff hairs. The body is prismatic in form, convex above and flat beneath, and the head is as large and as wide as the body. *Notonecta* is the typical genus of the family and *N. irritata* and *undulata* are two of the common species. These and others abound in ponds and streams, where they rest on their backs at the surface, occasionally striking out with a vigorous oar-like movement of the hind legs, or dive to the bottom and cling to plants or stones. They are constantly buoyed up by a film of air which surrounds the abdomen, partly entangled in a coat of close fine hairs, partly held between the wings and the abdomen in a space into which the spiracles open, and partly between the joints of the abdominal and thoracic segments. On land the water boatmen are at a disadvantage and progress by a series of spasmodic leaps; but they are agile fliers. As larvæ, nymphs, and imagoes they are predaceous and, besides strictly aquatic insects, young fishes, etc., they attack and suck the juices of flying insects which happen to fall into the water or approach its margin to drink. Various other hemipterous insects, such as the water scorpions (q.v.), are aquatic.

Water-clock. See CLEPSYRA.

Water Color Painting, in contradistinction to oil painting the use of water generally interfused with gum arabic as a vehicle for applying colors, very often transparently, to a white surface. Anciently, there were three distinct methods of water color painting, and these were known as tempera, encaustic and fresco. Tempera, or as it was sometimes called, Distemper painting, was common in early Italian art. (See PAINTING.) The colors were ground and mixed with the beaten-up white and yolk of an egg, or with the white juice of the fig tree, and sometimes with ox-gall. Encaustic painting (q.v.) was a process in which the colors were fixed by means of wax laid in a thin coating by the application of hot irons. The early Flemish and Dutch painters attained considerable success by the use of water colors in the shape of tempera, long previous to the invention of oil painting by the Van Eyck brothers. The Italian frescoes painted in water color, on damp plaster, have retained their colors scarcely impaired for centuries. (See FRESCO PAINTING.)

But when we speak of water color painting in a modern sense we refer rather to that which has been inaugurated since the discovery of oil painting and brought to great perfection by the modern schools of European painting. This style of water color painting has generally, almost universally, been executed on white paper. It is not too much to say that in England has been the first great field of water color painting. In the English school there has been

WATER COLOR PAINTING

no exclusive use made of what is known as body color. The lightness and darkness of each tint have generally been determined by the degree of their dilution with pure water, not by their modification through an admixture of Chinese white. Yet the old water color painters resorted to the pencil or the pen in finishing their drawings. They employed a great many varied kinds of paper; some of it was rough while sometimes it was perfectly smooth. In many cases tinted paper was used and the high lights picked out with Chinese white. In no case was a water color drawing begun before the paper had been stretched and sponged.

In early painting the pigments employed were generally mineral earths or juices pressed from plants. The colors found in antique frescoes were few but permanent in value. In the Middle Ages chemistry came to the aid of the fresco painter and supplied him with many brilliant and permanent tints, which in some instances vied with the lustre with which the church window maker annealed his glass. The modern water color painter has gained innumerable additions to the color gamut of his palette, and the freshness, crispness and unerring certainty of his touch have been largely due to the beauty, clearness and permanency of the colors in which he has worked. Manufacturers have, indeed, vied with each other in providing him with pigments which shall flow smoothly from his brush and stand projected with unclouded lustre upon his paper. While the modern water color painter aims at producing his effects by means of transparent washes in large and elaborate pictures, artists have not always considered it illegitimate to resort to the use of body color in their efforts to impart to their work the depth and solidity of oil painting.

The history of modern water color painting begins, as we have seen, in England, and the earliest precursor of the modern school was Francis Barlow (1626-1702). He painted birds and animals with appropriate landscapes, cleverly set in. In some ceilings which he decorated, birds were seen flying through the air; his drawing was spirited, but he was not a good colorist. Michael Angelo Rooker (1743-1801) was an early water color painter of landscapes and buildings and was principal scene painter at the Haymarket Theatre; he was a fine draughtsman and finished his work with such care and taste as give him a high place among early water color artists of England. This art was much advanced by Thomas Hearne, who used the pen much less freely than his predecessors, employing it with a delicacy which gave beauty of detail to the architecture and ruins which he generally chose as subjects of a pencil devoted entirely to water colors. William Payne (1760-1830) put this branch of art on a new footing, and first acquired that direct facility and dexterity of execution so requisite in the use of this vehicle; his works are also brilliant in color, and there is a breadth of treatment in sunlight effects, and in the contrast of warm tints and grays which established a precedent. John Robert Cozens (1753-1799) was the precursor of Girtin and Turner. His range of color was, indeed, narrow; he used Indian red, lake, indigo, yellow ochre, burnt sienna and black, yet Constable pronounced his works to be lovely, and he first taught the world

how atmosphere and sky can be rendered in a manner truly vivid and poetical, as the result of skilful handling. His pictures of Italian as well as of London scenery must be pronounced powerful. But, perhaps, Robert Girtin was the first to show the full power of this medium. He well-nigh entirely changed the practice of the art, and his pictures, which were made direct from nature, had a richness and depth of color, a clearness and transparency, which resulted from his method of first laying on in washes the fine local color of the objects before him, and then deepening the shadows with their own individual tints, as they shone before his eyes. His method was adopted by John Sell Cotman (1782-1842), whose landscapes and marines are some of the best productions of the Norwich School. Figure painting in water colors reached its first perfection in the works of Joshua Cristall (1767-1847), who was one of the foundation members of the Water Color Society. His early subjects were classical, but as he advanced in life he drew figures and scenes from country life, peasant girls, fishermen and landscapes, all executed in a direct, honest manner without the use of body-color or other doubtful expedient. More dramatic and sensational were the scenes of banditti, or of poetic romance, painted in water colors by Henry Liverseege—a worthy successor to Cristall in the simple and frank use of his vehicle, though his painting, in spite of powerful and brilliant coloring, was sometimes overstrained and coarse.

The full capacity of water color painting was not known before the pictures of Joseph Mallard William Turner (1775-1851), an early student of John Cozens's works, and a friend of Girtin, were exhibited to the world. His early water colors were, indeed, low in tone and gloomy, though forcible and convincing. What he came to do in the way of color is shown best in his Venetian studies, originally made on the spot in water colors. Turner, however, did not confine himself to the water wash; when he thought it necessary he employed body color in parts of his work, and even, on occasion, pastels; or it may be pencil or pen. But he never revealed to any one the secrets of a technique which made him the greatest landscape painter in water colors which the world has even seen. The foundation of the Old Water Color Society, in 1800, and of the New Society, in 1863, gave a great impulse to the art among whose representatives may be mentioned Fielding (d. 1855); Peter de Mint (d. 1849); Prout (d. 1852), the master of architectural painting; Cox (d. 1850), and the brilliant executor of oriental genre, Lewis (d. 1876). Taylor and Landseer, as animal painters, found this a successful and pliant medium, and among the Pre-Raphaelites who were eminent aquarellists may be mentioned Rossetti, Madox Brown, Burne-Jones, Holman Hunt and Millais.

In France, among able landscape painters in water colors, were conspicuous L. B. Labey (1767-1855); Hubert, J. Ouvrié, Sué and Fort. They pretty generally employed body color (*gouache*) in their composition, the transparent wash being much less frequently employed in France. In portraits, Olivier Grand; in flower painting and still life, Redonté (1759-1840), the

best painter of this class France has ever produced. But the art was not tried to its full capacity until the oriental sketches of Eugene Delacroix (1798-1863) proved to the French art world that there was something to be sought for fresher and more inspiring than the frigid classicism of David. His lead was followed by Descamps (1803-60), one of the best colorists and most original painters of the modern French school, who taught his countrymen that it was possible to represent in water colors the broad blaze of open sunlight in an African sand-plain; or in the streets of Smyrna and Constantinople. The powerful genres of Gavarini (1804-66) made a sensation even in England, the native home of water colors.

The German school of water color painting began with the illuminating or tinting by hand of copper plate engravings. An independent and distinct department of aquarelle came late in the history of German art. The first notable aquarellists in that country were Karl Werner of Leipsic, and Edward Hildebrandt of Berlin—Viermann, Otto, Graef of Berlin, Heindrich, Stöckles, R. Stieles of Munich, and a circle in Düsseldorf, including Scheuren and Mintrop, kept up the old traditions of German water color painting. A new path was struck out by Menzel, who obtained a great following. He adopted a broad, frank and dashing style which was much admired. The Berlin painters, such as Franz Skarbina and Paul Mayerheim, vied with him in this method of handling. But German aquarelle has never been distinguished for the lightness of touch, the brilliant and transparent coloring, the powerful and vivid landscape effects which we find in the productions of English and French artists. Italy and Russia on the other hand have many skilful practisers of this art. The vivid coloring of such masters as Corelli, Zezzola, and Mainella has a light and lustre all its own and the creations of these painters are worthy of comparison with many of the most eminent workers in their own department of art in other parts of Europe. The same may be said of the Russians, Benken-dorf, Bergholz, Karafin, Hefler, Jegornow, Pissemski, and Ehreoon.

Water color painting has always formed a very living section of American art life. When Vassili Verestchagin, the great Russian war painter, was in America, he was astonished, according to his own account, that native artists were not more alive to the possibilities of American scenery and American life as subjects for the pencil. He was not sufficiently acquainted with the history of art in the country to which he had come a stranger, to be aware of the fact that local art had long flourished there. The Hudson River School of painters produced many noble transcripts from the scenery of that river, mostly in large canvases, and by employing oil as a favorite medium, but several of them have also executed gems of art in water colors after the style of the best masters. Among those who have done some good water color sketching among the sublime scenery of the West may be named Albert Bierstadt, some of whose views are correct in drawing and rich in coloring, albeit they owed their original impressiveness to the novelty of the effects in atmosphere and mountain contour or coloring which they reproduced.

The same in a less degree may be said of the drawings of F. E. Church. Neither of these painters was, however, as triumphant in water as in oil. The New York Water Color Club has done much to foster a revived interest in this most difficult yet most effective and delightful department of the painter's art, and among the most successful of those who cultivate it may be enumerated, Abbey, Moran, Par-ton, Murphy, Parsons, Shurtleef, Tryon, etc. Louis C. Tiffany is a colorist of rare gifts, and although his natural predilection leads him to the representation of still life, yet his water color landscapes have a value of their own. Charles Sanderson is well known for his lovely water color studies of the shores of Lake Michigan. At the end of the 19th century there was suddenly a new movement developed in this department, principally through the influence of John H. Twachtman, whose early death was a sad blow to the cause he had most at heart in his native country. In 1898 the Ten American Artists crystallized into a new school of painting in New York. As far as this movement was represented by Twachtman it stood for a distinct advance in water color art. There can be no doubt that he reflected in the practice of his art the very best features of that style which in Europe was embodied in the work of Girtin, Cozens, and Turner. Water color painting in the United States numbers among its devotees many other great names. Homer D. Martin's few water colors are of the highest value. Frederic Crown-inshield shows in his water colors a noble sense of the form of hills and cliffs, and the greater forms of the landscape, as well as of tree-form. Winslow Homer's many water colors are about as important a contribution to American art as any other group of works. They are extremely vigorous and powerful, they sell at high prices, and among lovers of modern painting there are certainly none more esteemed. Winslow Homer is essentially a "painter's painter," and no single artist in the whole group is more admired by his fellow artists. John La Farge's water colors are what have chiefly made his great reputation. There are hundreds of them in private collections in Boston, New York, and neighboring towns, and the show of the South Sea Island collection, at the Paris Salon in 1898 or 1899, occupied a hall especially set aside for it, and made a great sensation. There is nothing in modern art more rich in color than these La Farge drawings, which have been produced during the years from 1865 to 1895, chiefly; for since that time he has been too much absorbed in decorating work, glass, and the like. The work of Robert F. Blum and that of Irving R. Wiles commands the admiration of their brother artists. Francis Hopkinson Smith is a master of loaded color, that which is mixed with white (the French *gouache*). There are women artists who excel in water color work of each kind.

Water-Gas, a mixture of gases produced by the action of steam on incandescent carbon. The carbon first decomposes the steam, forming hydrogen and carbon dioxide, and the latter gas then combines with more carbon to form the inflammable carbon monoxide. Thus water-gas is mainly a mixture of hydrogen and carbon monoxide. Pure water-gas is non-luminous, but it is rendered luminous by mixing with various gases obtained from petroleum, the luminous mixture being known as carburetted water-gas. Two chief methods are employed for the manufacture of water-gas for illuminating purposes. In the first of these, the Lowe process, the preparation of the pure gas and the carburetting are performed in one operation. The apparatus consists essentially of a generator, filled with anthracite or coke, in which the non-carburetted gas is produced; a carburetter, a circular chamber lined with firebrick and filled with a checker-work of the same material; and a superheater, a taller circular chamber similarly filled. By means of air-blasts and the producer-gas from the anthracite of the generator, the fire-bricks of the carburetter and the superheater are raised to a red heat, and then superheated steam is passed through the incandescent carbon. The water-gas formed passes over into the carburetter, where it becomes mixed with illuminant gases formed by the action of the heated bricks on mineral oil, which is introduced from above. This process is completed in the super heater, and the carburetted gas is then ready for purification. In the Wilkinson process the operations of making the gas and carburetting are separate. In the United States carburetted water-gas has largely replaced coal-gas as an illuminant, partly because of its brighter light and partly because it can be more cheaply manufactured in that country. Coal-gas is often mixed with carburetted water-gas in order to increase its illuminating power. The chief objection to the use of water-gas as an illuminant is the highly poisonous nature of one of its essential constituents, namely, carbon monoxide. Water-gas is also used in the non-carburetted condition as a fuel. See GAS.

Water Glass, a substance which, when solid, resembles glass, but is slowly soluble in boiling water, although it remains unaffected by ordinary atmospheric changes. It consists of soluble silicates of potash or soda, or a mixture of both. A substance of this kind was first discovered, so far as is known, by Van Helmont in 1640. In the 19th century Dr. Johann Fuchs of Munich did much to improve the mode of preparing and applying it. Water-glass may be prepared in two ways, called wet and dry. The former mode of preparation consists in breaking down and calcining flint nodules, the fragments or particles of which are then added to a solution of caustic potash or soda, whereupon the whole is exposed for a time to intense heat at 60 pounds pressure. According to the latter method the constituents are fused together in the solid state and afterward dissolved. The

product when prepared in this way is viscid, and may be used in this state or further diluted. In this method of manufacture the caustic soda or potash may be replaced by the carbonate or the sulphate. Potash water glass is more soluble than soda water glass, and if both metals be present a still more soluble glass, called double soluble glass, is obtained. Among the purposes to which water glass is applied are painting on glass, coating stone, wood, and other materials to render them waterproof, glazing scenery, and paintings, etc. It is also used mixed with sand to make an artificial stone, and it forms an ingredient in some kinds of cement. One of the most valuable of its applications is in the fixing of wall-paintings, which are more durable fixed by means of it than by the ordinary process of fresco-painting.

Water Hammer, the name applied to a vessel partly filled with water, exhausted of air and hermetically sealed. When reversed or shaken, the water, being unimpeded by air, strikes the sides with a sound like that of a metal striking against glass.

Water-hemlock, deadly poisonous plants (*Cicuta*) of the carrot family, known also by many other names, such as beaver-poison, spotted parsley, muskrat-weed and musquash-root, the latter names being borrowed from the muskrat, which inhabits such swamps as the *Cicuta* affects; and the odor of the roots of certain species of the latter also recalls the musk-scented rodent. *Cicuta maculata* is a tall biennial, reaching 8 feet in height, with a rigid, hollow stem marked with purple lines, that grows in swamps and wet lands throughout the northeastern United States. The leaves are decomposed, even three-pinnate, having coarsely serrate leaflets, with veins apparently ending in notches instead of at the points of the teeth, as in ordinary foliage. The flowers are very tiny and white, in decomposed, terminal umbels, with unequal pedicels. The fruits are ovate-oblong, glabrous, and slightly flattened laterally. The ribs are corky, the lateral ones being strongest. Spindle-shaped, tuberous roots cluster about the base of the stem, and are the cause of many deaths. They have an aromatic flavor, and fleshy substance, and are frequently mistaken, especially by children, for the roots of sweet-cicely, parsnips, artichokes, or even horse-radish, and are sometimes eaten for no particular reason except that they are fleshy and exposed by washouts, freezing, or digging-operations. Even live stock are killed, not only by feeding on the tubers themselves, but by drinking water poisoned by roots which have been crushed under the cattle's hoofs. The poisonous element in this *Cicuta* is an aromatic oily fluid, which permeates the whole plant, but is found chiefly in the roots, and probably contains the alkaloid conine, and the bitter principle cicutoxin. When eaten *Cicuta* produces vomiting, colic, staggering and unconsciousness, and finally, frightful convulsions which end in death. No chemical antidote being known, the only treatment possible is to cleanse thoroughly the digestive system, and treat each stage of the attack, with such medicines as seem necessary. Cattle may sometimes be saved by timely and repeated doses of melted lard. The western water-hemlock (*Cicuta verna*) has a fleshy root with a "vertical root-stock, from 1 to 6 inches long by 1 to 2 inches

WATER-HEN — WATER-LILY

thick, and is curiously divided into numerous chambers by horizontal partitions.⁹ The root is filled with tubes from which an aromatic oil exudes. Solid fleshy fibres are sent out from this rootstock, near the surface of the soil. Very small pieces of the rhizome are fatal to men or cattle, many of the latter being killed each year by it. The elongated, spindling-roots of the Wyoming water-hemlock, *Cicuta occidentalis*, which in Montana is known as the wild parsnip, has a characteristic musky odor, and stock are poisoned either by the young plants or by the roots. Other species of *Cicuta* have a similar appearance above ground and are equally poisonous.

Water-hen, or Moor-hen, a rail (*Gallinula chloropus*), generally distributed throughout Europe, Asia, and Africa. Its length is about 13 inches; back, wings, rump, and tail rich dark olive-brown; head, neck, breast, and sides dark slate gray; thighs and flanks streaked with white, belly and vent grayish white; beak yellowish, becoming red; naked patch on forehead red; legs and toes greenish-yellow, claws dark-brown. The female is rather larger and more vividly colored than the male. They frequent ponds covered with aquatic herbage, overgrown water-courses, and the banks of slow rivers, swimming and diving with facility, assisted by an expansion of the membrane along the sides of the toes. The water-hen is representative of the sub-family *Gallinulinae* of the rail family (*Rallidae*) which comprises 30 or 40 species found in all parts of the world. In the United States they are generally known as gallinules (q.v.) or mud-hens, and are represented by the purple gallinule (*Poronotus porphyrio*) and the Florida or common gallinule (*Gallinula galeata*).

Water-hickory. See HICKORY.

Water Inch, in hydraulics and irrigation, a measure of water equal to the quantity discharged in the 24 hours through a circular opening of one inch diameter leading from a reservoir under the least pressure, that is, when the water is only so high as to cover the orifice. This quantity is about 500 cubic feet.

Water-lily, a flower of the aquatic family *Nymphaeaceae*, especially of the genera *Castalia* and *Nymphaea*. These are found in fresh, still waters throughout the warm and temperate regions, and are often cultivated. Some can be easily raised from seed, and those which are hardy in the north, will stand a very low temperature without damage, even to be encased in ice. They may be grown in tanks, or even in half-barrels, as well as in ponds; but the tropical species, such as *Victoria regia*, require the warmth of a greenhouse, or heated tanks, in our northern latitudes. The water-lilies are handsome plants, having more or less orbicular, generally peltate leaves, either floating or, more rarely, immersed, and solitary flowers, of similar varying habit. These blossoms have several sepals and many petals, stamens, and carpels, the latter distinct, united, or immersed in a thickened receptacle; in color they may be white, pink, yellow, or blue, and are sometimes very fragrant. The fruit is indehiscent, somewhat fleshy, and like a giant berry filled with nuts, or, in the case of *Nelumbo*, the nuts are half sunk in pits in the flat-topped, enlarged

torus. The seeds are large with fleshy cotyledons and are naked, or enclosed in pulpy arils. Water-lilies, even in the time of Pliny, were considered to be an antidote to love-philtres. The most famous of them is perhaps the giant or royal lily, *Victoria regia* (q.v.). Another, which is very large, is the Australian water-lily (*Castalia [Nymphaea] gigantea*), which is one of the finest of its genus. Its flowers are sometimes a foot across, with hundreds of stamens, and the color is blue, or even other tints. They do not close so completely at night as do other water-lilies. The Egyptian lotus that was a favorite plant (*Castalia mystica*) of the ancient Egyptians is often confounded with the Indian lotus (*Nelumbo*), but is really a blue-flowered water-lily, formerly known as *Nymphaea lotus*. It was a valuable plant to the decorators of that country, who copied it, and conventionalized its form in many of their architectural ornaments, and also introduced it constantly into their painted pictures of life and customs. Its rootstock and seeds served as a food. (See LOTUS.) The European water-lily (*Castalia alba*) is similar, but has white flowers that are apt to open a little above the surface of the water, being supported on a stiff petiole. The flowers are not fragrant, as are those of the American pond-lily (*Castalia odorata*). The latter lovely lily rides upon the water, with creamy-white petals radiating in circles, the inner gradually narrowing, and passing by various stages into golden stamens in the centre. They expand in sunshine and close in the early afternoon. The fruit is ovate and baccate, and ripens under water. The leaves, or lily-pads, a favorite food of deer, are ovate-orbicular, with a deep sinus, and have very long tubular stems of unvarying thickness, great flexibility, and toughness. The thick, fleshy creeping rootstock furnished a brown dye for the early settlers, and was also used as a styptic and tonic. A variety of this lily is smaller, and has rose-colored flowers. There are several other species of *Castalia* in the United States, including the handsome golden-flowered lily (*C. flava*) of Florida.

One of the most common water-lilies is the yellow pond-lily (*Nymphaea*, or *Nuphar advena*) which blooms all through the summer, but is not very beautiful. The leaves are ovate, or orbicular, with a deep sinus at the cordate base. They may be either floating, or erect, especially when the plant grows in tidal streams, and is likely to be left standing nearly out of water, upon the ebbing of the tide. These pond-lilies also are known as spatter-docks and frequently join with pickerel-weeds in obstructing a boat's passage to the shore, along which they stand in an extended ribbon. The flowers are flattened globes, made up of half a dozen thick, golden sepals, arching over the stamen-like sepals. The fruit is ovoid, somewhat constricted at the neck, and contains edible seeds. The strong-growing Pacific-coast representative of the spatter-dock is the *Nymphaea polycephala*, known to the Klamath Indians as *wokas*. It is very like the eastern species. When fully mature, the large pods burst open irregularly at the base, and the entering water, when it reaches the white, mealy interior in which the seeds are imbedded, at once starts a mucilaginous dissolution of it, which frees the seeds, and allows them to sink into the water. These seeds were once a staple

WATER-LOCUST—WATER METERS

farinaceous food of the Klamath Indians, and are still a favorite delicacy among them. The squaws betake themselves in canoes to the lily-patches, and pluck the full-grown pods, while still hard, or scoop out those already dissolving with a wicker spoon. The latter are the more prized, and are deposited in holes in the ground, where the pods ferment, and turn into a mucilaginous mass from which the seeds may be freed by washing. Or the seeds may be extracted by other methods. They are then prepared in various ways for eating, either as mush or meal, or merely parched; they are delicious cooked in this manner.

Nelumbo nelumbo is the Indian lotus; *Nelumbo lutea* is the American or yellow lotus, of the Middle West. It is also called water-chinquapin, on account of its edible seeds.

Consult standard authorities, especially Bailey, 'Cyclopædia of Horticulture' (New York 1898).

Water-locust. See LOCUST TREE.

Water Mark. (1) The mark or limit of the rise of a flood or the mark indicating the rise and fall of the tide. (2) In paper-making, any distinguishing device or devices indelibly stamped in the substance of a sheet of paper while yet in a damp or pulpy condition. The water marks used by the earlier paper-makers have given names to several of the present standard sizes of paper, as pot, foolscap, crown, elephant, fan, post.

Water Meters, instruments by which the quantity of water or any other liquid flowing through pipes is measured and recorded automatically. They are of three general types—the "positive," the "inferential," and the "proportional" meters.

Positive meters measure the actual volume of the water, by the action of a piston working in a cylinder which is successively emptied and filled at the completion of each stroke. The cylinder being of known dimensions affords a measure of the quantity of water introduced in a given interval of time. The pistons are either reciprocating or rotary, or of the oscillating or gyrating disk patterns, and they may be single or double. When single, a weight or spring produces the return stroke, but in the case of the double arrangement, the reciprocal action of the two pistons is controlled by the action of each other, as in the case of a duplex pump. In rotary piston meters, which may also be of the single or double type, the pistons have interlocking faces and revolve in an air-tight chamber. Upon the outer surfaces of the pistons are a series of projections and recesses which correspond to similar shapes on the inner walls of the cylinder. The pressure of the flowing water causes the piston to revolve so that a series of recesses or chambers in the cylinder are successively filled and discharged from the inlet to the outlet of the meter. When oscillating or gyrating disks are employed in the place of pistons, the wobbling motion of the disks alternately empties and fills the cylinder. Inferential meters measure the velocity of the flowing water by recording the revolutions of a turbine or other water-wheel attachment, and the quantity is deduced by computation from that record. Proportional meters measure a fractional part of the full flow and are therefore capable of being set on a small by-pass pipe which

branches from and subsequently rejoins the main pipe, but their use is quite limited.

The registering mechanisms consist of a series of cog-wheels and dials. The flow of the water actuates the cog-wheels, and the number of revolutions are recorded on the dials. The arrangement of the mechanism converts the number of revolutions into any desired unit of volume, so that the reading of the dials is termed straight and gives the quantity direct, in cubic feet, the unit generally adopted, particularly in the United States.

The working parts of meters are made light and durable. Serviceability and accuracy are the qualities required, and in their design the support of the water pressure is employed to reduce to a minimum the loss of head, and the wear and tear of the working parts, and although a high degree of accuracy is not generally required, the meters are made sufficiently sensitive to measure the small flows incident to leakage. Hard rubber is generally used for the disks, and also for the rotary pistons of some meters, but where the liquids are hot, or consist of chemical solutions, brass is generally employed. Possible damage due to clogging by the introduction of fish or gravel, is prevented by various forms of strainers and sieves, while effect of frost is guarded against by frost cases.

There are several forms of meters which do not come under the general classes already described. Of these the "Venturi," constructed by Clemens Herschel of New York, in 1886, is the superior and most useful on account of its simplicity and durability. Its basic principles—the relation between the reduction of pressure and the increase of velocity of water flowing through a contracted pipe, was discovered by Venturi in 1796. In construction it consists of two conical shaped pipes with their smaller ends joined together by a collar or throat-piece, resulting in a shape similar to a pipe contracted at one point of its length. By gauging the pressure of the water at a point just before, and also directly at the point of contraction, and the relation of these pressures to the diameter of the pipe, the volume of the flow is computed. The tubes are usually constructed of cast iron or riveted steel, but they may also be constructed of masonry or wood. The length of the meter varies from 8 to 16 times the diameter of the uncontracted portion, while the diameter of the contraction ranges from one fourth to one half of the full diameter of the tube. They are made in sizes varying from 2 to 94½ inches, with practically no limit to the possible maximum size, but for practical use where meters of diameters less than six inches are required those with moving parts are cheaper. Waste-water meters are employed in connection with water works to measure the rate of consumption per unit of time, instead of the total volume. They consist usually of a disk placed horizontally in a cone-shaped chamber. The disk is lifted or lowered according to the greater or lesser volume of water passing through the pipe in which it is set, and being connected by a wire with a counter weight and pencil which follow the movements of the disk, records the nature and amount of those movements on a paper carried by a drum which is revolved by clockwork. The vertical rulings of the record sheet indicate the time intervals, while the horizontal lines

WATER-MOCCASIN—WATER MOTOR

represent the units of volume. Since all the water consumed in a given district must pass through such a meter, by comparing the rates of consumption of the various districts, the causes of abnormal waste are readily determined and localized.

Another form of water meters, more particularly known as current meters, are employed in hydraulic engineering to measure the velocity and volume of flow of the waters in rivers, large aqueducts, and sewers. See **CURRENT METERS**.

W. MORRY, JR.,
Consulting Civil Engineer.

Water-moccasin, a snake. See **MOCCASIN**.

Water Motor. In its broadest sense the term is applicable to all forms of machines or systems of machinery operated by water under the force of gravity, or in other words, by which the energy inherent in a natural waterfall is utilized to perform mechanical work. Of these machines, the water-wheel (q.v.), the turbine (q.v.) and the pump (q.v.), have been treated under their respective titles, but in this article the term will be considered as designating those machines which are operated by the element of pressure only, such as hydraulic lifts and water-pressure engines.

The Hydraulic Lift is the simplest of all water motors. The direct-acting lift consists of a cylinder in which a ram or piston of equal length, with a cage attached to its upper end, works up and down. The level of the water supply is necessarily above that of the maximum height to which the cage may be lifted, so that when the water is admitted to the cylinder through its lower end, the pressure forces the ram upward and thus lifts the cage. The descent of the ram is accomplished by closing the supply valve and opening the discharge valve, the ram descending by its own weight. As the weight of the ram is greater than necessary to bring down the cage, a part of that weight is balanced by a weight attached to the end of a chain that works over a pulley at the top of the lift and is connected to the cage. The most familiar examples are the high-speed hydraulic passenger elevators. They are operated by the pressure of water pumped into tanks situated on the roofs of the buildings in which they are installed, while the operating machinery is located in the basement. (See **ELEVATOR**.) The hydraulic press and the hydraulic ram are devices operated practically under similar principles. In the former, the action depends upon the principle of hydrostatics that a pressure applied to any part of the surface of a liquid is transmitted in all directions, and throughout the mass without diminution. For example, if a cylinder filled with water has a plunger one inch square working through one end, and another ten inches square working through the other end, and a pressure of one pound is exerted on the smaller plunger, this pressure will be transmitted to the larger plunger, and be delivered by the latter in a multiplied amount equal to the square of its face area expressed in pounds. In this example that pressure would be 100 pounds. Such presses consist essentially of two cylinders connected by piping. The pressure is applied to the plunger of the smaller cylinder, and the multiplied pressure is transmitted by that of the larger to the

object to be raised or pressed. In construction they vary greatly with the purposes for which they are employed. Those used as hay, cotton and oil presses, consist of four strong iron pillars arranged in the form of a square, which carry a cast-iron plate solidly attached to their tops. A similar casting is situated at the bottom of the pillars. Through a circular hole in the centre of the lower plate, a plunger carrying a square platen on its head, works with an upward motion and presses the material placed between the platen and the under face of the top plate. In presses used for hydraulic forging, the cylinder and plunger are carried by the top plate, while the bottom plate carries the anvil. The plungers work downward in the act of pressing or hammering. They are made of various sizes, and are generally provided with two pressure plungers and cylinders, and they are adapted for purposes varying from the manufacture of revolver cartridge cases to the forging of armor plate, guns, and steamship shafts. Armor plate presses capable of exerting a pressure of 14,000 tons are in use, while 7,000-ton fluid compressors are employed in many of the larger steel manufacturing plants. A brief description of the construction and working of one of the last-named capacity will serve to illustrate the mammoth proportions and enormous power of these machines. It consists of an upper head weighing 120 tons carrying the plunger, and a 135-ton base plate containing the hydraulic cylinder. These are supported and held in place by four vertical connecting columns each 50 feet long, and 19 inches in diameter. In operation, the molten metal is poured into a mold built up in sections, and the mold is raised under a hydraulic pressure of 7,000 tons, while a plunger attached to the upper head bears down upon the fluid metal and compresses it.

Hydraulic Ram.—In the hydraulic ram the force of water flowing by gravity is utilized to raise a portion of itself to a height above that of the source of supply. Two pipes are employed. The water in flowing through the main or drive pipe acquires sufficient momentum to close a valve at the foot of the pipe, and the water thus confined automatically opens another valve, partially fills an air chamber situated over the foot of the main pipe, and compresses the air in it until the pressure within balances the column of water in the main pipe. Then, the foot valve of the main pipe opens again and the action described is repeated. In the meantime, the pressure in the air chamber forces the water through a small service pipe leading out of its bottom, to the required height. See **HYDROSTATIC PRESS**, **HYDRAULIC RAM**, and **PUMPS AND PUMPING MACHINERY**.

Hydraulic Engines.—In the hydraulic lifts or elevators, the admission and discharge valves are worked by hand at the will of the operator, but in the engines the mechanism actuates the valves automatically and periodically, thus converting the lift into a machine with a continuous action. Unlike the vertical water wheels and turbines, the efficiency of which depends upon the weight of a large body of water falling from a comparatively small height, the water engines work under the pressure of a small column of water descending from a considerable elevation. They are of three types—the "single action," in which a piston working in a cylinder is moved upward by the pressure of the water,

WATER-MOLDS—WATER-POWER

and downward by the weight of the piston itself; the "double action," in which the cylinder is closed at the top as well as at the bottom, and the water admitted to it by supply pipes at those points, acts reciprocally on the piston from above and below; and the "rotary," in which the water pressure acts on a revolving piston similar to that of a rotary steam-engine. Rotary engines may be of the single-acting or double-acting type, the advantage being with the former, since the pressure of the piston is always exerted on the crank pin in one direction, and the dead centres are passed without knocking. Generally three single-acting cylinders formed in one casting are used in connection with a disk valve with segmental ports which pass over corresponding apertures in the valve seating during rotation, and the engine will readily start in all positions. The first engine of this kind was constructed by Sir William Armstrong, who also subsequently designed one of the reciprocating pattern. Since then a great variety of hydraulic engines have been invented, the greater number of them being of the last-named type. They have a wide field of usefulness, especially as auxiliary motors for driving small machinery such as hoists, swing-bridges, capstans, cranes, winches, etc. The employment of superheated water motors is one of the latest developments in the methods for railroad traction. In the earlier forms of engines operated by superheated water, the storage tank being charged with water at a temperature corresponding to several hundred pounds of pressure, the steam from the water was utilized in the cylinders of the motor in a manner similar to the utilization of steam from the boiler of a locomotive engine by expansion in its cylinders. Their operation was based upon the relation of temperature and pressure to the vaporization of liquids, and the steam was drawn off from its point of formation at the top of the storage tank to the cylinders. Under these conditions, new steam was supplied by water which boiled at lower and lower pressures and reduced temperatures, until the pressure fell to a point at which it was not available for use in the motor, and only about one ninth of the energy of the heated water was actually used in the cylinders. About 1888, W. E. Prall of Washington, D. C., suggested the utilization of the heat in the storage tank by withdrawing it in the form of water from the bottom of the tank instead of steam from the top, and allowing the water thus withdrawn to give up its heat within the cylinders of the engine itself. In the latest motors, this is accomplished by a generator composed of a nest of tubes coupled into manifolds at the top and bottom. The working pressure is about 700 pounds to the square inch, and the water is drawn off from the generator into three insulated storage tanks with a total capacity of 7,000 pounds, carried beneath the car. From the bottom of the tanks the water is delivered through three Tappet valves provided with screw and nut adjustment, to regulate the amount of feed. In operation, under the decreasing pressure caused by the movement of the piston through its stroke, the water resolves into steam in a continual series of flashes, while the steam and the unevaporated portion of the water from the high-pressure cylinders, pass out through the ports in its bottom, and is drained off through valves located in the lower face of

the valve chest. The exhaust steam from the high-pressure cylinder passes in the ordinary way to the low-pressure cylinder, from which it is finally exhausted, into the atmosphere. It is estimated, that a car equipped with two compound engines and three tanks charged with water at a pressure of 700 pounds to the square inch, and a corresponding temperature of 500°, will be capable of running 40 miles at a speed of from 30 to 40 miles an hour.

Water-plantain, an aquatic or marsh herb of the genus *Alisma*, family *Alismaceae*, of which *Sagittaria* (q.v.) is also a member. The plant most commonly known as water-plantain is that found also in Europe and Asia (*Alisma plantago aquatica*), which grows in mud or shallow water. It has a circle of radical long-petioled leaves, ribbed ovate, and strongly resembling those of the common plantain. The scape, which is usually solitary, branches verticillately, and forms a large, open pyramidal, flowering panicle; the blossoms are very small, white or rose-colored, and have their parts in threes.

Water-power, a term used popularly and by engineers to define the apparent inherent energy of a falling body of water. It more properly signifies the application of the force of gravity employed as a motive energy for industrial purposes through the medium of water. Next to wind-power, when available in a sufficient amount, it is the ideal form of motive energy, combining a constant supply with a minimum of cost. Water acts as a motive power either by its weight, or by its *vis viva*; in the latter case the action is either one of pressure or impact, and the energy thus exerted is made available for industrial purposes by three classes of machines—water wheels, turbines, and hydraulic pressure engines. See WATER WHEELS; TURBINES; WATER MOTORS.

When the power is derived from a fall, and utilized by means of water wheels, the potential energy is the product of the height through which the water falls into the weight of that water, and may be readily computed for any fall by multiplying the volume of the flow in cubic feet per minute by 62.5 (weight of 1 cubic foot of water in pounds), and this product by the vertical height in feet. The result will be the amount of power expressed in pounds, which when divided by 33,000 will give the horse-power. When a stream acts with an impinging force upon a solid surface, the pressure exerted is equal and opposite to that by which the velocity and direction of the stream is diverted. Neglecting the factor of friction between the fluid and the surface on which it moves, the effect of the machine is equal to v^2

— wX , in which X represents the volume in cubic feet, w , the weight of water in pounds, g , grav-

WATER-POWER

ity, and v , the velocity of the flow in feet per second. When the action is that of weight and *vis viva* combined, as in the case of water flowing in a tube, the horse-power or the mechanical

effect of the motor is equal to $(h + \frac{v^2}{2g}) \times \text{mil-}$
 $\text{liplied by } 62.5.$

As a basis for indemnity under confiscation and other adjudication proceedings, the value of a water-power is commonly estimated as represented by a sum of money, the interest on which would maintain a steam plant at that place, capable of producing an equal amount of power. The best authorities, however, consider the method as erroneous, and that the value of such a power really depends upon a great number of conditions, such as location, quantity of water, height of falls, uniformity of flow, expense of dams, canals and foundations, the character of the machinery installed, and the freight charges for fuel, raw materials and finished product. Making the proper allowances for these conditions, a comparative estimate on the basis of a 500 horse-power plant, gives the gross cost of a horse-power per steam plant as about \$22,000, and that of a water-power plant as about \$19,000, representing a saving of \$30,000 per 10,000 horse-power per annum by the use of the latter. Another estimate based upon the cost of steam on large compound engines generating 1,000 or more horse-power under a boiler pressure of 120 pounds, gives a cost per annum of \$20.00 per horse-power, against \$15.00 per horse-power, developed by a water-power electric plant, established at an original cost of \$100 per horse-power, and allowing for the wages of competent attendants for the dynamos.

For renting purposes a rate unit termed "mill-power" is employed. This unit, however, is quite arbitrary, and varies in different locations, even in the same States. At Holyoke, Mass., it is declared right to draw 38 cubic feet of water per second during 16 hours in a day where the head at the fall is 20 feet, or a quantity proportionate to the height at the falls, equal to 86 horse-power, as a maximum, while at Lawrence, Mass., it is right to draw during 16 hours in a day a quantity of water sufficient to give a power equal to that of 30 cubic feet per second with a head of 25 feet, equal to a maximum of 85 horse-power.

The natural sources of water-power are rivers and streams, but as the gradient or fall of a river is seldom more than sufficient to overcome the friction due to the gradual descent of its waters, the kinetic energy or energy of motion is made available for practical purposes by the employment of dams, canals and aqueducts. The use of dams may be illustrated by assuming the gradient of a stream to be 2 feet to 100 feet. By building a dam 12 feet high across the stream, the gradual slope of 12 feet over a distance of 600 feet is converted into a vertical interval of 12 feet, and the kinetic energy of the stream expended in friction over the gradual descent of 600 feet is accumulated at the top of the dam in the form of head or pressure. This energy is utilized by conducting the water flowing over the dam to the motors through which it passes into the tail race and re-joins the stream. Where conditions are unfavorable for the construction of a dam a part of the stream may be directed into a reservoir

at a point beyond that at which the power is required, sufficiently distant to give the necessary fall, and then conducted by a canal or aqueduct to the motor, as in the case where the power is obtained from a natural water-fall. Occasionally, where the velocity of a stream is sufficient to give the required power, it is used directly for working the motor.

Current motors, however, to be most effective, would require the backing up of the whole volume of a stream until the actual head was equivalent to the theoretical head developed by the natural velocity of the stream, and as but a fraction of this velocity can be taken up by such a motor, its efficiency is generally very small. They may be employed to obtain power in small amounts from large streams, but are impracticable for developing large powers.

From 1822 up to the present time (1904) over 35 water-power plants of great magnitude have been established in the United States, capable of developing in the aggregate over 300,000 horse-power per minute. The individual plants developing 10,000 horse-power, or more per minute, are those at Lowell, Mass., 11,845, with a head of 35 feet; Manchester, N. H., 12,000, head 54 feet; Lawrence, Mass., 11,000, head 30 feet; Holyoke, Mass., 14,000, head 50 feet; Lewiston, Maine, 11,900, head 55 feet; Columbus, Ga., 10,000, head 26 feet; Saint Anthony's Falls, Minn., 15,500, head 50 feet; Niagara, N. Y. (Hy. Canal), established in 1861, 15,000, head 95 feet; and tunnel, established in 1892, 50,000, head 176 feet; Turner Falls, Conn., 10,000, head 35 feet; Spokane, Wash., 18,000, head 72 feet; Great Falls, Mont., 16,000, head 40 feet; Austin, Tex., 10,000, head 68 feet; Sault Ste. Marie, Ont., 10,000, head 15 feet; and Helena, Mont., 10,000, head 38 feet.

At Niagara, Sault Ste. Marie, Ogden, Mechanicsville, and Great Falls the water-power is employed to operate turbines or water-wheels which in turn drive electric dynamos, and the electrical energy thus developed is transmitted to and utilized by the neighboring cities. The power that may be thus obtained from the falls at Niagara is practically unlimited, and after the turbines are installed entails no further expense; but the enormous cost of the conductors required to transmit the electric power to distant points prevents the establishment of additional plants to develop a greater voltage for that purpose, while that produced at the present time is actually much more than the cities in the immediate vicinity are capable of utilizing, under the existing low voltage regulations. As a matter of fact, although the possibility of transforming water-power into electrical energy which was capable of being transmitted to comparatively distant points was a great impetus to the development of water-power plants of great magnitude, a fair, not to say full, utilization of the almost incalculable amount of power going to waste at Niagara and elsewhere, is possible only through the discovery of a cheaper conductor of electricity than copper.

WATER PURIFICATION — WATER SOFTENING

Water Purification. See WATER SUPPLY; WATER-WORKS.

Water-rabbit, or Swamp-hare. See HARE.

Water-rail, a species of rail (*Rallus aquaticus*) widely distributed over Europe, Asia, and North Africa, and generally common, but, on account of its retiring habits and shyness, not often seen. It is about 11 inches long, olive brown above streaked with black, the under parts gray and the sides streaked. It frequents marshes and bogs, dives and swims well, but is a poor flyer. It is a delicious table-bird. In North America its nearest representative is the king rail (*R. elegans*). The name is applied generally to other species of aquatic rails (q.v.) in distinction from the land-rails and crakes (q.v.).

Water Rat, or Vole. See VOLE.

Water Rights. See RIVERS; RIPARIAN RIGHTS.

Water-scorpion, a bug of the family Nepidae, whose species inhabit ponds, and take their popular name from the scorpion-like form of the fore-legs, with which they seize their prey. The remaining two pairs are slender and locomotory, and the abdomen terminates in a long, slender breathing tube. Some of the species carry the eggs in a layer on the under side of the abdomen. *Belostomatidae* includes the largest species with flattened bodies and four-jointed antennae; *Nepa* is much flattened and oval, and the antennae are three-jointed and lamellate; while *Ranatra* includes species of linear form. The larvae and nymphs of the water-scorpions resemble the imagoes in general aspect, but lack the wings of the latter. In all stages they are sluggish in movements and secure their prey by hiding and stealth. These insects are very interesting in habits and structure. See FRESH-WATER INSECTS.

Water Shell. See ORDNANCE.

Water-snake, a harmless colubrine American snake (*Natrix fasciata*), closely allied to the garter-snakes (q.v.), but of aquatic habits, swimming and diving with great ease and skill, and spending its life largely in streams, ponds, and marshes. It lives largely upon fish, either alive or dead, frogs, tadpoles, newts, and aquatic insects and other small creatures. It is mottled in variable dull tints, and lively and pugnacious. Its eggs are laid in holes in stream banks and similar places. The common grass-snake (q.v.) of Europe, the only British serpent except the viper, is a near relative.

Water Softening, specifically the art of extracting from water the calcium (lime) and magnesium compounds which combine with soap and prevent the formation of lather, and thus are said to make the water hard; in general the extraction from water of any substance, lime, magnesia, acid, mud or other material which renders the water unsuitable for industrial use. Rain water contains only the soluble gases of the air, carbonic acid gas and oxygen, and such dust and dirt as it may have washed out of the air in its fall. Such water mixes readily with soap to form a slippery lather, and the water is said to be soft. If rain water runs down a clean, grassy slope to a stream, it is still nearly pure soft water. If it runs over limestone, or ground containing particles of limestone, it dissolves a

small amount, perhaps two grains per gallon or one part of limestone to 30,000 parts of water; but for practical purposes this is still called soft water. If, however, the rain water sinks into the ground to remain a long time in contact with limestone, it dissolves greater amounts, frequently 20 grains per gallon of water and sometimes more than 100 grains per gallon; and water is commonly said to be hard if it contains more than 5 grains per gallon. Deep well waters are nearly always of this nature. In the arid plains of the western part of the United States where the soil contains large quantities of common salt (chloride of sodium) and the other salts of sodium and potassium which are all readily soluble in water, the well waters are usually heavily charged not only with the salts of calcium and magnesium but also with the salts of sodium and potassium, and such water is called alkali water. The water which is found near the coal fields frequently contains sulphuric acid to the amount of 2 or 3 grains per gallon. Lakes contain the waters of many creeks and rivers and are usually soft water; but the current is slow and there is some concentration due to evaporation of the water, so that lake water contains rather more mineral matter than river water and is on the border line between soft and hard. Lake Erie water contains about 5 grains per gallon of the salts of calcium and magnesium. The oceans are the final receptacles for the waters of the rivers and lakes and are subject to continuous evaporation, so that in the course of years the mineral matter has become concentrated and ocean water contains about 2,100 grains per gallon of mineral matter, made up of calcium carbonate, 8 grains; calcium sulphate, 75 grains; magnesium sulphate, 99 grains; magnesium chloride, 230 grains; potassium sulphate, 55 grains; sodium chloride, 1,633 grains; the great amount of sodium chloride and the relative scarcity of calcium and magnesium compounds being due to reactions which have taken place in the water. Great Salt Lake in Utah and the Dead Sea in Palestine (q.v.) are small bodies of water, like oceans, without other known outlets than evaporation, and since the rivers feeding them are heavily charged with common salt, these lakes contain much more of it in proportion than the oceans. Ocean water contains about 3.5 per cent mineral matter, the Dead Sea 26 per cent, and Great Salt Lake averages about 20 per cent.

When hard waters are evaporated the mineral matter is left in a solid mass, interesting examples being found in the stalactites and stalagmites in caves, in the incrustation about the teeth in the human mouth, and in the deposit in the bottoms of tea kettles. The most serious damage produced by hard water in industrial operations is from the scale deposited in steam boilers and from the waste of soap in washing. Scale in boilers prevents the easy passage of heat from the fire to the water, and shortens the life of the boiler because of the excessive temperature to which the steel must be raised in order to force the heat through the scale to the water. The amount of extra fuel required to evaporate water in a boiler which is coated with scale varies with the thickness and character of the scale and with the rate at which the boiler is worked. When the boiler is being driven to nearly its full capacity, the amount of extra fuel required by a $\frac{1}{4}$ inch

WATER SPOUT—WATER SUPPLY

layer of scale is frequently as much as 30 per cent; but if the boiler is being worked at only half its capacity the difference may not be more than 10 per cent. Nearly all tables of such data are based on measurements of the additional amount of fuel required in a scale-covered boiler to heat the water at the same rate as in a clean boiler worked at normal capacity. It is estimated that the railroads of the United States are spending at least \$15,000,000 annually in additional fuel and boiler repairs due to the hard and muddy water used in some parts of the country. Using hard water in boilers is much more expensive than softening it, since on the average 1,000 gallons of hard water will do 50 cents worth of damage in fuel and repairs, while 1,000 gallons of hard water may almost always be softened for less than 5 cents. The value of the soap wasted by hard water is enormous, amounting to 70 cents per 1,000 gallons of water 10 grains hard when it would cost perhaps 8 cents per 1,000 gallons on the average to soften such water.

The chlorides and sulphates of calcium and magnesium are readily soluble in water, but the carbonate of lime or magnesium (marble or ordinary limestone) is soluble only in water which contains carbonic acid gas (CO_2). It is a simple matter to soften water which contains only the bi-carbonate of calcium, because it is necessary only to steal away the extra molecule of CO_2 by adding a little fresh caustic lime which has a great affinity for carbonic acid gas and combines with it to form a molecule of mono-carbonate of calcium, which is insoluble, and, like the remaining molecule of mono-carbonate, settles to the bottom as precipitate. The chemical reaction is stated thus:

Calcium	Slaked	Calcium mono-	
bi-carbonate	lime	carbonate	Water
$\text{CaCO}_3(\text{CO}_2)$	$+ \text{Ca}(\text{OH})_2$	$= 2\text{CaCO}_3$	$+ \text{H}_2\text{O}$

and thus there is precipitated to the bottom not only the original dissolved limestone but also the slaked lime which has become limestone by uniting with the molecule of carbonic acid gas which held the original limestone in solution. This discovery or invention was made in England by Dr. Clark about 1840, and no better or cheaper method has since been found for extracting carbonate of lime from water.

In the case of the sulphate of calcium no extraction in the above sense is possible, for we simply substitute sulphate of sodium for sulphate of calcium. The ordinary method of taking out sulphate or chloride of calcium is to add to the water the proper amount of sodium carbonate (soda ash or washing soda), when the sodium and calcium exchange acids as follows:

Calcium	Sodium	Calcium	Sodium
sulphate	carbonate	carbonate	sulphate
CaSO_4	$+ \text{Na}_2\text{CO}_3$	$= \text{CaCO}_3$	$+ \text{Na}_2\text{SO}_4$

The calcium carbonate settles as a precipitate while the sodium sulphate remains dissolved in the water, and, for boiler or washing purposes, is harmless in any ordinary amount. In water softening operations the treatment for the magnesium salts is practically identical with that for calcium salts. Mud in suspension is taken out of soft water by making a precipitate from two substances such as sulphate of iron and caustic soda, so that the precipitate in settling will carry down the fine particles of mud. The oil taken up by steam in engine cylinders is extracted from

the condensed water in the same way, so that the water may be used again in the boilers. For boiler purposes it is most important that the softened water should be freed from precipitate and made perfectly clear, because the presence of particles of solid matter suspended in the water is the most potent cause of boiler foaming. When the reactions take place, and the young and fine precipitates are formed, in the presence of old precipitate, an agglomerating action results which rolls the small particles together in balls so that they settle easy. This is the best method known for clarifying the water. The best machines in use for carrying out these processes are automatic in their action and require only to be supplied with chemicals and to have the settled precipitates discharged by opening a valve at the bottom of the settling tank, each once in 24 hours.

C. HIRSCHL KOHL,
Consulting Engineer, New York.

Water Spout, a remarkable meteorological phenomenon frequently observed at sea, and exactly analogous to the whirlwinds experienced on land. It occurs when opposite winds of different temperatures meet in the upper atmosphere, whereby a great amount of vapor is condensed into a thick black cloud, to which a vortical motion is given. This vortical motion causes it to take the form of a vast funnel, which, descending near the surface of the sea, draws up the water in its vortex, which joins in its whirling motion. The whole column, which after the junction extends from the sea to the clouds, assumes a magnificent appearance, being of a light color near its axis, but dark along the sides. When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, and is carried along the surface of the sea.

Water Supply. The several sources of water supply for cities are rivers of constant flow, lakes, natural and artificial, ponds, artificial impounding reservoirs, springs, shallow wells in the drift, and deep wells in the rock. The enormous amount of water consumed daily compels the larger cities of the world to seek their sources of supply in rivers and lakes; springs, natural reservoirs, and wells usually not yielding an amount of water sufficient to meet the daily demands. Exceptions are found in the city of Vienna, which seeks its source of water supply in the Schneeberg Mountains of the Austrian Alps; in Munich, which obtains its water from springs in the Mangfall Valley; New York, which draws its supply from large impounding reservoirs at the headquarters of the Bronx and Croton Rivers; Boston, which depends upon artificial reservoirs impounding the stream flow of the Sudbury, Cochituate and Nashua Rivers; Indianapolis, which obtains its water supply in deep wells in the limestone; Denver, which obtains its water from large impounding reservoirs in the valley of the South Platte River; and in one of the eight companies which furnish the water supply to the city of London, which draws its water from wells sunk in the London chalk formation. Excepting the Kent Works, all the remaining London water companies draw their waters from the Thames, Lea, and New rivers, with some small additions from wells and springs for the supply furnished by the East London and New

WATER SUPPLY

River Companies. London, Rotterdam, Hamburg, Bremen, Berlin, Saint Petersburg, Warsaw, abroad, Albany, Philadelphia, Washington, Cincinnati, Saint Louis, Nashville, Pittsburg, and Louisville, in the United States, are among the large cities depending upon rivers as their sources of supply. Glasgow, Liverpool, Manchester, and Zurich, abroad, and Buffalo, Cleveland, Chicago and Milwaukee of the large cities in the United States, have their sources of water supply in lakes. The lake which supplies water to Liverpool is a large artificial reservoir created in the Vyrnwy Valley in the north of Wales, distant about sixty-five miles from the city, from which the water is drawn first to filters at elevation sufficient to supply the filtered water by gravity to the city. Glasgow draws its water from Loch Katrine; Manchester from Lake Thirlmere; Zurich from the lake of that name, or from the River Limmat, the outlet of the lake, a short distance from its mouth; the American cities mentioned take their source in the system of Great Lakes. One of the most notable instances of large volumes of water from deep rock wells is in the supply to the city of Indianapolis, which obtains its water from twenty-five wells drilled into the water-bearing limestone which abounds in that section of the country. Of the twenty-five wells, twenty are 30 inches in diameter, and penetrate the drift and rock, distances ranging from 300 to 320 feet, with an average depth of 308 feet, and five are 8 inches diameter, with an average depth of 295 feet. The average thickness of the drift in the locality of the wells is about eighty feet. The gauged daily capacity of the twenty-five wells September 1898 was 18,700,000 gallons. In 1896 the yield of the system of driven wells which supplied water to Brooklyn was about 32,000,000 gallons. The principal cities abroad drawing their water from ground sources are Schalke, Dortmund, Cologne, Dresden, Bochum, Leipzig, Stockholm, and Copenhagen, with daily yields ranging from 6,000,000 to 11,430,000 gallons. The Vanne water, which is used for dietetic purposes in Paris, is obtained from springs, and to preserve it without change of quality it is conducted to the city in a closed conduit, received in distributing reservoirs, from which the light is carefully excluded, and reaches the consumer quite as pure as it was upon issuing from its mountain source. Cities have been located not according to the rules of hygiene, but according to the requirements of commerce; revenue rather than health has been the dominating factor, and upon the sanitarian has fallen the burden of rectifying the evils which have followed the total disregard in so many cases of one of the fundamental laws of health.

The various methods of supplying water to cities are embraced in the following systems: (1st) by gravity from natural lakes or impounding reservoirs at elevation sufficient to furnish domestic and frequently fire pressure; works typical of this system are found in New York, Boston, Baltimore, San Francisco, and Saint Paul; (2d) by pumping from rivers or lakes, or other sources, to reservoirs placed at elevation sufficient to supply under pressure water for domestic purposes, and often for fire protection; works typical of this system are found in the older works of Philadelphia, Pittsburg, Cleveland, Cincinnati, Saint Louis, Louisville,

Omaha, and Kansas City; (3d) by pumping from the sources mentioned under the second system to stand pipes, which fix the head upon the pumps and the distribution system, and supplying direct into the distribution mains; works typical of this system are found in Chicago, Milwaukee and Detroit; (4th) by pumping into the distribution mains without the intervention of stand pipes; works typical of this system are found in Indianapolis, Dayton, and Columbus.

Where impounding reservoirs are used at elevation sufficient to furnish a satisfactory pressure, these are invariably built with a view to carrying a volume of water which without the addition from rainfall would be sufficient to supply a city for at least six months, and naturally these basins become large sedimentation reservoirs, and the water as a rule is very satisfactory for drinking and other domestic uses. In the older works, where the water is pumped from rivers or lakes to storage and settling basins, the latter have been planned to contain several days' supply, and allow for a subsidence of the suspended matter in the water while retained in, or while passing through such basins. Where water is pumped under stand pipes, of course, no subsidence takes place, and the water is delivered to the consumer in substantially the same condition as it was taken from the source of supply. The same condition holds good for direct service works in which neither reservoirs nor stand pipes are used. Many of the smaller water-works built during the past twenty years have been carried out after the fourth system because it represents the least first cost, although less economical in operation than works which provide for pumping to reservoirs, or works pumping under stand pipes.

In the early history of impounding reservoir gravity works, and works in which the water was pumped to large reservoirs, it was thought a limited subsidence of a polluted river or lake water in such reservoirs would overcome all natural objections to the quality of the supply. It is now known that no surface water, whether gathered in streams or lakes, is fit for domestic uses excepting it be subjected to some method of purification which will eliminate the suspended matters due to sewage, and the washing of detritus from the water-sheds upon which the water is gathered. If it were possible to construct subsiding reservoirs of such capacity that the water might be retained for many days or weeks after being pumped from its source in order to secure a high percentage of subsidence of the suspended matters, this would remedy in part the objection to such water supplies taken from sources known to receive the effluents from city sewers, but the length of time required to successfully purify water in this manner is too great to admit of serious consideration of such a method of water purification for most cities, and filtration is resorted to as a means of doing in a short time what could be accomplished only in a very long time by means of sedimentation basins. Experiments with the water of the Ohio River at Cincinnati several years ago indicated that thirty days quiescent subsidence in reservoirs would reduce the bacterial content and turbidity about 97 per cent; filtration will rapidly reduce the bacterial content of polluted river and lake waters by 99 ± per cent, and almost entirely eliminate the turbidity. The reports of the performance of the filters at

WATER SUPPLY

Upper Roxborough (Philadelphia), where the water is carried for a short time in subsiding basins before it is thrown on the filters, show the remarkable change which can be made in a few hours by means of plain sand filters, and it is scarcely likely that in the future construction of works of public water supply many instances will be found where settling basins are planned to furnish more than two days' subsidence of the water before it passes to the filters for purification. The objection to any sewage polluted water is founded entirely upon the matters carried in mechanical suspension. The waters of large lakes or rivers probably never contain dissolved matters which unfit them for drinking and other domestic uses, nevertheless, few of these sources contain water which in its natural condition is fitted for drinking and other domestic requirements, and any system of purification which will remove all the suspended matter will be found capable of rendering the waters of large lakes and rivers well adapted for domestic purposes. The sole purpose of water purification is therefore to remove matters in suspension, of which the bacteria are a part, and as this can be accomplished much quicker, cheaper and better by plain sand filters than by large subsiding reservoirs, it is fair to presume that the latter will find few places in the future history of water-works engineering, excepting of course in such instances where the topography naturally suggests a gravity supply from impounding reservoirs of large capacity placed at an elevation sufficient to furnish the desired pressure in the street mains.

Consumption of Water.—One of the two most important problems in connection with public water supply at the present time is how to restrict the large and growing per capita consumption. Meters on the service pipes of consumers are thought by many to be the remedy, but while no one objects to the metering of the gas which he consumes, few outside of a small circle of water-works students favor the metering of water, the fear naturally being that with the advent of water meters the water bill will increase in size, or that the quantity of water allowed per consumer may be uncomfortably restricted. It does not follow that the use of water meters will generally increase the consumers' water bills, nor will the meter in any way limit the use of water, but a large consumption will require the payment of higher charges than for a small consumption.

Some idea of the per capita consumption of water in the larger cities of the United States can be gained from the following table:

CITIES 1900	Population supplied	Daily gallons	Per capita gallons
New York.....	2,444,000	245,700,000	100
Chicago.....	1,698,000	133,000,000	79
Philadelphia.....	1,594,000	187,188,000	117
Brooklyn.....	1,118,000	95,000,000	85
Boston.....	560,000	80,000,000	143
Cleveland.....	420,000	66,900,000	159
St. Louis.....	400,000	63,539,000	159
San Francisco.....	342,800	23,000,000	73
Cincinnati.....	325,000	30,600,000	94
Detroit.....	204,055	44,800,000	146
Milwaukee.....	300,000	24,000,000	80
New Orleans.....	287,104	13,820,000	48
Minneapolis.....	202,718	10,813,000	53
Providence.....	187,300	10,130,000	54
Indianapolis.....	169,184	13,400,000	79

Investigations in New York, 1900, by the Merchants' Association, showed meter measurements of water per capita per diem as follows: Of 25 houses where daily records for two weeks were taken in January, 18 used water at the rate of 51 gallons per capita, and 7 houses used water at the rate of 165.75 gallons per capita, or an average per capita consumption for the 25 houses of 91.36 gallons. At the same time, of 12 premises in Brooklyn 10 used water at the rate of 47 gallons per capita, and 2 used water at the rate of 121.45 gallons per capita, or an average for all consumers of 99.4 gallons per capita per diem. This consumption excludes the loss in the joints of street mains, but includes the loss from leaking fixtures. Mr. Croess estimated the per capita consumption as 116 gallons per day, which he thought by metering all domestic services could be reduced to 65,000,000 gallons per day.

The wide variation of consumption in different cities cannot always be easily accounted for. Thus in Denver the large per capita consumption can be attributed partly to the necessity of taking water from the street mains for all purposes, including irrigation of lawns, trees and shrubbery, and partly to the lack of necessity at the present time for an economical use of water, but why Cleveland, a manufacturing city, should use or waste water at three times the rate of Providence, another manufacturing city, cannot so easily be explained, excepting that in the latter city nearly all service pipes are metered, while few meters are used in the former. No individual consumer is ever ready to admit that he wastes water, and doubtless fancies that considering his actual needs, he is very careful to draw no more than the quantity required by his bare necessities. Nevertheless, aside from the leakage at the joints of street mains, which ought not to vary widely in different cities, equipped with modern cast iron pipes, there is a difference in the per capita consumption which can only be accounted for by differences in the habits of the consumers.

Mr. Dexter Brackett, in a paper to the American Society of Civil Engineers, 1895, from investigations in and around Boston, showed that the per capita consumption ranged from 6.6 gallons in small domiciles with a single faucet to 46 gallons in first class apartment houses. From the same source the interesting fact is obtained that for 12 of the larger cities of the United States, the consumption of water per capita has rapidly risen during the twenty years prior to 1894, thus:

CONSUMPTION — GALLONS, PER CAPITA, PER DIEM.

CITY	1874	1875	1877	1893	1894	Per cent increase
Boston, Cachituate.....	72	101	40

WATER SUPPLY

In considering the consumption of water per capita per diem, some thought should be given to the unavoidable losses by leakage of reservoirs, pipe distribution systems, service pipes, and domestic plumbing. It is customary to charge the whole pumpage, or draft from impounding reservoirs or other gravity sources to consumption, while as a matter of fact, with few exceptions, about one half the so-called consumption is lost through leakage of reservoirs, pipe systems, and plumbing fixtures, and of the remaining one half, supposed to be used, some waste might also be recorded. The information with reference to leakage of reservoirs is rather meagre, but it is well known that no reservoir is entirely watertight, and so long as the loss is not calculated to imperil the stability of dams, embankments, and like structures, nor create a costly or unallowable deficiency in the water supply, but little attention is paid to such losses.

Some data on the daily and percentage loss of water in concrete tanks, backed by well prepared clay puddle, from the new Philadelphia water-works (1903) is given in the following table:

LEAKAGE OF BELMONT FILTER TANKS.

Area (one filter) 31,800 square feet, depth of water 9 feet. Percentage leakage based on a daily flow of 4,380,000 gallons of water through each filter tank.

FILTER *	Leakage in 24 hours	Percentage loss
1.....	970	0.0221

* Filters tested to date.

LEAKAGE OF LOWER ROXBOROUGH FILTERS.

Area (one filter) 23,087 square feet, depth of water 9 feet.

Percentage loss of filters based on a daily flow of 3,180,000 gallons of water through each filter, and of 12,000,000 gallons per day through the clear water basin:

FILTER	Leakage in 24 hours	Percentage loss
1.....	885	0.0278
2.....	3,097	0.0974
3.....	1,770	0.0557
4.....	4,435	0.1391
5.....	1,770	0.0557
Clear water basin.....	1,075	0.00896

LEAKAGE OF UPPER ROXBOROUGH FILTERS.

Area (one filter) 30,928 square feet, depth of water 9 feet.

Percentage loss of filters, based on a daily flow of 3,195,000 gallons through each filter, and of 20,000,000 gallons per day through the clear water basin:

FILTER	Leakage in 24 hours	Percentage loss
1.....	0	0
2.....	0	0
3.....	690	0.0216
4.....	0	0
5.....	1,150	0.0360
6.....	460	0.0144
7.....	1,840	0.0576
8.....	1,150	0.0360
Clear water basin.....	3,300	0.00165

Each of these structures was under test for leakage from two to four weeks, the losses of level being taken by hook gauges reading to .001 foot, and corrections made for gain by rainfall, or loss by evaporation.

Leakage of Water Mains.—Like the leakage of tanks and reservoirs, information on the actual leakage of large pipe systems is not nearly as full as it should be, and the lack of it often leads to unpleasant discussions with contractors upon the reasonable allowable leakage of pipe systems when completed and offered for acceptance and use. It is convenient to state the leakage in gallons per day of 24 hours, per mile of pipe without regard to the various sizes embraced in the system. It is obvious that a mile of 48-inch cast-iron pipe should show and be allowed a greater leakage than a mile of 12-inch pipe, and it would be much fairer and more accurate to state the leakage in gallons per 1,000 (or other measure) linear feet of lead pipe joint, because the leakage whatever it may reach in gallons per day is almost exclusively at the joints. According to Mr. James R. Croess, in his report to the Merchants' Association, on the 'Waste and Consumption of Water in New York City, 1900,' the leakage of the pipe distribution system of that city is as high as 142,000 gallons per mile per day of 24 hours, and of Brooklyn, 60,000 gallons per mile per day; of Boston, 14,187 gallons per mile per day. The leakage of the pipe system of Fall River, where 94 per cent of all the water services are metered, is estimated as 24.40 per cent of the whole consumption; at Boston the leakage is estimated as 27.30 per cent of the whole consumption.

Carefully conducted tests for leakage of the several systems of pipe connected with the Bel-

WATER SUPPLY

mont Filters, Philadelphia, furnished the following information:

Main supply pipe, consisting of 1,900 feet of 48-inch pipe, 280 feet of 42-inch pipe, 670 feet of 36-inch pipe, 190 feet of 30-inch pipe, 360 feet of 24-inch pipe, and 340 feet of 20-inch pipe, total 3,740 feet, or 0.7083 mile, under a pressure of 50 pounds per square inch lost water at the rate of 4,030 gallons per day, corresponding to a leakage of 5,690 gallons per mile. Main effluent pipe, consisting of 2,610 feet of 48-inch pipe, 140 feet of 42-inch pipe, 120 feet of 36-inch pipe, 430 feet of 30-inch pipe, 470 feet of 24-inch pipe, and 730 feet of 20-inch pipe, total 4,500 feet, or 0.852 mile, under a pressure of 50 pounds per square inch lost water at the rate of 8,640 gallons per day of 24 hours, corresponding to a leakage of 10,140 gallons per mile. The raw water drain pipe consisting of 1,820 feet of 24-inch pipe and 840 feet of 20-inch pipe, total 2,660 feet, or 0.504 mile, under a pressure of 50 pounds per square inch, lost water at the rate of 5,040 gallons per day of 24 hours, corresponding to a leakage of 10,000 gallons per mile. The effluent drain pipe, consisting of 1,440 feet of 24-inch pipe, 570 feet of 20-inch pipe, and 440 feet of 18-inch pipe, total 2,450 feet, or 0.464 mile, under 50 pounds pressure per square inch, lost water at the rate of 2,448 gallons per day of 24 hours, corresponding to a leakage of 5,276 gallons per mile. The refill pipe, consisting of 1,670 feet of 20-inch pipe, and 760 feet of 16-inch pipe, total 2,430 feet, or 0.46 mile, under a pressure of 100 pounds per square inch, lost water at the rate of 6,480 gallons per day of 24 hours, corresponding to a leakage of 14,087 gallons per mile. The pressure pipe which supplies water under 80 pounds pressure per square inch to the sand ejectors and washers, consisting of 460 feet of 20-inch pipe, 750 feet of 16-inch pipe, 170 feet of 12-inch pipe, 360 feet of 8-inch pipe, 640 feet of 6-inch pipe, and 450 feet of 4-inch pipe, total 2,830 feet, or 0.536 mile, under a pressure of 100 pounds per square inch, lost water at the rate of 2,500 gallons per day of 24 hours, corresponding to a leakage of 4,664 gallons per mile. The average diameter per mile of each of these lines or systems of pipes is larger than that of cast-iron pipe in a city pipe distribution system.

Considering the percentage loss based on the daily flow of water through the pipes, the losses were as follows:

Line or Pipe	Percentage loss
Main supply	0.0101
Main effluent	0.0016
Raw water drain	0.1008
Pressure	0.0203

Filtration.—No single aspect of public water supply is to-day of more importance than the quality of the water supplied from day to day. Upon the quality of the water may rest the health and commercial welfare of a community. Many cities have been temporarily injured by the known bad quality of their water supply, and many distressful and costly epidemics of typhoid fever may be properly attributed to the temporary use of a sewage polluted water. The remedy for this condition may be found in changing the source of supply, when this is possible, but for some cities the only alternative is the adoption of some method of water

purification which will eliminate the germs of disease from the water. The only practical method of purification thus far adopted by cities is filtration, of which several systems have been tried, but only one of which, that is, plain sand filtration, has successfully withstood the test of time. The filtration of water for public use was first installed by Mr. James Simpson at the Chelsea Waterworks, London, 1838. Parliament in 1852 passed an act requiring all the so-called river works of London to filter their water before it was delivered to the consumers.

No substantial difference exists between the original plain sand filter proposed by Mr. Simpson in 1838 and the modern plain sand filter which is being carried out at the present time (1904) on a grand scale for the city of Philadelphia. In each case the filter consists of a masonry tank in the bottom of which are placed pipes to conduct away the filtered water; above and around the pipes is spread coarse gravel ranging in material as large as one's fist to coarse sand, upon which is placed a bed of so-called filter sand, with suitable arrangements in the matter of pipes and valves to control the rate of inflow of unfiltered water to the filter, and of filtered water from the filter to the clear water basin. However, the subsequent extended use of plain sand filters in several of the larger cities of Europe, notably Saint Petersburg, Warsaw, Dantzig, Berlin, Bremen, Hamburg, the works of London, Edinburgh, Liverpool, and other cities of the United Kingdom, has had the effect of largely improving the mechanism required for the proper control of such filters. It is altogether probable that the first filter built by Mr. Simpson at the Chelsea Works, London, may have given as satisfactory effluents as any built subsequently, but the lack of convenient and proper analytical tests at the date mentioned makes it impossible at the present time to show what changes were effected by Mr. Simpson's very simple yet very wonderful adjunct of water-works which are compelled to draw their supplies from sources of known or suspected sewage pollution.

The real merits of the plain sand filter were never understood until after the improvements in bacteriology, made by Dr. Robert Koch, became a part of water analysis, in fact all the refinements for the technical investigation of water supplies have been developed, and many of them perfected, within the last 20 years. If the means of technical water investigation had been as good 60 years ago as they are to-day, and the same interest felt by communities in the character of their public water supplies, filters would to-day be as much a part of municipal water-works (where the water is drawn from streams, lakes, and ponds which receive sewage effluents) as is the pumping machinery, storage, and settling reservoirs, stand-pipes, and the cast-iron or other mains which convey the water to the consumer. Pumps, pipes, and reservoirs are regarded as essentials of water-works, and the proposition to incorporate each or all in any system of works excites only ordinary business interest, and involves only two simple considerations: first, the capacity of such details; and second, the cost of construction, operation, and maintenance, while filters at the present time are still regarded, if not as unproven details of water-works con-

WATER SUPPLY

struction, certainly as details, the efficiency of which is still a matter of doubt; and this condition may be ascribed very largely to the lack of facilities for the technical investigation of water going to and coming from the older filters in the cities of Europe, rather than to any lack of efficiency in the performance of the filters. When Mr. James P. Kirkwood, the father of water-works engineering in the United States and one of the most distinguished members of the profession, visited Europe in behalf of the city of Saint Louis, to examine and report on the filters at that time in operation in London, Berlin, and other cities abroad, it is probable that the filters generally were performing as well then as they are now. Perhaps their work from day to day was not as regular as it is now because the means and facilities for measuring the work and controlling the operation of the filter were not at that time so well established as they are now. Substantially the only real attempt to improve the art of filtration of public water supplies since the publication of Mr. Kirkwood's classic report on the filtration of river water, and indeed since the introduction of the plain sand filter at the Chelsea Works in 1838, has been to reduce the cost of constructing and operating the filters, to materially increase the rate of percolation, or to maintain a constant high standard of efficiency without regard to the quality of the applied water. The only obstacle to the broad introduction of plain sand filters with suitable adjuncts for the purification of a sewage polluted public water supply, is the lack of confidence in the practical results to be obtained, and when this confidence is established, as it will be in due time, it will then be a matter of wonder why so many of the large cities of the United States like Boston, New York, Philadelphia, Baltimore, Cleveland, Cincinnati, Saint Louis, and Chicago have been willing to continue the use of polluted public water supplies for so long a time, when the remedy was to be found in engineering structures, simple of construction and operation, and as certain in the performance of their work as the highest class of pumping engine used to lift water from lakes and rivers to settling and storage basins, or to pump it under stand-pipes into the distribution mains. It is a fact not often recognized that in any large city upward of 90 per cent of the population, where the source of water supply is from the public mains, are wholly dependent upon the city, not only for the quantity but for the quality of their water for all purposes. Nine tenths of the people are unable, or unwilling, to adopt domestic appliances for the purification of polluted water, and unless the municipality undertakes to supply a satisfactory water, fully this proportion of the population, by force of circumstances or indifference, will continue to use such water as may come to them through the street mains, and any steps which a city may take to broadly improve the quality of its water supply may properly be regarded as an effort to improve the health of at least nine tenths of its population. The wealthier residents of any city may easily overcome the objections to a polluted water supply, so far as it affects their own homes only, by the introduction of domestic filters, many of which, if properly attended to, can be relied upon to fur-

nish satisfactory drinking and culinary water, but this is only a partial safeguard even to the users of the water, because it will guarantee satisfactory water only in their own homes, and when they leave their homes for places of business or pleasure they may be compelled to use the polluted water, and the effect of their individual efforts to improve the quality of the water in their respective homes will be partially lost. The influence on health of a bad water supply for a large city is not limited to the city, but will have a far-reaching effect on cities many miles distant by reason of the intercourse between the larger and the smaller cities. It is thus possible for the polluted water supply of a large city to partially defeat the effect of a very perfect supply in some of the smaller cities surrounding it, visitors from the smaller to the larger city drinking the polluted water, and carrying away the germs of typhoid fever, and other water-borne diseases.

As matter of interest in connection with the filtration of large volumes of water daily for city use, the following technical results from the operation of the Upper Roxborough filters, Philadelphia, are offered. These filters were first put in service during July 1903, and the results show how well they were performing within one month of starting. The daily capacity is 20,000,000 gallons.

Turbidity is stated in parts per million by the silica standard. The bacterial content of the water is stated in colonies per cubic centimetre of water sample:

OPERATION OF UPPER ROXBOROUGH FILTERS.

Belmont Filtration Works.—The Belmont Filtration Works will supply that part of Philadelphia which lies west of the Schuylkill River, consisting at present of a population estimated at 170,000, growing at the rate of 3.64 per cent per annum, and which, it is assumed, will have a population in 1950 of 550,000 in round numbers. The water supply is pumped from the Schuylkill River at the present Belmont Station, located on the west bank of the Schuylkill River about in the centre of the west division of Fairmount Park.

The works consist of two subsiding basins, executed partly in excavation and partly in embankment, having a total depth from the top of the embankment to the floor of the reservoir of 29 feet, and an available water depth of 25 feet. The reservoir consists of two divisions, known as the East and West Divisions, which contain a flow line of about 36,000,000 gallons, representing at the present time about 24 days' sedimentation of the water before it is drawn from the basins to the preliminary filters. Each basin has an inside and outside

slope of two horizontal to one vertical, the interior of the floor and the slope being first covered with a heavy layer of clay puddle rolled in place, over which is placed a five-inch thickness of concrete paving as a monolith, upon which up to within 10 feet of the high water line is placed a layer of asphalt $\frac{5}{8}$ -inch thick. The clay puddle consisted of 50 per cent of mixed clay and 50 per cent of clean stone ballast, tempered in an ordinary pug mill, and placed and rolled on the floor in two separate layers. Upon the slopes the puddle was rolled in layers six inches thick in excess of the actual requirements, and the surplus trimmed off to true slope lines.

From the sedimentation reservoir the subsided water is conveyed to a system of 20 preliminary filters, consisting of concrete tanks 60 feet long, 20 feet wide, and 8 feet deep, in which are placed materials very much like that in the plain sand filters excepting that the sand is more uniform of grain and coarser; the underdrain material at the bottom is likewise made up of coarser material and placed 12 inches deep, with suitable pipes to conduct the subsided water to the filters, and to conduct the pre-filtered water to the plain sand filters, and a system of wash pipes by means of which the bed of sand lying above the underdrain material is washed in place from time to time as may be required. The purpose of the preliminary filters at Belmont, and at the other works forming part of the improvement of the water supply of Philadelphia, is three-fold: first, to enable the plain sand filters to operate at a higher rate than has heretofore been employed, and correspondingly reduce the acreage of plain sand filter surface required to treat the subsided water; second, to prolong the life and increase the yield of the plain sand filters between scrapings from 60,000,000 or 70,000,000 gallons per acre, to from 90,000,000 to 150,000,000 gallons per acre; third, to obtain a more regular and better effluent than is possible with the plain sand filter when supplied only with water which has been undergoing subsidence for a few days. The preliminary filters are intended to perform in a short time what could be accomplished only in a very long time by simple sedimentation.

The plain sand filters at Belmont consist of 18 covered concrete tanks, arranged in groups of six each, having dimensions varying from 196 to 272 feet in length, and from 120 to 165 feet in width, giving a net area of filter at the sand line of 0.735 acre. The floors of the filters consist of concrete inverted arches 15 feet 3 inches square, with a depth of arch at centre of eight inches, a thickness of six inches at the centre, and of 14 inches under the piers. The roof arches have the same span as the floor inverts, a rise at the centre of 36 inches, a thickness at the crown of 6 inches, and of 15 inches at the spring line normal to the soffit. The roof arches are carried on monolithic concrete piers, 9 feet 1 inch high, 30 inches square at the base, and 22 inches square at and above the sand line, giving a total height from the centre of the invert under the floor to the centre of the roof arch of 12 feet 9 inches. Against the side and end walls of the filters a layer of concrete (mixed and placed as in the sedimentation reservoir) is rolled or rammed in place to render the filters watertight. The end

WATER SUPPLY

walls of all filters, and the side walls of the end filters, are designed as abutments to transmit the arch thrust to the foundation. In the roof of each filter is placed a system of ventilators which can be opened in the summer time to ventilate the filter when the sand bed is being cleaned, and the filter being prepared for another run, but in winter time these ventilators are closed in order to avoid freezing of the sand at any time when it is laid dry for the purpose of scraping. Above the concrete arched roof of the filter is placed a thickness of 36 inches of earth rolled in place, finished with top soil and seeded, in order that in due time the upper surface of the filter, as well as the slopes, will be covered with a neat turf, partly for protection of the materials in the earth fill over and around the filters, and partly to improve the appearance of the work. Each filter is provided with automatic regulators, one on the influent pipe to maintain a constant level of water over the sand bed, and the other on the effluent pipe to maintain a constant rate of operation of the filter, and incidentally to measure its rate and amount of work. The regulators are controlled by large copper floats which rise and fall with changes in the level of the water. In the effluent chamber the regulator consists of a telescoping weir which gradually descends in its guiding pipe until the depth of water in this chamber represents the maximum loss of head under which it is desired to work the filter. The relation of the lip of the weir to the copper float from which it depends is adjustable in order to vary the rate of percolation through the filter, thus when first put in service the rate of operation may be 1,000,000 gallons per acre per day of 24 hours, and in the course of two or three days the rate is increased to 6,000,000 gallons per acre per day, by the adjustment of the relation of the lip of the weir to the surface of the water in the effluent chamber. The telescoping tube slides through an annular cup leather packing, which maintains a watertight joint between the tube and the barrel into which it slides. In the centre of each filter at the bottom is placed a main collector with which are connected at intervals of 15 feet 3 inches the lateral collectors that reach from the main collector nearly to the side walls of the filter tank. The main collector is a watertight channel, constructed of concrete, and the lateral collectors are made of eight-inch and six-inch vitrified terra cotta pipes, perforated for their entire circumference from end to end. Around the main and lateral collectors to a depth of 16 inches above the lowest point in the floor of the filter is placed the underdrain material consisting of five sizes of gravel, ranging from three inches in diameter to material that will pass a No. 14 sieve and be intercepted on a No. 20 sieve, arranged in successive layers of six inches, four inches, three inches, and one inch, the smaller material, of course, being placed at the top in the one inch layer.

In placing the underdrain material in the filter, three different plans have been followed; one in which the material is placed horizontally from wall to wall of the filter impinging against the intermediate piers; another in which the underdrain material impinges against the piers but is kept a distance of 24 inches from the side walls, and still another, which is

regarded as the ideal arrangement, in which the underdrain material is kept 20 inches from the piers and 24 inches from the end and side walls. In the latter plan it is impossible for water to flow down between the masonry of the piers or walls of the tank, and pass into the underdrains without percolating horizontally through at least 20 inches of sand.

The sand in the filters consists of either river or bank sand, properly freed from clay, dirt, and organic matter, ranging in size from grains which will pass a sieve having six meshes to the linear inch, to grains which will not readily pass a sieve having 80 meshes to the linear inch. The sand is placed to a depth varying from 28 to 42 inches over the underdrain material, and constitutes the true filtering material. When the surface of the sand bed becomes clogged with the suspended matter removed from the water, and the maximum loss of head is reached, the filter is taken temporarily out of service, and the layer of sand at the surface is carefully scraped off for a depth of from one half to one inch, and heaped in little piles in the several bays of the filter. After the filter has been scraped the sand is thrown out by an ejector, worked by a current of water under pressure of from 60 to 80 pounds per square inch, to the sand washers in the courts in front of the filters, where, after it is washed, the sand is stored until such time as it becomes desirable by successive parings of the sand bed to renew the full depth of sand in the filter.

From the filters the water is conveyed through cast-iron pipes 48 inches in diameter, to a clear water basin constructed with concrete inverted arches under the floor, square plumb piers, and concrete arches of the same dimensions, and in the same manner as the filters, excepting that the total height from the centre of the floor invert of the clear water basin to the crown of the arch at the soffit is 18 feet, which provides for a water depth of 15 feet. From the clear water basin the filtered water is conveyed through cast-iron pipes into the distribution system.

The Belmont filters are intended to operate at the rate of 6,000,000 gallons per acre per day, giving a capacity for each filter in service of 4,410,000 gallons, corresponding to a rate of percolation through the sand bed of 19 feet per day of 24 hours, or of nine inches per hour. The daily capacity of the Belmont station (18 filters), allowing 15 per cent reserve for scraping, washing, and renewal of sand, and such other operations as may require filters from time to time to be temporarily out of service, is 65,000,000 gallons, although for the first two years they will be operated not in excess of the capacity of the preliminary filters, namely, 40,000,000 gallons per day. By the addition of 25,000,000 gallons preliminary filter capacity this station will be raised to 65,000,000 gallons per day, which is thought to be sufficient to meet the requirements of that portion of the city lying west of the Schuylkill River for a period of 25 or 26 years, after which time, not only will the preliminary filter capacity be raised, but additional filters will be built on land reserved for the purpose south of the present installation.

Population and Pipe Mileage.—The most expensive waterworks to build and maintain,

WATER SUPPLY

other things being equal, will be that in which the population per mile of pipe distribution system is the least. The city of Denver contains one mile of distribution pipe for every 304 of the population. At one time this city was supplied by two rival companies, and in many miles of streets the distribution mains are duplicated. Prior to the consolidation of the Denver Union Water Company and the Citizens' Water Company over 70 miles of the former company's mains had been paralleled by its rival, and the competition at one time was so strong that one or both companies actually furnished water to their consumers without charge; eventually the two companies combined in the Denver Union Water Company, and the consolidation then owned the mains of the two former companies. This fact, in part, accounts for the excessive mileage of pipe relative to population in that city. The influence of a dense population in Greater New York is shown in the very large population per mile of water pipe, which is nearly two and one half times that of Philadelphia and Saint Louis, and three times that of Boston. Omitting the cities of New Orleans and Nashville, in which, by reason of the large percentage of colored population, the mileage of pipe is small compared with population, New York, in which the population per square mile of territory is very large, and Denver, where the condition of pipe mileage is abnormal compared with population, it

will be seen that in all the other cities the relation of population and mileage of distribution pipe is fair, the population per mile of pipe increasing generally with the size of the city.

MILEAGE OF WATER PIPES OF VARIOUS CITIES AND THE POPULATION SUPPLIED.—1900.

City	Total mileage of water pipes	Total population	Population per mile of pipe

WATER SUPPLY

to unusual efforts in the attempt to reach an engine economy not attained by any other type of steam-engine. Higher steam pressures, higher piston speeds, higher expansions, and improved shop work have enabled the builders to obtain duties to-day which 20 years ago were thought by many to be unattainable with steam-engines. As a rule the more modern engines are being built in larger units, partly to diminish the cost for a given daily pumping capacity and partly by reason of the improved materials, design, and shop work entering into the construction of these machines which largely diminishes the probability of serious derangement or accidents in service. In the preceding tables all the engines noted are of the crank and fly-wheel type, all have steam jacketed cylinders, and with the exception of some of the pumping engines built by the I. P. Morris Company, all are constructed with single acting plunger pumps. The present cost (1904) for triple expansion crank and fly-wheel pumping engines per million gallons of capacity against 100 feet pumping head is about \$2,650.

Consumption, Income, Operating, and Maintenance Charges.—Interesting data on the operation of city water-works is found in the official reports of the cities, and in the statistics of the operation of private companies, from which it is shown that in a long established works, irrespective of population, water supplied per day and income, the operating and maintenance charges, excluding expenditures for extensions and betterments, fixed charges on bonded indebtedness and taxes (which, of course, are paid only by private water companies), are roughly about 30 per cent of the income from water rents. In exceptionally well managed works, like those of Providence, R. I., and Milwaukee, Wis., in both of which meters form a part of the water supply system, the operation and maintenance charges are considerably less than 30 per cent of the income from water rents. In other works where the management is less systematic and rigid, or where the conditions connected with the supply of water are more onerous than in the cities mentioned, the operation and maintenance charges are considerably more than 30 per cent of the income. In determining the income

which should be received from water rents by a system of water supply, whether operated by the municipality or by a private company, in which it is known that the property is conducted in a careful and economical manner, it will often assist the managers to know the relation which the income from water rents should bear to the known cost of operation and maintenance, and this being known, to adjust the water charges equitably among the various kinds of consumers to produce the income required to meet all the natural charges created by a system of public water supply. These charges may be divided conveniently as follows: first, operation and maintenance charges; second, extension and betterment charges; third, taxes, if the works are owned and operated by a private corporation; fourth, the fixed charges on the cost of construction or bonded indebtedness; fifth, an annual allowance for the renewal of such parts of the works as, for example, pumping engines and boilers, which are subject to a known rate of deterioration; and sixth, if the works are owned and operated by a private company, a reasonable allowance for dividends on the capital stock.

The last five items will usually absorb in round numbers about 70 per cent of the income from water rents.

The table below is an abstract from an elaborate compilation of statistics from the cities noted, which was used a few years ago in the trial of a cause in the United States courts to adjust a difference between the municipality and the water company. In this particular instance it was a well established fact that the works were well constructed, and operated upon a very careful and economical basis, and in order to furnish data upon which the court could safely fix the income to which the water company was entitled, it was necessary to arrive at this income in the indirect manner shown by the table.

Where the quantity of water to be pumped is small, it will often be found very convenient to use gas or gasoline engines and triplex pumps. Works up to 2,500,000, or more, gallons per day have been planned and are operating on this system. The advantage of the gasoline engine is that it entirely avoids the ex-

WATER TABLE—WATER WHEEL

pense for boiler house, the cost of operating and maintaining boilers, the expense of chimneys, and if the water is pumped to reservoirs, whenever the machinery is temporarily out of service there is no cost due to banking fires and maintaining steam pressure, as is the case with a steam operated works. See **WATER-WORKS**.

JOHN W. HILL, C.E.,
Formerly Chief Engineer, Department of Public Works, Philadelphia, Pa.

Water Table, in architecture, a projecting stone sloped on the roof to throw off water. It occurs in buttresses and other parts of Gothic architecture.

Water Thermometer. See **THERMOMETER**.

Water-thrush, an American warbler of the genus *Seiurus*, having terrestrial habits and frequenting preferably the borders of streams; its domed nest in the woods gives the name oven-bird to the common resident species (*S. auricapillus*). See **WARBLER**; **WAGTAIL**.

Water Turbine. See **TURBINE**; **WATER WHEEL**.

Water-turkey. See **DARTER**.

Water Valley, Miss., city, one of the county-seats of Yalobusha County; on the Illinois Central railroad; about 140 miles north by east of Jackson, the State capital, and 15 miles north of Coffeeville, the other county-seat. It was settled in 1855 by William Carr; incorporated in 1867, and chartered as a city in 1890. It is in an agricultural region, in which cotton is one of the principal products. It has considerable lumbering interests. The chief manufacturing establishments are cotton mills, railroad repair and construction shops, in which there are 500 men employed, a lumber mill, foundry and machine shops, and woodworking factory. The city owns and operates the electric-light plant and the waterworks. There are seven Church denominations, the Methodist State Orphan's Home, the McIntosh Training School, and public schools for both races. The two banks have a combined capital of \$48,000. The government is vested in a mayor and board of aldermen consisting of seven members elected every two years. Pop. (1890) 2,832; (1900) 3,813; (1910) 4,708. G. D. BROWN,

Editor 'The Progress.'

Water Wheel, a device by which the motive energy in falling water is utilized to perform mechanical work. Water acts as a motive power by its weight, or by pressure and impact, and the water wheels adapted to these various conditions may be divided into two general classes—the "vertical," consisting of the "overshot," "breast," and "undershot" wheels; and the "horizontal," which includes a great variety of turbine or reaction wheels. The impact or impulse wheels are included in both classes. The term water wheel is correctly applicable to all forms of water motors that rotate, but in the present case it will be restricted to those of the vertical class which are actuated mainly by the weight of water loaded on their circumferential parts. For those belonging to the horizontal class, see **TURBINE**.

The overshot wheel is provided with a number of buckets fixed to its periphery in such a way that as the wheel revolves from left to right the buckets on the descending side have their tops upward, and being filled with water at or

near the top of the wheel, exerts a downward pull and imparts a rotary tendency to the wheel. The water is admitted to the wheel by various methods, such as the overfall sluice, the penstock, and the guide bucket, in all of which the water is guided in a course tangential to the buckets, and acts partly by impact, but principally by weight. To obtain the greatest efficiency, the number of buckets ought to be as large as possible and so arranged as to hold the water as long as practicable. The buckets vary in form, but the greatest effect is obtained from curved buckets, the "radial" giving only about 75 per cent of the power obtainable by the use of "elbow" buckets. Overshot wheels may be constructed of wood or iron in any size. The earlier forms were massive structures built of wood, and often measured 70 feet in diameter, but the modern wheels are generally built of iron and are practically limited by construction to falls less than 60 feet in height.

In the breast wheel the water is received by the buckets above the centre and below the top of the wheel. It is most effectively employed in connection with falls ranging from 5 to 20 feet, and where the flow ranges from 5 to 90 cubic feet per second. The buckets are generally held in a curb, and, not being required to hold water, are set radially. Their number is made as large as possible, and they are set at such an angle that they leave the water vertically so as not to carry up water from the tail-race. The breast wheel is more effective than the overshot under a variable water supply, since it can be made of a greater diameter and affords an increased facility for the reception and discharge of the water by the buckets.

The undershot wheel receives the water below its horizontal centre line. Instead of buckets it is equipped with a series of paddles or vanes fixed to the periphery in such a way that the flowing water passes under the wheel, pushes against the paddles, causing rotation. It is usually set in a curb with a minimum amount of clearance for the escape of the water. The most effective curbs are concentric to the wheel, those set straight or tangential allowing too much waste. The paddles are set radially and inclined upward in order to be readily relieved of water upon the return side.

For falls not exceeding six feet, the most effective wheel is the Poncelet. In it the water acts in a manner very similar to its action in a turbine, and although not quite as efficient as turbines working under normal conditions, it is superior when working under a reduced water supply. The buckets are curved, and the water flowing along their concave sides presses upon them without impact and with greater effect than that of water impinging at right angles against buckets with plane surfaces. The effect of the wheels increases with the depth of the water, and the velocity of rotation is equal to about one half the velocity of the flowing water. The simplest form of the "impact" wheel consists of a series of rectangular buckets fixed upon a wheel at an angle varying from 50 to 70 degrees to the horizontal. The water is conducted to it through a pyramidal flume set at an angle varying from 20 to 40 degrees, so that it strikes the blades nearly at right angles. The normal effect is about 5 per cent of the total mechanical power of the flow, but this may be increased somewhat by increasing the length of

WATER-WORKS

the paddles, so that the water exerts a combined impinging and pressing force.

In another form, known as the "impulse" wheel, a series of cup-shaped buckets attached to the periphery of the wheel are acted upon by a jet of water conducted by a pipe and delivered through a nozzle tangentially against the cups. Of this form the most notable are those of the Pelton type, which vary from 5 to 20 feet in diameter and are extensively employed to work air compressors in mining operations. A wheel of the maximum size is capable of developing 350 horse-power, under a 700-foot head of water.

In general, as compared with turbines, vertical water wheels are the more effective when applied to falls ranging from 20 to 40 feet. The turbines are more efficient with low falls, on account of the great hydraulic resistance developed by very high falls, which increases as the square of the velocity. On the other hand, since turbines are run at a greater number of revolutions, they are more suitable to general mechanical purposes, while vertical wheels are better for purposes requiring low velocities, and in the operation of rolling mills where the varying resistances are controlled by the mass of the wheel.

There is not much difference in the cost of construction, but the durability of the turbine is less than that of the vertical wheel.

Bibliography.—Good descriptions of water wheels are scattered through the various engineering periodicals. Especially valuable data may be obtained from Weisbach, 'Hydraulics and Hydraulic Motors,' English translation by Du Bois (New York 1877); and Bjorling, 'Water or Hydraulic Motors' (London 1894). See also **TURBINES**; **WATER-POWER**; **WATER MOTOR**.

W. MORSE, JR.,
Consulting Civil Engineer.

Water-works, systems of machinery and engineering structures, employed to supply water to individual manufacturing, mining, and milling plants, and to municipalities, for domestic and industrial uses. Such systems existed during very early periods of history, and the water-works of ancient Greece, Carthage and Rome may be readily traced and studied by the ruins of their reservoirs and masonry aqueducts. In these earlier systems, gravity was depended upon for the delivery of the water, but force pumps were introduced about the middle of the 16th century, and extended greatly the general application and use of water-works systems. Of these the water-works built at London Bridge by Peter Maurice 1562 appear to be the first. The installation consisted of 16 force pumps, each 17 inches in diameter, and 30 inches long, which were driven by a current wheel, and raised 311,000 gallons of water per day to a reservoir at an elevation of 120 feet above the pumps, and from which the water was delivered by gravity, through lead pipes to buildings in the immediate vicinity.

In the United States, the first pumping plant installed to provide water for municipal purposes, was that at Bethlehem, Pa., about 1760. It consisted of a five-inch wooden force pump, which raised water to a height of 70 feet through pipes of bored hemlock logs. This was replaced in 1761 by three single-acting iron pumps, each 4 inches in diameter, and of 18-inch stroke, op-

erated by an undershot water-wheel. The first municipal water-supply system built in America, however, was that of Boston, in 1652. It was built by the Water-Works Company, and consisted of a reservoir about 12 feet square, to which the water from springs in the vicinity was conveyed through wooden pipes. From 1652 up to the close of the year 1800, the water-works plants in the United States numbered 16, and had been located and built at the following named cities: Boston, Mass., 1652; Bethlehem, Pa., 1754-1761; Providence, R. I., 1772; Geneva, N. Y., 1787; Plymouth, Mass., 1796; Salem, Mass., 1795; Hartford, Conn., 1797; Portsmouth, N. H., 1798; Worcester, Mass., 1798, Albany, N. Y., 1798-1799; Peabody, Mass., 1799; New York City, 1799; Morristown, N. J., 1799; Lynchburg, Va., 1799; Winchester, Va., 1799-1800; and Newark, N. J., 1800. With the exception of the plants at Winchester and Morristown, they were all built by private concerns, but passed into the ownership of the respective municipalities from time to time up to 1860. The works at Winchester were built by the municipality, and those at Morristown were built by a private concern and still remain in private ownership. From 1800, up to the present time (1904), the number of plants installed throughout the country amounts to about 3,200, of which 1,700 are under municipal, and 1,500 under private control.

A clear and concise consideration of the subject of water-works may be facilitated by arranging the various requirements under the four general headings—quality, sources of supply, modes of distribution, and public policy.

Quality expresses the fitness of the water for the various purposes for which it may be required. A good quality of water is characterized by a freedom from turbidity and color, unpleasant taste and odor, and sewage contamination.

Turbidity is a condition caused by clay and silt suspended in the water. When the source of supply is a river, this condition is subjected to great variations according to the amount and character of the rainfall over the watershed. Heavy rains of short duration are drained off with great erosive effect, and introduce into the flowing rivers vast quantities of finely divided inorganic matter. This impurity, however, is more offensive than harmful, unless taken into the system frequently or in large quantities. It is removed by the use of large settling reservoirs where the water is allowed to rest and deposit the heavier particles, before it is passed over the filter-beds by which the smaller particles are removed. (See **WATER SUPPLY**.) Color is a condition still more offensive to the eye than harmful to the health. The apparent color due to turbidity disappears under the processes of sedimentation and filtration, but true color, generally due to infusion of vegetable organic matter, such as leaves, grass, etc., is much more difficult to remove.

Odor is a condition which, although less frequent, is much more harmful than turbidity or color. As a rule it is due to the life processes of minute organisms, and is removable to a considerable degree by filtration.

Sewage contamination is the most harmful of all the various forms of impurities natural or artificial that a water supply may be subjected to, and is the direct cause of epidemics of typhoid fever and various troubles of the intes-

WATER-WORKS

times, which by undermining the constitution reduces its power of resistance to diseases. The water may be somewhat purified by filtration, but the proper method is to remove the source of pollution.

The quality of water is ascertained by various kinds of analyses, physical, chemical, and bacteriological, which, however, at their best, are only capable of indicating the probable safety or danger of a given sample of water. Physical analyses consist merely of comparisons of the given samples with standard solutions, and afford data relative to temperature, turbidity, color and odor.

Chemical analyses indicate the time of past contamination, and the nature of its origin—animal or vegetable. Bacteriological analyses are principally used to ascertain the absence or presence of the growths which cause bad taste and odor. Such analyses are capable of showing the number and probable origin of the bacteria present, but in matters of differentiation, as in the case of the typhoid germ from the harmless water bacteria, their operation is quite uncertain.

The results obtained by any set of analyses are generally interpreted by chemists and engineers by comparing them with other known facts, without attempting to establish a system of arbitrary standards. A minimum limit of impurity, however, may be stated, as follows:

(1) The best authorities consider water as bad or polluted when 100,000 parts of the liquid contain more than three parts by weight of mineral matter or one part by weight of dry organic matter, before it has been submitted to precipitation, or when it holds in suspension more than one part by weight of dry organic matter after 6 hours of perfect repose in a reservoir.

(2) When the same amount of liquid contains in solution more than two parts by weight of organic carbon, or three parts of organic nitrogen.

(3) If it exhibits a distinct color under daylight when placed in a white porcelain dish, to the depth of one inch.

(4) When 100,000 parts of the liquid contain more than two parts by weight of any metal except calcium, magnesium, potassium and sodium.

(5) When 100,000 parts of the liquid contain in solution, suspension, or chemical combination, more than 0.5 of metallic arsenic.

(6) When 100,000 parts of the liquid, after the addition of sulphuric acid, contain more than one part by weight of free chlorine.

(7) When 100,000 parts contain more than one part by weight of sulphur in the form of sulphuretted hydrogen, or a soluble sulphuret.

(8) When 100,000 parts of the liquid holds in suspension more than 0.5 of petroleum or hydrocarbon, or exhibits a film of the same upon its surface.

(9) When the acidity is greater than that produced by two parts by weight of hydrochloric acid to 1,000 parts of distilled water.

(10) When the alkalinity is greater than that produced by adding one part by weight of caustic soda to 1,000 parts of distilled water.

(11) When a cubic centimetre of water contains more than 250 bacteria.

In general, a large percentage of chlorine, and high nitrates, together with the presence of *coli communis*, a bacteria found in large quanti-

ties in the human intestines, indicates sewage contamination.

A very simple but reliable test for sewage contamination was suggested by Heisch. To half a pint of water placed in a clear colorless glass-stoppered bottle, add a few grains of the best white lump-sugar, and expose the bottle freely to daylight in the window of a warm room for a week or ten days. If the water remains clear it may be considered safe, but if it becomes turbid, it is open to grave suspicion of sewage contamination.

Turbidity or a precipitate due to the addition of baryta water indicates the presence of carbonic acid; chloride of barium indicates sulphates; nitrate of silver indicates chlorides; oxalate of ammonia indicates lime salts; sulphide of hydrogen, slightly acid, indicates antimony, arsenic, bismuth, calcium, copper, gold, lead, mercury, platinum, silver and tin; an alkaloid by ammonia solution of sulphide of ammonium, indicates alumina, chromium, cobalt, iron, manganese, nickel and zinc. While the chloride of gold or mercury and the sulphate of zinc indicate organic matter.

Hardness of water is a quality that bears chiefly upon its use for washing purposes. The hardening impurities are principally the salts of lime and magnesia. Their carbonates produce temporary hardness which may be removed by boiling, when the carbonic acid is dissipated and the insoluble bases are deposited as incrustations on the bottoms of the kettles and boilers. The carbonates are less troublesome to the human constitution than to steam users, but the sulphates, chlorides and nitrates of lime cannot be dissipated by ordinary boiling and are productive of what is known as permanent hardness. Ordinarily pure water can take up only about 2 grains of carbonate of lime per imperial gallon of 70,000 grains, but when carbonic acid is present, that amount of water will dissolve as much as 20 grains of the carbonate. The degree of hardness is estimated according to the number of grains of soap the solution is capable of neutralizing. Thus, one, two, and three degrees of hardness represent the neutralization of 10, 20, and 30 grains of soap, respectively. The amount of waste, in the wear of clothes and soap, and the destruction of many valuable food properties by the use of hard water is not fully appreciated by the general public. It is safe to state, that the money value of that waste far exceeds the cost that would supply an abundance of water for domestic purposes from a source free from impurities.

Systematic processes for softening water have been employed but rarely in the United States, and then principally in connection with the boiler and locomotive manufacturing plants. The first process was invented by Prof. Thomas Clark, of Aberdeen, Scotland, and 1841, and consists of mixing the water supply with lime water or milk of lime, and allowing it to subside for a period ranging from 12 to 24 hours, when the water is drawn off while the precipitate is left behind. The only softening plant in connection with a municipal water supply in America is that attached to the water-works of the city of Winnipeg, Manitoba. The source of supply is a number of artesian wells, and the water obtained is of a very hard quality. The softening process employed is a modification of that of Clark, and includes a variety of set-

ting and filtering devices, into which the water is pumped and mixed with the lime solutions and then drawn off and distributed by direct pressure pumping into the mains. Its working, although not satisfactory in many ways, provides a water more beneficial to the health, and superior for domestic purposes, than that of the Red River, which formed the original water supply of the city. (See WATER SOFTENING.)

While boiling is a very cheap and thoroughly effective process of purifying water, and may be used by householders in general, distillation, owing to its expense, may be employed only in special cases, in connection with artificial ice plants, the conversion of salt into fresh water at sea, and in the various industrial arts. It will be noted, however, that both boiled and distilled water are very unpalatable unless aerated before used for drinking purposes.

Sources of water-supply will be found extensively treated under that title. In a general way, the origin of all sources is the atmosphere. It is a simple matter to trace the course of the water from the clouds in the form of rain to the rivulets which form the feeders to the lakes and rivers, and which percolating through the porous rocks and earth, issue as sparkling springs along the valleys. Some special suggestions, however, relative to the selection of a potable water is advisable in this connection. In the open country water reaches the ground in a fairly pure condition, and by selecting a site isolated from the drainage of barnyards, house sewerage, and fertilized gardens, an excellent quality of water may be obtained from a well. Extending the application to where the supply is for the use of a community, town or small city, subterranean reservoirs in which the great rain percolations are stored up, may be tapped by artesian wells and furnish an inexhaustible supply of pure water. In boring these wells, however, a thorough knowledge of the geological structure of the region is important (see ARTESIAN WELLS), in order to avoid unsuccessful and costly boring operations, as well as to obtain a sufficient quantity of water free from sub-surface impurities. Waters percolating through or over the crevices of granite, gneiss, serpentine, trappean, mica-slate or silicious sandstone and drift formations, are usually quite pure, since the disintegrations of such formations are not soluble in pure water. On the other hand, limestones and chalks impart objectionable qualities. Carboniferous rocks are often composed largely of mineral salts, and the water penetrating such strata are of a briny nature and are wholly unfit for domestic use. This is the case in the Kanawha Valley, and in some parts of Ohio, West Virginia, and the State of New York. In the bituminous limestones of the oil regions of Pennsylvania, the waters passing through those strata are saturated with petroleum compounds, while the dark waters issuing from the sulphurous rocks of the Niagara group of the Ontario geological division carry a high percentage of sulphuretted hydrogen.

As the municipality requiring the water increases in size, the quantity obtainable from a source of supply becomes more and more important. The per capita consumption varies greatly and very often quite unexplainably. See WATER SUPPLY.

In the ancient cities of Jerusalem, Rome,

Byzantium and Alexandria, the consumption amounted to 300 gallons per capita, daily.

In 1870, the water consumed by the principal European cities, in gallons per capita, was as follows: London 20, Liverpool 27, Glasgow 40, Paris 30, Marseilles 40, Genoa 30, Geneva 16, Madrid 16, and Berlin 18. On the other hand, it is not an unusual thing to find American cities consuming all the way from 100 to 250 gallons per capita. Without doubt, a great deal of the water in such cases is really wasted, but American hydraulic engineers in planning for a water supply under the present conditions, calculate upon the basis of a consumption of 100 gallons per capita, with provisions to meet an increased demand in the near future.

A fair average daily consumption may be approximately estimated as follows, in gallons per capita, on a basis of total population: For ordinary domestic purposes, 20 gallons; for private stables, including carriage washing, 3 gallons; commercial and manufacturing purposes, 16 gallons; fountains, drinking and ornamental, 10 gallons; fire protection, 3 gallons; private hose and sprinkling of streets and public grounds, during the four or five driest months of the year, 10 gallons; waste to prevent the freezing of water in the service pipes and house fixtures in northern cities, during the three coldest months of the year, 10 gallons, and waste by leakage, and for flushing purposes, 10 gallons; a total of about 80 gallons.

Thus for the larger cities, the selection of a source of supply passes from the wells and springs to the large ponds and lakes. Important examples of such are found in the cities of Chicago and Milwaukee, which draw their supply from Lake Michigan, and Cleveland and Buffalo, from Lake Erie. In the majority of cases the principal cities of the world obtain their water from rivers, although a great many, as in the case of New York, which draws its supply from Croton Lake, have adopted certain natural basins and converted them by artificial means, such as dams, etc., into immense reservoirs, fed solely by the rainfall over the drainage area. In such cases the principal mode of delivering the supply at the point of consumption is by gravity, through aqueducts, connecting the source of supply with the distributing mains. Intermediate settling and filtering reservoirs may be employed in connection with the source of supply to neutralize the conditions of turbidity, color, etc., inherent to surface waters, while auxiliary pumping stations may be built and operated in connection with standpipes if any part of the area using the water happens to be higher than the level of the source of supply.

On the other hand, when a river is the source of supply, its natural position in the lowest part of the valleys compels the elevating of its waters before delivery to the consumers. This is usually accomplished by pumping plants which elevate the water into reservoirs or standpipes from which it is distributed by gravity, or it is pumped direct into the distributing mains and thence into the service pipes. In either case, in planning a system of water-works, it is essential that proper provisions be made to insure a pressure of delivery that is constant and adequate to supply the consumption per capita for all domestic and industrial purposes, and of sufficient power to throw fire streams over the tops of ordinary buildings. A combination of the gravity

WATER-WORKS

and pumping systems is employed by the city of Washington. From the Great Falls of the Potomac, situated several miles west of the city, the water is conveyed through a conduit to receiving reservoirs on the heights adjacent to the city and after a period of subsidence is passed into the distributing reservoirs and thence to the service mains. Certain portions in the north-western and northeastern parts of the city being higher than the receiving reservoir, pumping stations connecting with the distributing mains pump the water into standpipes in the elevated sections, from which it is delivered to the consumers by gravity. As a rule, the cost of establishing pumping systems to lift the water from the river from a point near at hand to the standpipes, is far less than that of building the necessary aqueducts to conduct the water from a point on the river a sufficient distance beyond to insure the required head or pressure. In the case of Washington, however, the arrangement is practically necessary since the sewage of the city flows into the river in the immediate vicinity, and the current of the river itself is affected by the ebb and flow of the tide to some distance above the city, so that the water immediately at hand is in a polluted condition. In this connection it may be mentioned that but a very small number of American cities are fortunate enough to obtain an abundant supply of water directly from natural sources sufficiently transparent and limpid for domestic purposes. The great majority are compelled to resort to artificial means of various kinds, such as storage and settling reservoirs, filter beds, and pumping plants, to insure the purity and quantity required.

The character of "pumping plants" varies according to the source and mode of supply, the motive power employed, and the working pressure on the pumps. In connection with the source and mode of supply, such plants are arranged for direct pumping, or for pumping into a reservoir. Direct pumping plants are liable to be affected by great and sudden changes in working pressure and therefore require machinery capable of responding quickly to such changes, with strong and simple working parts automatically regulated under variable speeds. On the other hand, since the machinery employed to pump into a reservoir works against an almost constant head or pressure, at a practically uniform rate of speed, a much greater latitude is presented in the economy of design and operation.

As a general rule, when the source of supply is more than 25 feet below the surface of the earth, economy in the matter of excavations and foundations compels the use of some form of a vertical rather than a horizontal pump. If the well is very deep two sets of pumps, one at the bottom and one at the surface, may be employed, or by the use of the air lift, the motive power may be kept at the surface of the ground. On the other hand, when the water has to be pumped from a river to a settling reservoir for purification, and then repumped into the distributing mains, under conditions involving a comparatively low lift, some form of horizontal or centrifugal pump is the most suitable. See PUMPS AND PUMPING MACHINERY.

Relative to motive power, it is evident that water power, when it can be obtained in a sufficient amount, is the ideal source of energy, since it is generally inexhaustible and always

cheap. If, however, it cannot be obtained during the whole year, it may be supplemented by steam or electric power, or by a system of storage reservoirs arranged to equalize the flow of the stream under the varying conditions of wet and dry seasons. The employment of steam, electric and compressed air power to operate pumping plants depends to a great extent upon the cost of fuel used. When the pumping plants are situated at points far from the fuel supply, they may be operated economically, within the limits of economical electric power transmission, by power derived from dynamos driven by steam-engines or the energy of waterfalls. Compressed air may be used to operate small plants located at a distance from the main plant, and also to operate air lifts where deep wells are the source of supply, while oil and gas engines are the most economical for operating isolated secondary pumping plants in large cities, or the main pumps of small towns and villages. It is a fact, however, that in a majority of the water-works throughout the world, steam is the motive power employed, the pumping engine usually combining the motive power and pump action in one machine. They are of several different types, and the adoption of any particular one depends practically on the cost of the fuel used. When that cost is great, high duty engines, although more expensive in design and construction, but capable of performing a relatively larger amount of work with a small amount of fuel, are adopted. See PUMPS AND PUMPING MACHINERY.

For specific information on the construction of reservoirs, filter beds, tanks and standpipes see WATER SUPPLY. In general, the most important point to be considered in planning a system of water-works, is that of procuring an ample and suitable supply of water. To insure this, natural bodies of water, such as ponds and lakes, are connected with reservoirs by dams across their outlets, or by large masonry structures, partially in excavation and partially in embankment, from which reserve supplies of water are drawn off into the distributing system to maintain a constant pressure under varying demands. Tanks and standpipes are practically small reservoirs, usually located above the ground, on wooden, steel, or masonry towers. Their specific application has been described in connection with pumping plants.

Standpipes placed upon the force mains are employed by several American cities, whose reservoirs are distant from their pumping stations to equalize the resistance against the pumps. Those at Louisville, Milwaukee and Saint Louis are examples. Other cities, such as Chicago and Toledo, where proper reservoir sites are unobtainable, use open-topped standpipes of considerable height, ranging from 150 to 275 feet. They serve as partial substitutes for relief valves acting in conjunction with tall chambers. In the standpipes the surface of the water rises and falls according to the rate of delivery into them by the pumps and the rate of draft when the main over which they are placed is connected with the distributing system. In northern cities they have to be housed to prevent the water from freezing during the winter.

The water obtained by any of the methods already described is supplied to the consumers by distributing systems comprising the various kinds of mains, service pipes, house fixtures, valves and hydrants which control the flow and

the delivery of the water, while various kinds of meters record the amount consumed and afford a basis for taxation. See WATER METERS.

Such systems often include distributing reservoirs, tanks, and standpipes, and sometimes auxiliary pumping plants. They usually consist of one or more trunk mains from which numerous branch pipes, continually diminishing in size, lead through under the surface of the streets and connect with the various buildings. The mains are usually of cast iron, although wooden pipes have been and are even at the present time used under certain conditions. Under a direct pressure system, when the water is pumped through such a pipe, it is called a force main. Originally they were of wrought iron, but proving unreliable were superseded by cast iron and finally by those of riveted steel. See PIPES AND PIPE MANUFACTURE.

The size of water mains depends upon the required volume and velocity of the water conveyed, and vary from 48 to 72 inches in diameter. Pipes leading to fire hydrants should not be less than four inches in diameter, and when of that size should be restricted to lengths not exceeding three or four hundred feet and leading to a single hydrant. Service pipes are usually of lead or wrought iron. Lead pipes, although more expensive, are preferable on account of their flexibility, smooth interior surface, great durability, and relative non-corrosiveness. Plain wrought-iron and galvanized-iron pipe corrodes so rapidly that it is unfit for use unless coated both inside and outside by asphaltum or varnish of some kind. Various substances have been applied for that purpose from time to time, while interior linings of cement have been used extensively; but the present practice is confined to the application of an asphaltum bath, with perhaps the most satisfactory results obtainable. It consists simply of a mixture of coal tar and asphaltum in proportions that will give a coating non-brittle at the freezing point.

Valves are employed to control the water as it flows into the mains and from them into the service pipes. Pipes are always liable to accident through excavations for buildings, sewers, electric conduits, overflows, and quicksand and clay slides. It is also very often necessary to shut off the water when new hydrants are attached, or when large pipe connections or repairs are made. Under such circumstances means to maintain a constant supply at and beyond the points involved are best obtained by a duplicate arrangement of sub-mains in parallel lines at several squares distance, joined across by a system of smaller service mains, so that there are always at least two lines of sub-mains around any given point. Under such conditions stop-valves may be used with advantage to shut off the water from a particular point without cutting off the supply from what may be a large territory lying beyond. Stop-valves are made in a great variety of forms, but the best have double self-adjusting disks, with the seats slightly divergent, so that the pressure of the screw sets the valve-disks snug upon the seats. They are usually located on the mains under some invariable system so that they may be readily found in case of accident when hidden by a cover of frozen earth, snow, or other debris. Blow-off and waste valves are attached to pipes laid upon undulating ground, and are used to

flush out the sediment deposited from unfiltered water, in the principal depressions of mains and sub-mains. Their diameters are usually about one half that of the mains from which they branch and they may be led into sewers or wherever the waste water may be disposed of. Valves commonly known as corporation cocks regulate the flow into the houses and are usually set near the curb. Check valves act against a backward flow of water and are useful on force mains to protect the meters against back pressure, while reducing valves are employed to relieve depressed areas of a city from excessive pressure where an effective division into high and low service is impracticable. They operate automatically, under the hydraulic pressure in the mains in which they are located, while the other forms are operated by hand or may be operated by electrical connections. Valves are expensive contrivances, and the cost of the larger sizes may be often reduced by the application of the Venturi principle, the larger pipes being gradually contracted to the size of a small valve, and then gradually increased to the original size without much loss of pressure.

Hydrants are valves used for fire-fighting and flushing purposes. In post or fire-hydrants, a vertical tube extends from the valve to a certain height above the ground. They are usually set on a branch pipe, at or near the curb line, and may be provided with from one to four nozzles, according to the capacity of the service mains, for the attachment of fire-hose. They are made in an innumerable variety of patterns; a first-class hydrant, however, consists of a frost case that is free to move up and down as the ground expands and contracts under varying temperatures, without straining the hydrant base; a waste valve that will drain the hydrant effectually as soon as the main valve is closed, and which will close automatically as soon as the main valve begins to open; a main valve that is positively tight, which if it closes "with" the pressure will be free of any slack motion of its stem and thus prevent a severe water-ram at the moment it is closed; a screw motion of the valves requiring at least ten complete revolutions before the valves are seated, thus insuring a slow closing and preventing the excessive shock and strain on the valves of an entire system that may result from a water-ram caused by the simultaneous closing of several hydrants. A stop-valve is usually placed between the main and the hydrant, so that the latter may be repaired without shutting off the flow through the mains. Hydrants should not be placed more than 500 feet apart, while in a closely built business district they may be placed at very close intervals.

Waste by leakage from the mains, and poorly constructed flushing devices, varies from 5 gallons upward per capita, and its reduction to a minimum is essential to the economical operation of any system of water-works, but it is especially important when the source of supply is distant and the purity of the water depends upon the conservation of its quantity. This can only be accomplished by careful workmanship in the construction of the plant; careful pipe laying; the use of high-grade, self-closing plumbing fixtures, especially those devices used for flushing water-closets, and the installation of meters not only to detect leaks and other causes of waste in the houses, but to form the basis for charges

WATER WORSHIP—WATERBURY

against the consumer and compel carefulness on his part. This, however, brings the matter to a point where it is necessary to harmonize good practice with public policy. The details of district meter systems, and the inspection of service pipes are minor problems as compared with the equitable adjustment of water rates according to the various classes of consumers. In general, although the district plan is but a poor competitor of the house meter system, it has produced good results in controlling waste and detecting leaks whenever it has been employed, and is worthy of more careful consideration, and extensive application in the various water-works systems throughout the United States.

Consulting Civil Engineer.

Water Worship, a feature of nature worship, and one of the primitive superstitions of mankind. Water was not worshipped as an element, but in its various forms of well and spring, river and ocean. Every spring and river was supposed to have an animating deity, who could be propitiated or offended, and the worship of these divinities was a prominent part of Greek and Roman cult, especially in the rural districts.

Waterboro, wá'tér-bûr-ô, Maine, town in York County; on the Portland & Rochester Railroad; about 25 miles southwest of Portland. It contains the villages of Waterboro, East Waterboro, South Waterboro, North Waterboro, Waterboro Centre, and Ossipee Mills. It was settled in 1767, and in 1789 was incorporated. The town has flour and lumber mills, an apiary for breeding bees, and considerable dairy interests. Pop. (1910) 997.

Waterbury, a city of Connecticut, in New Haven county, the fourth in population in the State, and one of the most important manufacturing centres in New England. It is situated on both sides of the Naugatuck River, 21 miles above its junction with the Housatonic, 22 miles northwest of New Haven and 32 southwest of Hartford. In January, 1902, by an amendment to the charter, the city became co-terminous with the town, so that it now covers an area seven or eight miles square. Its physical features are greatly diversified. Its streams and wet lands probably suggested its name, given to the town at the time of its incorporation. Its earliest designation, "Matetacoke" (shortened to Mattatuck), means a place or land without trees, and had reference probably to the primeval meadows on the Naugatuck.

History.—The first attempt at a settlement was made in 1674, by men of Farmington, on the high land west of the river, known ever since as

the Town Plot. The breaking out of King Philip's war led to the abandonment of this site, and the planters, when they returned, settled on the east side of the river, nearer to Farmington, calling the place the Town Spot. The settlement was formed under the order of the General Court, upon the payment of about £2,500. The men numbered 31, and for 26 years no outsider was admitted as a proprietor. Mattatuck was incorporated as a town (of Hartford county), with a change of the name to Waterbury, in 1686, occupying then a territory about eight miles wide and 18 miles from north to south.

For more than a century its growth was slow. In addition to the natural disadvantages of the situation, there were such disasters as the "great flood" of 1691 and the "great sickness" of 1712. The organization of a church—always an important event in a New England plantation—did not take place until 1691. The town and parish were identical until 1738, when Westbury (now Watertown) was set apart as an ecclesiastical society. Northbury (now Plymouth and Thomaston) secured similar rights in 1739, and thenceforth the original parish became known as the First Society. The church belonged, of course, to the Congregational denomination. No other existed in the territory until 1737, when Episcopal services were introduced. The town was represented in the Revolutionary War by about 800 men, an extraordinary number.

Throughout its history, Waterbury has suffered seriously from fires. The losses in 1880-81 and in 1892-94 were exceptionally large, but were far surpassed by those of the great fire of 1902, which amounted to more than \$2,000,000. A fire company was organized in 1828 and several others later, and a fire department was established under the first city charter in 1854. This has developed, much after the fashion of other cities, into a paid department, with a chief engineer, and equipped with a modern automobile apparatus.

Manufactures, etc.—The conditions that surrounded the settlement of the town and limited its agricultural prosperity became an important factor in its subsequent development. Under the discipline of poverty and hardship, a group of men grew up who possessed inventive genius, and, in addition, patience, economy, and pluck. When the manufacturing era opened, these men were at the front, ready to make use of their opportunities, while the rapid streams of the region furnished the necessary water-power. The farmers' sons became manufacturers—makers of clocks and buttons—and along the several streams little factories and mills grew up, whose products met the growing demand of the time. It was in response to this demand, emphasized by the War of 1812-15, that the brass industry of Waterbury received its early impetus—an impetus which was enhanced anew, and very greatly, by the war for the Union. By 1840 the manufacture of sheet metal and wire had taken the lead of all others. But there were many uses to which sheet brass could be applied beside button-making, and Waterbury manufacturers were quick to discover them. The great manufactories are still known locally as "rolling mills," but the articles produced in them are of endless variety. Through the latter half of the 19th century the bulk of the brass manufacture was carried on by six concerns, one of which came into existence in 1802, and an-

WATERBURY

other a few years later. These six manufacturing concerns still hold (in 1912) their prominent position, but meanwhile others have sprung up and attained to great importance, some devoted to one specialty and some to another, and several of them rivaling in the extent of their product the older establishments. Buttons, buckles, pins, hooks and eyes, suspenders, harness trimmings, rivets, wire, tubing, gas fixtures, lamps, brass kettles, boilers, clocks, watches, spoons, forks, flasks, percussion caps, photographic materials, coins for South American republics—things of all kinds made wholly or in part of brass—are sent forth from their packing rooms by hundreds of thousands, and shipped to all parts of the world. The chief seat of the brass industry in America is the Naugatuck Valley, and Waterbury is its dominant centre. There are also important establishments quite outside of the brass industry—machine shops of national reputation, foundries, manufactories of cutlery, of hinges, of traps, of aluminum goods, paper-box factories, and various others. The number of Waterbury concerns which organized under the "Joint Stock Law" of Connecticut between 1843 and 1911 was about 300. One hundred of these were companies working in metals; the rest were corporations manufacturing other materials, or mercantile and miscellaneous concerns. Many of these have ceased to exist, but the surviving corporations number 169. In 1845 the capital employed in manufactures amounted to \$653,825; in 1890, the amount of the capital was \$17,682,500, and the value of the product, \$17,712,820; and, in 1910, the amount of the capital was \$35,000,000, the value of the product \$50,350,000, and the total of wages paid \$12,000,000. Through all this period Waterbury men were busy as inventors. The first United States patent was granted to a descendant of a Waterbury miller; the second was granted to a resident of Waterbury—in 1796. The number of patents issued up to 1890, in proportion to the number of the inhabitants, was as 1 to 405, while the proportion of Connecticut patents to the population of the State was as 1 to 706. The city has seven banks, including four savings banks, also three trust companies.

Railroads and Transportation.—Electric cars run through the main streets and beyond the city limits in every direction to the neighboring towns. The headquarters of the western division of the New York, New Haven and Hartford Railroad are in Waterbury and express train service is given both to New York and Boston with local service on branches extending to Middletown, to New Haven and to Watertown. There are stage lines as of old, to Naugatuck, Middlebury, and Woodbury; also the usual local and national express companies, and the usual telegraph and telephone facilities and a messenger service. The product of the Waterbury manufacturers in the line of mailable goods is so immense that the business of the post-office is exceptionally large. The receipts for 1911 were \$169,231, exclusive of money orders. The money order business amounts to nearly a million dollars annually.

Water Supply, Lighting, Etc.—The water supply is abundant and good. A reservoir was established on East Mountain in 1868, another on Cooke street in 1880, the Wigwam Reservoir

in 1901, and in 1909 the building of the Morris Reservoir on the west branch of the Naugatuck, 11 miles north of the city, was begun. These reservoirs have a total capacity of 2,735,000,000 gallons of water. There are 83 miles of water pipe, and the daily average of water used in 1911 was 7,196,254 gallons. A sewerage system was introduced in 1883, but the discharge of sewage into the river was strongly objected to by persons and establishments located below the outfalls. In August 1904, the city began the building of a trunk sewer, and a sewage disposal plant some miles down the valley. The city has been lighted by gas since 1854. Electric lights were introduced in 1884, and were substituted for gas lights on the public streets not long after. Since 1904, the current which supplies the lights and also furnishes the motive power of the trolley system, is brought across the country from the Housatonic River.

Streets, Parks, Buildings, Etc.—The city is divided into four sections, as the town has been from its settlement, by two main streets, one running east and west, the other nearly north and south. There is also an informal division into districts, some of which represent the school districts of the earlier time. The most important of these are Brooklyn, Waterville, Hopeville and Bunker Hill. At the intersection of the main streets there is a central park or green, adorned with stately elms, at one end of which stands an elaborate soldiers' monument (erected in 1885, by popular subscription), and at the other end a handsome drinking fountain. The development of Hamilton and Chase Parks—valuable gifts to the city—was begun in 1903. The public buildings worthy of mention are the courthouse, the post-office, the Bronson Library, the Second Congregational Church, Saint John's Church (Episcopal), Saint Patrick's Church (Roman Catholic), the building of the Young Men's Christian Association, the Girls' Industrial School, the Lilley building, the Citizens' Bank, the Elton Hotel and the Buckingham building. Plans have been prepared for the erection of a fine new City Hall to take the place of the structure burnt in 1912.

Education, Etc.—School affairs were at first conducted by the town, and afterward by a "school society," which divided the town into fourteen districts. In 1849, chiefly with a view to establishing a high school (the old academy having suffered a decline), five of the districts were incorporated as a Centre district, under the management of a Board of Education, a Finance Committee and a Superintendent of Schools,—leaving a circle of outlying districts under the old management (a Board of School Visitors). In 1899 the bounds of the city were extended and made co-terminous with those of the Centre district, and the earlier and somewhat cumbrous organization was superseded by a Department of Education, consisting of the Mayor and a board of seven members. When, in 1902, the city was finally made co-terminous with the town, the traditional status of the outlying districts was preserved. The Superintendent of Schools reported in 1911: Children (enumerated), 20,347; enrolled in the public schools, 12,895; buildings, 30; school-rooms, 308; teachers, 347; expenditures for 1911, \$531,928.

WATERBURY — WATERCOURSES

Kindergartens, Domestic Science, Manual Training and Sewing Departments have been established in all of the schools, and the evening schools have been conducted since 1856. An open-air school was established in 1912. The first high-school building was destroyed by fire in 1870; the third was erected in 1895-1911 at a cost of \$225,000. Pupils enrolled in other than public schools in 1911 numbered 4,500. These other schools include Saint Margaret's School for Girls (the Diocesan School of the Episcopal Church), the Academy of the Convent of Notre Dame, five large parochial schools and various smaller schools. The Bronson Library, founded in 1868 by a bequest of \$200,000 from a native of the town, contains more than 86,000 volumes, and has a very wide circulation every month. The present building was erected in 1893-94, at a cost of \$63,500, and the fund now amounts to \$250,000. There are three daily newspapers—the *Waterbury American*, established in 1844; the *Waterbury Democrat*, and the *Waterbury Republican*, both dating from 1881. The town has made a very respectable record in pictorial art, sculpture, music, and literature.

Societies.—Various literary, musical, and scientific societies and social clubs have been organized, the most active of which are the Waterbury Club, incorporated in 1881; the Women's Club, established in 1889; the Daughters of the American Revolution (1893), the Naturalists' Club (1897), the Mattatuck Historical Society, organized in 1877 and incorporated in 1902, and the Country Club, incorporated in 1908. The various Masonic bodies and mutual benefit fraternities number more than 175. The National Guard of Connecticut is represented by Companies A and G of the Second Regiment, for whose use an armory was built in 1883. The Young Men's Christian Association, organized in 1858, occupies a building which cost \$40,000. Other philanthropic organizations are the Industrial School (for girls), the Boys' Club, the Young Women's Friendly League, two day nurseries, a free kindergarten, Protestant and Roman Catholic temperance societies, and the Southmayd Home (for aged persons). Waterbury has two large modern hospitals, the Waterbury Hospital and the St. Mary's Hospital, costing considerable over one-half a million dollars. The present almshouse was built in 1893, at a cost of \$80,000. Of the several cemeteries of the town, Riverside (opened in 1853) is noteworthy for its picturesqueness and for its monuments. A memorial chapel stands at its main entrance.

Religion.—Waterbury contains 35 churches and three Union chapels. Probably two-thirds of the population are Roman Catholics, and the Catholic churches number 10. Five of the Protestant churches are Congregational, three Episcopalian, four Baptist, five Methodist, three Lutheran, and one Adventist. There is also a corps of the Salvation Army, a society of Christian Scientists, and two Jewish synagogues.

Government.—In 1825 the population lying around the centre of the town was organized into a borough. The incorporation of the city took place in 1853, with a population of about 4,000. A new charter, obtained in 1871, was superseded by another in 1896, to which important amendments were made in 1899 and 1902. Under

this third charter the city is divided into five wards, and the government is conducted by a mayor and 15 aldermen, through a number of boards, each having charge of one of the following departments: Of Public Works, of Public Safety, including the police and fire departments, of Public Health, of Charities, of Education, of Finance; also a Board of Assessors, a Board of Relief, and a Board of Agents of the Bronson Library. There are also superintendents of streets, of the water works and of sewers, and a city engineer. Besides the Police Court, there is a District Court, which has jurisdiction beyond the limits of the city, and sessions of the Superior Court are held in Waterbury.

Population.—The successful conduct of manufactures so extensive and varied in an inland Connecticut valley has involved a large and steadily increasing immigration. The growth of the city since 1850 has been greatly augmented by the steady inflow of foreigners. The population in 1790 numbered 2,937, in 1850, 5,137; in 1860, 10,004; in 1880, 17,806; in 1890, 28,646, in 1900, 51,139. The U. S. census of 1910 reported the population at 73,141, the per cent. of increase being 59.5. The percentage of residents of foreign birth or parentage is, with one exception, the largest of any Connecticut town, and the number of nationalities represented is remarkable. At the same time, the condition of the community, socially and morally, is exceptionally good. Waterbury is noted for the superior grade of the homes of its working people. Strikes have occurred very rarely—never in the large manufactories—and, although the saloons number 175, there is but little intemperance or other visible crime. Wealth is more uniformly distributed than in most cities, the question frequently arising whether there are any millionaires in the community. The valuation of property, real and personal, in 1911 was \$66,385,300.

Bibliography.—Bronson, 'History of Waterbury' (1858); Bassett, 'Waterbury and Her Industries' (1888); Anderson, 'The Town and City of Waterbury from the Aboriginal Period to the Year 1895' (1896); also 'Charter and Ordinances of the City of Waterbury' (1902), and the annual 'Municipal Register.'

JOSEPH ANDERSON.

Waterbury, Vt. town in Washington County; on the Waterbury River, and on the Central Vermont Railroad; about 11 miles northwest of Montpelier. It contains the villages of Waterbury and Waterbury Center. The location, in a beautiful valley, is most picturesque. The principal manufacturing establishments are grist and lumber mills, brick works, tannery, boot and shoe factory, sleigh and carriage works. There are six churches, Green Mountain Seminary, and graded schools. Pop. (1910) 3,273.

Watercourses, in law, streams of water usually following a well-defined channel and emptying into some other body of water. A watercourse need not maintain a constant current, but it must be more than an occasional stream, the result of unusual rains or the melting of snow, and following a channel customarily dry. See **RIPARIAN RIGHTS**; **WATER RIGHTS**.

WATEREE — WATERLAND

Wateres, a river of South Carolina, formed by the junction of the Catawba River and Fishing Creek, and is called the Catawba in the upper part of its course. It runs nearly southward, forms the east boundary of Chester, Fairfield, and Richland counties, and unites with the Congaree River at the southwest extremity of Sumter County to form the Santee River.

Waterfall, a sudden descent in the water of a river or stream from a higher to a lower level. When the water falls over a precipice it is called a cataract, and when several cataracts occur in succession it is called a cascade. Some of the mountain waterfalls are remarkable for their height, while others are noted for the fall of immense quantities of water. The most remarkable waterfall in the world is Niagara Falls on the Niagara River, between Lakes Erie and Ontario, and thousands of visitors from all parts of the world have admired the sublimity of these falls. Waterfalls are now being utilized to furnish both electric and water power for commercial purposes. The falls discovered by Dr. Livingston in Africa and named by him Victoria Falls, the falls of the Rjukanfoss in Norway, the Cascade of Gavarnie in the Pyrenees, and the falls of the Rhine are among the most beautiful in the world, and justly celebrated. For a fuller description see CATARACTS.

Waterford, Ireland, a maritime county in the province of Munster, bounded on the north by Counties Tipperary and Kilkenny, on the east by County Wexford, on the west by County Cork, and on the south by the Atlantic. It has an area of 717 square miles. The coast is bold and rocky, but has several good harbors. The surface is generally mountainous and there are many marshes. Agriculture is carried on to a limited extent only. In 1901 the total extent of lands under crops was 53,745 acres, including meadow and clover, 78,373 acres. Bacon and butter are the chief exports. There are some minerals in the county, but little is done in the way of mining. Some limestone and marble are quarried. The fisheries on the coast give employment to several hundred men. The chief towns in the county are Waterford, Dungroven, and Tramore. The county is divided into two parliamentary divisions, East and West, and had a population of about 90,000.

Waterford, Ireland, capital of County Waterford, and a county city, on the right bank of the Suir, connected with its north suburb of Ferrybank, by a bridge. Of six Catholic places of worship, including a cathedral, the finest is the Dominican Church of Saint Savior, erected (1878) in the Italian style, the Protestant Episcopalians have also a cathedral and two churches. Other buildings are the Protestant Episcopal palace, the Catholic College of Saint John, Saint Dominic's Industrial School, four convents, a town hall, market house, etc. Considerable sums have been expended in deepening the channel of the Suir, whose south bank is fringed for a mile by a spacious quay, while on the Kilkenny side is a shipbuilding yard, with a patent slip, graving bank, and dock. Besides two immense bacon-curing establishments, Waterford has iron foundries, flour mills, breweries, etc. A memorial of Waterford's foundation by the Danes in the 9th century is "Reginald's Tower" (1003), which has witnessed the city's capture by Strongbow (1170), the repulse of Cromwell and surrender of Ireton (1640-50),

and the embarkation of James II. after the battle of the Boyne (1690).

Waterford, N. Y., village in Saratoga County; on the Hudson River at the mouth of the Mohawk River, and on the Champlain Canal and the Delaware & Hudson Railroad; 2 miles above Cohoes and 10 miles north of Albany. It has extensive water-power, and is a manufacturing village. The chief manufactures are knitting mills, foundry and machine shops, fire-engine shops, paper and flour mills, boiler works, and a furniture factory. In 1900 (government census) there were 58 manufacturing establishments, capitalized for \$2,593,021. The raw material used annually cost \$1,544,719, and the value of the finished products was \$2,066,060. It has a Union Free School, public and parish elementary schools, free library, and one private bank. Pop. (1910) 3,245.

Waterhouse, Alfred, English architect: b. Liverpool 19 July 1830; d. London 22 Aug. 1905. He studied architecture under Richard Lane in Manchester, and afterward in France and Italy. He began practice in Manchester in 1853, and first made his name known by the Assize Courts of that city. For the same city he afterwards designed the County Jail, Owens College, the Town Hall, Saint Mary's Hospital, and other buildings. In other parts of England he was responsible for the following among other buildings: in Liverpool, Seaman's Orphanage, Turner Memorial Home, Royal Infirmary, and University College; in London, Natural History Museum, New Saint Paul's School, City and Guilds Central Institution, King's Weigh House Chapel, and University College Hospital; in Oxford, Balliol College (partly rebuilt); in Cambridge, Caius and Pembroke colleges (partly rebuilt); in Leeds, Yorkshire College; the mansions of Eaton Hall (Cheshire), Heythrop (Oxford), and Iwerne Minster (Dorset). He was elected A.R.A. in 1878, and R.A. in 1885, and in 1898 became treasurer of the Academy. He received a Grand Prix from the Paris exhibition of 1867, and was a member of various foreign academies. In 1878 he was awarded the gold medal of the Royal Institute of British Architects, of which he was president 1888-90.

Waterhouse, John William, English painter: b. Rome, Italy, 1840. He studied at the Royal Academy and his paintings are noted for the richness of their coloring. His paintings include: 'The Oracle' (1884); 'The Magic Circle,' 'The Lady of Shalott,' and 'La Belle Dame sans Merci.'

Waterland, Daniel, English clergyman: b. Lincolnshire 14 Feb. 1681; d. 23 Dec. 1740. He studied at Cambridge, became master of Magdalen College, chaplain to George I., and canon of Windsor. Waterland was an able defender of the Orthodox faith against the Deists. His chief writings are: 'A Vindication of Christ's Divinity, being a Defence of some Queries relating to Dr. Clarke's Scheme of the Holy Trinity' (1719), followed by a second (1721) and third (1725) 'Vindication'; a 'Critical History of the Athanasian Creed' (1724), also directed against Clarke; 'Christianity Vindicated Against Infidelity,' a reply to Tindal's 'Christianity as old as the Creation'; and a 'Review of the Doctrine of the Eucharist' (1737), directed against Hoadley's rationalistic theory of that ordinance. Consult: Van Mildert, 'Life of Daniel Waterland'

WATERLINE — WATERLOO

prefixed to Waterland's 'Works,' in 6 vols. (1843).

Waterline, in shipbuilding, the boundary of any section of the bottom of a ship made by a plane parallel to the line of flotation. The uppermost one is called the load water line; the lowest the light water line.

Waterloo, Stanley, American author and journalist: b. Saint Clair County, Mich., 21 May 1846. He was graduated from the University of Michigan in 1869, engaged in journalism, was one of the owners of the *Saint Louis Journal* in 1872, was subsequently editor of the *Saint Louis Republic*, *Chronicle*, and *Globe-Democrat*, and in 1884 established the *Saint Paul Day*. He was later editor-in-chief of the *Chicago Mail*, and has been engaged on various other journals. He has written: 'A Man and a Woman' (1892); 'Honest Money' (1895); 'These are My Jewels' (1902), etc.

Waterloo, Canada, (1) A town of Waterloo County, Ontario, two miles northwest of the capital, Berlin, on a tributary of the Grand River, and on a branch line of the Grand Trunk Railway to Elmira. It is an industrial centre, with iron foundries, manufactures of agricultural implements, textiles and tobacco, breweries, and distilleries. Pop. (1901) 3,537. (2) The capital of Shefford County, Quebec, and a railway junction, on the Stanstead, Shefford & Chambly Railway, 70 miles east by south of Montreal. It has lumber and flour mills, a brewery, tanneries, and manufactures of mill-machinery, agricultural implements, iron castings, and furniture. Pop. about 2,000.

Waterloo, England, a town and watering-place of England, on the Lancashire coast, four miles north-northwest of Liverpool, forming with Seaforth one urban district. Pop. about 25,000.

Waterloo, Ill., city, county-seat of Monroe County; on the Mobile & Ohio Railroad; about 20 miles south of Saint Louis, Mo. It is in a fertile agricultural region, in which the chief products are wheat and corn. In the vicinity are quarries of fine building stone, known in the trade as Waterloo marble. The chief manufacturing establishments are flour mills, marble works, a large brewery, an ice factory, and bottling works. There are large stock yards and coal and lumber yards. The educational institutions are a high school, founded in 1891, Saint Joseph's School (R. C.), public and parish elementary schools, and a school library. The two banks have a combined capital of \$35,000, and deposits amounting to \$253,930. Pop. (1910) 2,091.

Waterloo, Ind., town in De Kalb County; on the Cedar Creek, and on the Lake Shore & Michigan Southern Railroad; about 25 miles north of Fort Wayne. It is the commercial centre of an extensive agricultural section, in which wheat, corn, and vegetables are the chief products. It has seven churches, a high school, founded in 1872, graded elementary schools, and two banks. It was founded in 1857, and in 1864 was incorporated. Pop. (1910) 1,167.

Waterloo, Iowa, city, county-seat of Blackhawk County; on the Cedar River, and on the Illinois Central, the Chicago, Rock Island & Pacific, and the Chicago, Great Western R.R.'s; about 95 miles west of Dubuque. It is in an ag-

ricultural and stock-raising region, and has considerable manufacturing interests. The chief manufacturing establishments are foundries, machine shops, gas-engine works, thrashing-machine factories, and automobile works, and manufactories of refrigerators, manure spreader, and egg cases. The government census of 1900 gives the number of manufacturing establishments as 147, which were capitalized for \$1,287,056. There were employed as wage earners 1,042, to whom were paid \$471,608. The raw material used cost \$1,555,578, and the annual products were valued at \$2,499,361. The manufacturing industries had increased from 1900 to 1903, so that in December of the latter year there were 2,726 employees. The principal public buildings are the government building, the county court-house, municipal buildings, and the Presbyterian Hospital. There are 31 church buildings. The educational institutions are two public high schools; the East High School, founded in 1872, and the West High School, in 1870; Our Lady of Victory Academy (R. C.), public and parish elementary schools, Waterloo Business College, and school libraries. The seven banks have a combined capital of \$4,188,103 (December 1903). The government is vested in a mayor and a council of eight members elected biennially. The majority of the inhabitants are American born; of the foreign born the Germans predominate, then the Irish, and the Scandinavians. Waterloo was settled in 1845-6 by G. W. Hanna and Charles Mullan. It was incorporated as a town in 1868. Pop. (1890) 6,674; (1900) 12,580; (1910) 26,693, an increase of 112 per cent.

J. C. HARTMAN,
Editor 'Courier.'

Waterloo, N. Y., village, one of the county-seats of Seneca County; on the Seneca River, the Cayuga & Seneca Canal, and on the New York Central & Hudson River Railroad; about 18 miles west of Auburn and 55 miles east of Rochester. It is in an agricultural region, but the village has several manufactories, chief of which are large woolen mills, lumber mills, piano factories, wagon and carriage works. It has a high school founded in 1843, public elementary schools, and a public library. The two banks have a capital of \$125,000, and deposits amounting to \$434,270. Pop. (1910) 3,931.

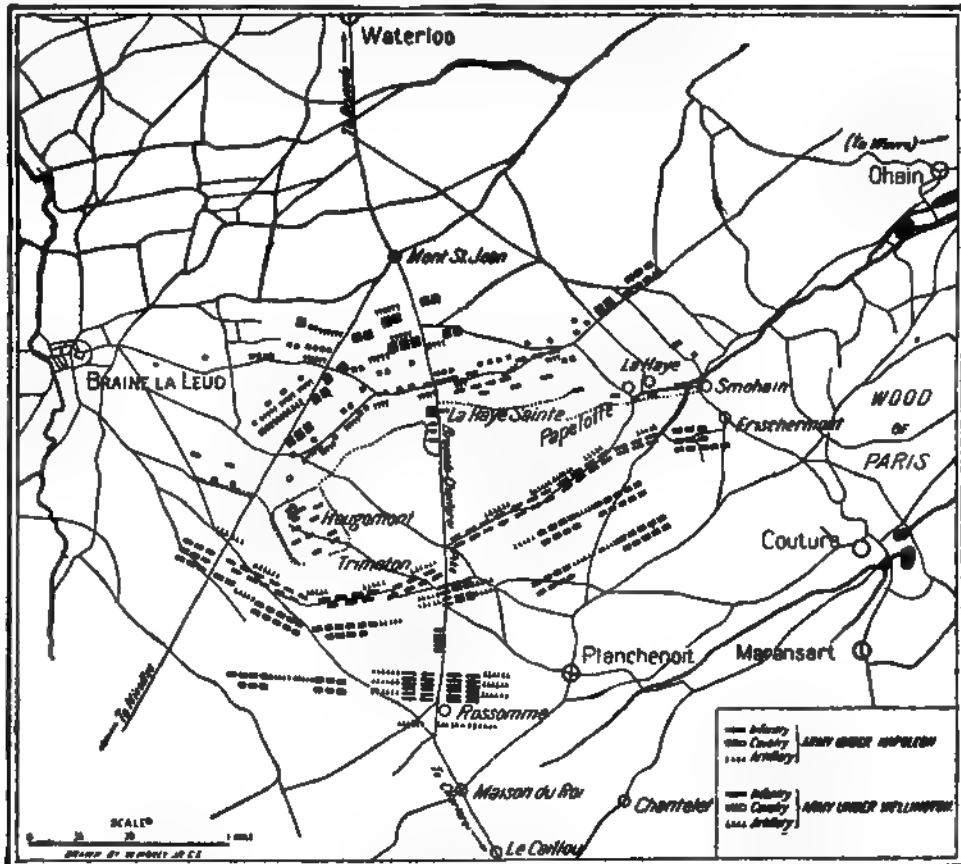

Waterloo, Battle of, the culminating engagement of the shortest and most decisive of all of the Napoleonic campaigns, was fought 18 June 1815, near the village of Waterloo, in Belgium, situated about 12 miles south of Brussels. From 11 April 1814, when Napoleon signed the first abdication and retired in exile to Elba, until 20 March, when he terminated the period of that retirement and returned to Paris, the political and domestic affairs of France had been bordering on revolution. Although the administration of affairs by the government established by the Comte du Provence, who, under the title of Louis XVIII., had taken unopposed possession of the country, restored political liberty, the changes inaugurated were so sudden, that it unsettled all domestic affairs, the title of estates, the position of public men, and the prospects of the army to an intolerable extent. A general sense of alarm and humiliation prevailed among all classes, and even a Napoleonic period seemed preferable to the existing conditions. To add to the general turmoil, about 300,000 troops who

WATERLOO

had been held as prisoners in the various German fortresses were released under treaty stipulations and returned to France. Their apparent availability for further operations soon formed the basis for innumerable military plots of which that designed by Fouché, with the ultimate object of placing either the Duke of Orleans or the King of Rome upon the throne, was the most important.

Napoleon was fully conscious of the existing state of affairs. France was down, groveling at the feet of the Allies. Here was the opportunity for a truly patriotic action. He would give popular liberty to imperial France, and

dred Days with professions of peace and liberty, the Allied Powers suspended negotiations at the Congress at Vienna, issued a declaration branding him as "an enemy and disturber of the peace of the world," and formed a new Coalition to renew the struggle against him. By the beginning of June they had more than 700,000 men in the field, and he was compelled to take active measures to defend his newly recovered empire. The French army amounted to about 500,000 men, on paper, but only about 200,000 men were available for actual field service. In planning the campaign, Napoleon had the choice of confining himself to purely defensive operations and

Field of Waterloo. (Showing positions of the two armies at 11 a. m., 18 June 1815.)

henceforth devote all his energies to strengthen that liberty and increase that prosperity. He counted upon the enthusiastic support of the army which was fretting under the command of emigres who had once fought against France, but were then being appointed to important commands, and felt sure of the effect of his tremendous military fame upon the general military feeling of the country. He thought of Marengo; how in three short months he had lifted France and himself from the lowest ebb of fortune up to the highest pinnacle of military glory and power. He judged correctly in all these things. He left Elba 20 February, and landed on the coast of France 1 March, and entered Paris triumphantly 20 days later.

While Napoleon was inaugurating the Hun-

allow the Allies to invade France, or of assuming the offensive, and relieve her of the consequences of a second invasion. He chose the latter, and laid the scene of the campaign in Belgium where the English under the Duke of Wellington had their headquarters at Brussels, and the Prussians under the command of Marshal Blücher, at Namur.

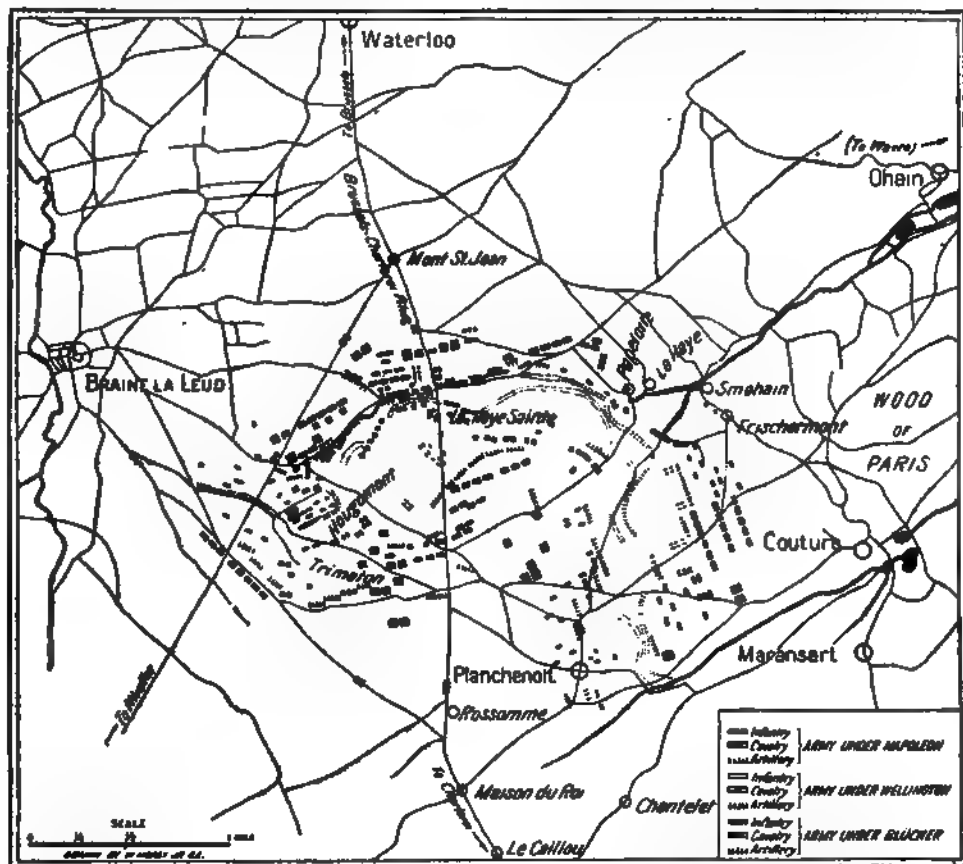

The general plan of operations was based upon his favorite form of strategy—action on "interior lines" against the two armies opposed to him. He assumed that Wellington and Blücher would endeavor to form a junction at Charleroi, and determined to concentrate the bulk of his own army at that point and defeat them separately before they could effect that junction, and then turn his attention to the force

WATERLOO

of Austrians and Russians gathering on the eastern border under the command of Prince Schwarzenberg.

At the beginning of the campaign the French army numbered 124,588 men—89,415 infantry, 23,595 cavalry, 11,578 artillery with 344 guns. Wellington commanded 93,717 men—69,829 infantry, 11,879 cavalry, 9,406 artillery and engineers, with 196 guns. The Prussian forces under Blücher amounted to 120,954 men—99,715 infantry, 11,897 cavalry, and 9,360 artillery, with 312 guns. Wellington's forces, composed of Englishmen, Dutch, Belgians, Nassauers, Germans, and Brunswickers, were stationed in numerous cantonments scattered over a large area

noon of the 16th, and after several hours of hard fighting were driven back upon Frasnes. In the meantime, with the intention of blocking the road between Quatre-Bras and Sombreffe so as to separate the forces under Wellington and Blücher, the troops commanded by Napoleon himself, attacked the Prussians at Ligny, and after three hours of severe fighting, defeated them and captured 21 guns. The battle was desperate and bloody; about 12,000 Prussians fell, and in the final charge of the Guard, Blücher himself was wounded. This was Napoleon's last victory. As the result of the battle, he assumed that the Prussians had been routed and were retreating to their base by way of

Field of Waterloo. (Showing positions of the three armies at 7:30 p. m., 18 June 1815.)

around Brussels, and to the westward of the Brussels-Charleroi pike leading to the south, with the coast as their base. Of Blücher's force, the First corps, under Ziethen, was at Charleroi, the Second, under Pirch, at Namur, the Third, under Thielmann, at Ciney, and the Fourth, under Bulow, at Liège, with the Rhine as their base.

The movement began on 13 June. The French army advanced rapidly northward, crossed the Sambre on the afternoon of the 15th, attacked Ziethen's position, drove him back upon Fleurus, and occupied Charleroi. A portion of the army then continued the advance through Gossillies to Quatre-Bras where they met a force of 25,000 men under Wellington, on the after-

Namur and Liège, when, as a matter of fact, under the direction of Gneisenau, Blücher's chief of staff, they were moving northward and converging on Wavre, with the intention of joining Wellington, with whom they were in constant communication. About noon of the 17th, Napoleon detached Grouchy with 33,000 men to pursue and complete the defeat of the Prussians driven back at Ligny, while he himself with the main body of the army joined Ney and followed Wellington, who, although victorious at Quatre-Bras, had been forced to fall back northward toward Brussels on account of the defeat of the Prussians at Ligny. Wellington's retrograde movement was continued during the whole of the 17th, until he had reached the heights of Mont

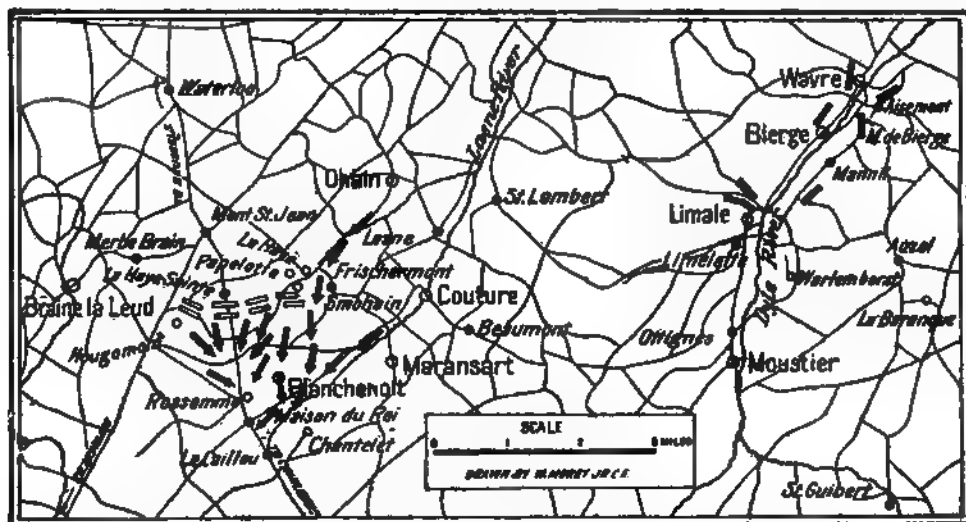

WATERLOO

Saint Jean, about four miles south of the village of Waterloo, where the Prussians could join him by way of Ohain and Wavre. Here he selected his position, and confident of their assured support, he awaited the advance of the emperor.

On the afternoon of the 17th, when Napoleon reached Marbain, he received the information that the Prussians defeated at Ligny had not retreated to Namur and Liège, and he sent a message to Grouchy informing him of that fact, and instructing him to find out if the Prussians were moving to a junction with Wellington. When Grouchy received this message he was actually farther from the Prussians than the Prussians were from Wellington, and about the time he reached Gembloux, about 10 o'clock on the night of the 17th, only to learn that the Prussians had really marched to Wavre, the main French army had reached the field of Waterloo and bivouacked opposite the forces of Wellington. It was past midnight when Napoleon inspected the position of both armies. The main

on the Charleroi pike directly in the rear of Wellington's position and thus cut off his retreat in the direction of Brussels and his base of supplies. The best authorities concede that the plan was admirably conceived.

About 8 o'clock on the morning of the 18th, Wellington drew up his forces in line of battle, but although the rain which had been falling all night ceased about that time, the attack by the French was postponed so that the ground might be in better condition for artillery movements. A little before 9 o'clock Napoleon reviewed his lines, and about 10 o'clock he sent instructions to Grouchy to advance upon the Prussians at Wavre. The battle commenced at 11.30. As a diversion, a division of Reille's corps assaulted the British position at Hougomont, were repulsed, and were supported by division after division until the entire Second corps were in action against Wellington's left, and therefore did not take any part in the main attack on the British centre by D'Erlon about 1.30. In this attack, the advanced troops of the British right,

General Map. (Showing positions of the three armies at 8 p. m., 18 June 1815.)

line of Wellington's forces occupied an advantageous position along the highway that runs from Braine la Leud to Wavre by way of Ohain, with the centre resting on the Brussels-Charleroi pike, while strong outposts held the farm house of La Haye Sainte directly in advance of the centre, the hamlets of La Haye, Papellotte, and Smohain on the extreme left, and the chateau of Hougomont on the right. His force consisted of 67,661 men—49,608 infantry, 12,408 cavalry, and 5,645 artillery with 156 guns. Of these the British troops numbered only about 24,000. Napoleon had 71,947 men—48,950 infantry, 15,765 cavalry, and 7,232 artillery with 246 guns. He arranged his troops in two lines diagonally across the Brussels-Charleroi pike, the right resting on Frischermont, and the left across the road to Nivelles, with a strong force of infantry, cavalry, and artillery stationed in the rear on both sides of the Charleroi pike near Rosomme.

Early on the morning of the 18th, he dictated his plan of battle the direct object of which was to capture the village of Mont Saint Jean lying

composed of Bylandt's brigade, were easily routed, but the advancing French received a terrific fire from Picton's brigade, and being charged by the British cavalry, fell back in great disorder. Here General Picton who probably commanded the British right was killed. In the meantime, assault upon assault was made by the French on La Haye Sainte, which occupied the greater part of the afternoon, while for two hours, from 4 to 6 o'clock, under the personal direction of Ney, the splendid cavalry divisions of the French were hurled against the British right-centre, but failed to break the formation of a single British square. The cavalry attack being unsupported by infantry, Ney was compelled to withdraw for lack of troops, about 6.30, just as La Haye Sainte was taken, too late, however, to be of any advantage. About the middle of the afternoon Napoleon discovered the advance guard of the re-enforcing Prussians on the hills of Saint Lambert about three miles away upon his right, and realized for the first time that the entire Prussian force had succeeded in concentrating at Wavre, and were now on hand

to aid Wellington. He immediately detached Lobau with the Sixth corps, to intercept the new enemy, and sent a message to Grouchy, ordering him to return. Grouchy in the meantime, having moved off to Wavre in search of the Prussians, did not get this message until evening.

Lobau being unable to check the advance of the Prussians, the Young Guard was sent to reinforce him, and then, believing that his right was secure, Napoleon massed the eight remaining battalions of the Imperial Guard for a final attack upon Wellington's centre. Supported by a terrific artillery fire, and led by Friant, the Guard advanced, while D'Erlon hurled the First corps against the British right. D'Erlon's assault was effective, but the Guard decimated by a heavy fire from Maitland's brigade, supported by those of Halkett and Elphinstone, were repulsed with terrific loss and fell back in complete disorder before the impetuous charge of the Fifty-second Regiment. Just then, about 7.30, the main body of the Prussians arrived, and going right into action, attacked the French right and threw it into confusion. At that moment, Wellington seeing that victory was assured, ordered a general advance of his lines and decided the contest. His troops, however, were too far gone to engage in the pursuit, which was taken up by the Prussians with vigor, and the retreat soon became a rout. Napoleon left the field in the centre of a square of the Imperial Guard. He left this at Genappe, and arrived at Charleroi at daybreak with a small escort of horsemen. He reached Paris 21 June, and signed the second abdication on the 22d. The entire campaign had lasted but three days, and the battle itself, one of the most remarkable and terrible of modern times, was decided in eight and a half hours. The French lost in killed, wounded, and missing, about 31,000 men, and the Allies, about 23,000.

Bibliography.—The literature upon the subject is very extensive, but for the most reliable and exhaustive information consult: 'The Campaign of Waterloo,' J. C. Ropes, New York 1892; 'Waterloo Lectures,' Chesney, London, 1874, and 'Quatre-Bras, Ligny, and Waterloo,' Gardner, London 1882.

Waterman, Nixon, American author: b. Newark, Ill., 12 Nov. 1859. He was connected with the *Omaha World-Herald* and *Bee* 1887-90; with the *Chicago Herald* and *Post* 1890-3, and since 1895 has been engaged in literary work. He is the author of 'A Book of Verses' (1900); 'In Merry Mood: a Book of Cheerful Rhymes' (1902); 'The Whistling Girl,' a comedy (1902); 'Cap and Bells' (1903).

Watermelon. See **MELONS.**

Waterproofing, the art of rendering various substances impervious to the penetrating action of water. The purposes to which waterproofing is now applied are very numerous and the methods range from the early use of lead for building foundations, of tar for tarpaulin, oil for oil-skin, rubber for clothing, to various painting processes which claim for bases, substances capable of resisting the natural action of the elements, and which, invisible, impenetrable, insoluble, and imperishable, effectually render brick, stone, marble, terracotta, stucco, concrete, etc., impermeable to water. These proc-

esses are used to waterproof and insulate exterior and interior walls of buildings, for cold storage plants, for the lining of reservoirs, for monuments, etc.

Among the numerous methods of waterproofing, many of which are protected by patents, the greater number in general relate to a surface application of some composition, usually somewhat thicker than an ordinary liquid solution. The more widely known methods of waterproofing are those used in connection with textile fabrics, cloth, with cordage, leather, etc. Water-repellent materials may be divided into two classes according to their nature, first, the coarser tissues used for awnings, tents, oil-skins, tarpaulins, or canvas coverings for exposed merchandise, etc.; secondly, the finer tissues employed for the manufacture of waterproof clothing. The earliest process consisted in covering the tissue with tar, a method still employed for marine supplies, ropes, cordage, and coverings, and which has the advantage of giving solidity to the fibre, and at the same time preserving it. Drying oils, and particularly boiled flax-seed oil are still largely used to waterproof coarse tissues, and particularly for the oilskin overalls worn in rough weather by sailors. Oiled tissues, however, are heavy and lack comfortable suppleness, while their color and appearance militate against their extended use. One of the more widely employed processes for waterproofing the coarser tissues consists in impregnating the material with an insoluble soap such as those formed with copper, iron, zinc, and alumina. Copper soap is most universally used. The material to waterproof is first passed through a 20 per cent soap bath, then immersed in an eight per cent solution of sulphate of copper. According to its nature, the fibre absorbs a certain quantity, large or small, of copper soap. In the ashes produced by the burning of a square yard of canvas or linen tissue so treated, as much as 57½ grammes of copper is found, and nearly 29 grammes of copper is to be found in the cinders of the same quantity of cotton tissue. Copper-soap waterproofed materials present a characteristic greenish tint.

The manufacture of waterproofed materials for clothing has attained considerable importance. The fact, however, must be recognized that the results generally obtained are not altogether satisfactory, especially from a hygienic point of view. Absolute waterproofing cannot be obtained without wholly closing the pores of the tissue; thus prepared it is an efficacious protection from rain and from contact with water, in certain cases is of real service, but inconveniently prevents ventilation. While the garments are made watertight they are at the same time made airtight. The perspiration and natural moisture of the body are not allowed to escape, but are held in saturation in the clothing, rendering it impure, damp, and uncomfortable. The body is kept damp, and upon removing the outer garments the wearer is liable to chills and colds, hence, such waterproofing is unsuitable for prolonged personal wear.

The most diverse substances can be used for waterproofing textiles, if they are soluble in a liquid other than water, and can be spread over the surface of the material,—if they possess a certain suppleness, and neither alter the fibre

WATERPROOFING

nor the color of the tissue. Wax, balsamic gums, isinglass, spermaceti, metallic soaps dissolved in essential oils, a solution of shellac with borax are employed in waterproofing tissues. The cloth, whether of silk, cotton, flax, or wool, is usually rendered waterproof by the application of some solution of any of these substances to one or both surfaces. In many of the earlier processes, the cloth was immersed in a liquid, so as to become saturated with the waterproofing agent. An early patent was obtained for a method of rendering cloth waterproof without concealing its textile surface; the cloth in the first place is saturated with a waterproof composition; it is then dried on one side to form a hard film, while the other side is kept moist, and is afterward deprived of its composition by means of spirits of turpentine.

Frequently silk tissues are waterproofed by the use of gelatine rendered insoluble by an alumina soap. The material is impregnated by passing it through cylinders covered with swan-skin, afterward being steam dried. Woolen tissues are passed through a solution of acetate of alumina obtained by treating ordinary alum with acetate of pyrolignite of lead. A well recommended formula is to be found in the following solution: gelatine, half a pound; soap, half a pound; alum, three-quarters of a pound; water, 17 quarts; after 15 minutes boiling, the tissue is wrung out, dried and pressed.

Absolute waterproofing of textile materials is obtained by applying to their surface a thin layer of rubber. The first experiments were made in France by Besson in 1793; they were improved upon and perfected successively by Mackintosh and Hancock of Glasgow, Scotland, by Buttler and Guibal in France, and by Goodyear in the United States. As in the case of Macadam with road surfaces, the successful efforts of Mackintosh perpetuated his name in connection with india rubber waterproof garments. The material is prepared by spreading on the surface a semi-liquid layer of rubber dissolved in benzol, then submitting it to the action of heat to evaporate the solvent. Sulfuretted carbon, first employed to dissolve the rubber, was replaced by a mixture of benzol or coal naphtha and essence of turpentine, and later by benzol which alone is now used. In the treatment of cotton and linen cloth a small proportion of sulphur is generally added. A thin layer of this rubber solution is spread on the fabric by special machinery, after which the cloth is doubled, pressed and finished in calendars, the waterproof layer being thus in the centre of the finished material. (See RUBBER MANUFACTURES.) The offensive odor of waterproofed rubber garments may be remedied by treating them with aromatized vapors, or by dipping them in concentrated infusions of vervain root, of orris root, of lavender, of camomile, etc. Ammoniacal vapor and sulphurous acid can also be successfully utilized to relieve rubbered materials of their penetrating odor. The application of rubber is made on dyed material in thread or in piece. The use of paraffine as an impervious agent allows the tissue to be dyed after being waterproofed. Paraffined tissues are not soaked by water, which assumes a spheroidal shape and slides off the surface. Woolen tissues well cleaned by passing through a light and tepid bath of carbonate of soda and

soap, are dried, then steeped in a solution of paraffine, or petroleum ether, 60 to 100 grammes to the quart. They are afterward passed through roller pressers, dried in the open air, and sent to the dyeing vats.

As already pointed out, waterproof rubbered textiles are not only impervious to water, but also to air, and numerous other methods and processes have been introduced to produce fabrics which, while resisting rain, do not altogether obstruct ventilation. The consecutive dipping of cloths, as already explained, in soap and alum solutions, or in gelatine and gall solutions, or in a solution of acetate of lead and then in a solution of alumina, are resorted to with more or less success. Algin, obtained from seaweed, has been strongly recommended for the same purpose. Acetate of alumina, decomposed by heat, leaves an insoluble gummy residue of hydrated alumina, and has been utilized for waterproofing tissues. Material so treated, like the paraffined tissues, is not moistened by water, which assumes a spheroidal shape and rolls from its surface; the material also has the advantage of a certain amount of ventilation. The fibre is, in a certain manner, impregnated with alumina, but the intervals between the threads exist. Nevertheless, if the material is insufficiently stretched or submitted to repeated rubbings, water will pass through, so that the process is not perfect. Owing to these causes this waterproofing process was abandoned for the cloth employed in the manufacture of the uniforms of the French army. One of the most modern processes consists in treating the fibres in the solution before being manufactured into textiles, and the fabric thus produced, while rain-resisting, offers the same ventilation as ordinary materials. Fibre-mail, as it is called, is described as a clear, colorless substance held in solution for the purpose of treating silks, woolsens, cottons, feathers, paper, and other materials, so as to render them water-repellent and proof against dampness, mildew, and moths. The value of the process is further stated to be by no means limited to the water-repellent qualities given to the goods treated. The application of the solution leaves a coating upon each separate fibre which, by the action of heat, is cured or vulcanized upon and into the fibre, strengthening it and leaving it impervious and elastic. Among other advantages cited are the properties of giving weight and body to the finer textile fabrics, and by this means, where desirable, economizing material, the quality of the goods being greatly improved and never deteriorated; the process also gives luster and finish to fabrics, being especially valuable for silks, alpacas, etc.; gives elasticity and toughness to the fibres, preventing cracking and breaking, qualities valuable for felt hats, silks, etc.; deepens and fastens the colors in dyed goods; resists stains and spots in the lighter and more delicate goods; prevents woods from swelling and warping; preserves painted surfaces; and prevents polished or metal surfaces from rusting.

Fibre-mail is also successfully applied to leather and leather goods. Many compositions, some of them patented, have been long employed, for rendering leather waterproof by filling up the minute pores. Four or five may be briefly described as examples of the whole.

Boiled flax-seed oil, mutton-suet, yellow beeswax, and common resin are melted over a slow fire, and applied while hot to the leather, which is itself to be made slightly warm. Linseed oil, resin, white vitriol, spirit of turpentine, and white oak sawdust are the materials of another composition. Yellow beeswax, Burgundy pitch, turpentine, and linseed oil constitute a third. A fourth plan consists in applying to the leather a hot mixture of two parts tallow with one part resin. Another is to apply a coating of tallow to the leather and a second coating of one part copaiba balsam with two of naphtha. Caoutchouc, boiled for two hours in linseed or neat's-foot oil is mentioned as a final formula.

Paint and silica compounds, oils, varnishes, and gums, have long been experimented with for the preservation of buildings by waterproofing. Coating buildings with linseed oil has been a favorite method as affording some degree of protection against the deteriorating action of the elements. But linseed or flax-seed oil alone or mixed with colors, varnishes, and gums, has never proved wholly efficient to prevent the disintegration of stone, the weather staining of brickwork, the crumbling of mortar joints, and the efflorescence of soluble salts, contained to a greater or less degree in all brick, cement, and some varieties of stone; this is owing to the protective materials in themselves being subject both to chemical changes and to chemical action, when exposed for a comparatively short time to the weather. When linseed oil alone is used, should there be any lime or alkaline salts in the wall, these immediately saponify the oil and render it useless, the oil soon drying out and leaving a spotted or mottled surface. Paint is often seen peeling off from the mortar joints of a building and from the brick work as well, owing to the same cause, the caustic alkaline properties of the salts of lime saponifying the linseed oil in the paint.

Dry foundations are necessary in order to prevent moisture from rising by capillary attraction from the damp earth into the bases of walls or stoops. One or more perfectly waterproof courses near the foundations and above the level of the ground, should be introduced as a *"sine qua non"* to a good building. Otherwise, a constant state of dampness, affecting that part of the structure, is apt to produce staining and disintegration beyond redemption. Cement or slate will not effectually answer this purpose owing to their absorbent qualities. Asphalt, sheet lead, copper, or some other non-absorbent material should be used. Sheet lead as a waterproofing foundation is found in the ruins of Roman buildings 2,000 years old. One of the best processes hitherto employed for waterproofing the exterior and interior surfaces of the walls, is the paraffine compound process. The base of this compound is paraffine wax of special manufacture with refined creosote, etc. The method of application is to warm the wall to be treated, to the depth of about one quarter of an inch, thereby evaporating all humidity and rendering it more absorbent. The melted waterproofing material is then applied to the warm surface until absorbed into the pores. It there remains for a brief time in a liquid state, penetrating as deeply as the surface is heated, and gradually hardens as the surface cools. The

pores are thus permanently filled and rendered solid without altering the appearance of the stone, etc., treated. This waterproofing compound thus forced in by heat, and becoming solid when cold, is far more durable and effective than superficial applications of cold solutions, oils, or paints, applied in the usual manner, which do not penetrate far enough into the material, which soon perish, and which are liable to be chipped or rubbed off.

As a preservative of stone and marble, of monuments and statuary, vaults, etc., from the destructive effects of the weather so often observed in cemeteries, the process has proved of great value. For lighter stones, the process unfortunately acts as a dust and dirt collector.

A material successfully used in Europe is fluo-silicate of magnesia, technically known as Fluat. Its application both hardens and rain-proofs stone, but the effect is not instantaneous, as it takes a year to demonstrate itself.

Waters, wá'térz, Clara Erskine Clement, American writer: b. Saint Louis, Mo., 26 Aug. 1834. She is well known as a writer and lecturer upon art. Her writings include: 'Legendary and Mythological Art' (1870); 'Eleanor Maitland' (1881); 'Life of Charlotte Cushman' (1882); 'Stories of Art and Artists' (1887); 'Women Artists in Europe and America' (1903); etc.

Waters, Undergróund. A certain amount of the water that falls on the earth's surface passes underground, the percentage varying with the porosity of the surface materials. This absorption of water is due to the fact that all rocks are somewhat porous and considerably fissured. Sand and gravel deposits are very porous and can store from 5 to 15 per cent of their bulk of water. Sandstones have space between their sand grains, but their porosity varies greatly with size of grain and especially with the amount of cementing material filling the interspaces which in the case of quartzite and some highly calcareous sandstone, fills these spaces entirely. Most sandstones, however, are porous and many hold from 5 to 10 per cent of their bulk of water. Limestones are only slightly porous, but they are always traversed by joint planes and usually, toward the surface, by channels and caverns. Clays, shales and slates have but little capacity for water and the crystalline rocks, such as granite, have very slight porosity. Crystalline rocks, however, are usually traversed by many joint planes and often by zones of decomposition along which surface waters descend for a greater or less distance. In many districts, also, the crystalline rocks are deeply decomposed by the solution of some of their components, and the resulting "rotten rock" is usually as porous as many sandstones. Many lavas are porous and they usually are extensively fissured. Water passes underground in various ways, of which the following are the most prominent: direct inhibition of rainfall; the sinking of surface flows in passing over zones of porous rock; the spreading of streams laterally into the porous deposits of their valleys; and the percolation of water laterally from the ocean or lakes into the materials of the shore. In all regions it is found that the surface run-off and evaporation do not equal the rainfall, which is evidence of general inhibition of water. Many streams are observed

WATERS

to diminish in volume and even to disappear entirely in running over areas of porous sandstones, cavernous limestones, or especially permeable portions of their beds. In many arid regions, waters flow out of the mountains in rock beds and at once sink in the sands of the valleys. In nearly all river valleys there are alluvial deposits in which the water extends laterally from the main stream and some water courses have water only in the sands and gravels of their beds for the greater part of the year.

Waters present various conditions underground, in some cases flowing to lower levels, through permeable rocks, caverns in limestone, or crevices in the harder rocks, to emerge as springs in hillsides, valley bottoms, or even out under the ocean, as off the east coast of Florida. Usually the water supply fills an underground reservoir of sand, gravel, porous sandstone, decomposed crystalline rock, or fissures. Water under this condition is usually designated "ground water" and its surface level is known as

similar but the water at *D* escapes in springs, so there is a constant flow from *C* toward *D*. On account of this flow to a lower level there is gradual diminution of "head" of the water from *C* to *D*, known as the "hydrostatic grade." This condition is found in the Central Great

FIG. 2.

Plains of the United States, where there is a bed of porous sandstone with an average thickness of 200 feet, underlying more than 500,000 square miles and in places lying 5,000 feet deep, but apparently filled with water throughout. Many wells draw artesian supplies from this sandstone and in some areas the flows have a surface pressure of over 200 pounds to the square

A

FIG. 1.

the "water plane." In some cases ground water may occupy strata or follow down crevices, for a depth of several hundred feet. Waters which extend far underground are mainly contained in sandstones and some of these water-bearers are of vast extent and often descend to great depths. Two conditions which frequently exist are

FIG. 3.

shown in the above cuts: Fig. 1. Cross-sections showing conditions of underground water in permeable strata. In these sections, a bed of sandstones reaches the surface at *A A* where it receives water from rainfall or sinking of streams. This water passes underground and an artesian basin is formed which would yield a flowing well at *B* and at other points where the land is less elevated than at *A* and *A*. In the second section, the conditions are somewhat

inch. Hundreds of billions of gallons are contained in this stratum. The rate of travel of underground water is slow, averaging about one mile a year in moderately porous sandstone.

In the accompanying figures are shown some conditions of underground waters which have been referred to above. Fig. 2.—Sections of a river valley, showing the relations of underground waters. This valley is cut in rock but partly filled with sand and gravel, as shown by the stipple. The river flows on the surface at *A* but the waters also flow slowly underground in an "underflow" and pass laterally into the sands, filling them to the "water plane" *B B* at the level of the river. Fig. 3.—Fissured and decomposed crystalline rock. Surface waters often sink deeply and occur in considerable volume under the conditions shown in this figure. *A* is the zone of decomposition and disintegration of the rock. *B B* are fissures down which the decomposition has progressed still deeper. This condition is found over wide areas in the Piedmont region of the southeastern United States.

N. H. DARTON,
United States Geological Survey.

WATERSHED — WATERTOWN

Watershed. See River.

Watertown, Charles, English naturalist: b. Walton Hall, Wakefield, 3 June 1782; d. 27 May 1865. He was educated at the Roman Catholic College at Stonyhurst, where he evinced a great taste for natural history. He spent many years in travel, and in 1825 published 'Wanderings in South America, the Northwest of the United States, and the Antilles in the years 1812, 1816, 1820, and 1824,' a book which has had great popularity. An illustrated and slightly altered edition was published under the direction of J. G. Wood in 1879. His only other publication is 'Essays in Natural History, with an Autobiography.' These appeared originally in three series (1838, 1844, 1857). In 1870 Norman Moore produced a new edition of them, together with some of his letters and a life. He lived a secluded life for many years at Walton Hall, where he formed a curious collection of animals.

Watertown, Mass., town in Middlesex County; on the Charles River, and on the Boston & Maine Railroad; eight miles west of Boston. It contains the villages of Bemis, Watertown, and Mount Auburn. It is connected with Boston and many of the suburban towns by electric railways. It was first incorporated in 1630. It has a number of manufacturing establishments, chief of which are woolen mills, hosiery works, starch factory, and needle factory. In 1900 (government census) the town had 105 manufacturing establishments, capitalized for \$4,549,242, and employing 2,304 persons, to whom was paid annually the sum of \$1,130,099. The cost of raw material used was \$3,811,808, and the value of the annual products was \$6,078,902. At the U. S. arsenal located here a large amount of modern ordnance work is being produced. The famous Mount Auburn (q.v.) Cemetery is in the town of Watertown. There are two banks, one national and one state. The national bank has a capital of \$100,000, and deposits amounting to \$300,000. The state bank (Watertown Savings Bank) has deposits amounting to \$1,256,660. Pop. (1910) 12,834.

Watertown, N. Y., city, county-seat of Jefferson County; on the Black River (about 10 miles from its entrance to Black River Bay, an arm of Lake Ontario), and on the New York Central & Hudson River Railroad (Rome, Watertown & Ogdensburg and Utica & Black River branches); about 90 miles northwest of Utica and 70 miles north of Syracuse.

Industries.—The city lies on both sides of the river, which here has a fall of 112 feet, producing a 16,500-horse-power. From Carthage, a village 16 miles above the city, to Dexter, eight miles below the city, the river is lined with busy manufacturing villages, all of which contribute in some measure to the prosperity of Watertown. Along this 24 miles of frontage, the investment in paper mill plants alone is over \$7,000,000, and the daily output from the mills is 440 tons. About 2,000 persons are engaged in the paper industry. In the city, besides the many paper mills, other large manufacturing are four carriage works, whose products are shipped all over the world; the Bagley-Sewall Company, manufactory of vises and paper machinery, portable steam-engine works, two large silk mills, running many looms and turning out an excellent product; two thermometer works; one factory producing chemical

and scientific instruments; lock and brass works, plow factory, and pump factory. The air-brake works, which has a thriving branch in Russia, having outgrown its original quarters, purchased several hundred acres of land on the north side of the river, and built shops that will accommodate many thousands of workmen. A city of mechanics' homes is growing up around the works. Watertown has two large flour mills which cater to the wholesale trade; one of the mills manufactures health foods, which are shipped all over the United States and to many foreign markets. According to the United States census of 1900, within the city limits, in the manufacturing establishments, there were employed 4,017 persons, who received annually, for their services, over \$2,100,000. The raw material used each year cost \$4,152,444, and the value of the finished products was \$7,881,977. The manufacturing plants were then capitalized for \$8,281,845. These figures apply to the industrial establishments within the city limits in 1900. Since then the city limits have been extended, many new manufacturing have been established, and nearly all the old plants have been enlarged, so that by 1911 the number and value of the city's manufacturing and products are greatly in excess of 1900.

Trade.—Watertown is the commercial and industrial centre of a large rich agricultural region, and it has an extensive wholesale trade in all kinds of merchandise. It is the distributing centre for a large number of towns and villages. The principal shipments are the products of its manufacturing and farm and dairy products. In 1903 over 200,000 boxes of cheese were sold in the city for about \$1,250,000. It has direct shipping connection with all the cities and villages within 100 miles, and with the Lake Ontario ports.

Buildings and Municipal Improvements.—The mercantile blocks of the city are built around a large parallelogram, and on five of the most important streets. This parallelogram is adorned with parks, a fountain, and a soldiers' monument. Some of the prominent public buildings are the government building, State Armory, opera-house, the banks, and several of the business blocks. The city has 49 miles of water-pipe, 400 hydrants, a daily consumption of 3,500,000 gallons of water, a pump capacity of 6,000,000 (average water pressure, 60 pounds per inch), and a reservoir capacity of 5,000,000 gallons. A filter, at a cost of \$100,000, was completed in the year 1904. Watertown has an area of seven square miles, 70 miles of streets, and is lighted by gas and electricity. There are two hospitals; the City Hospital, to which new buildings are constantly being added, and the Saint Joachim. The latter is conducted by Sisters of Mercy. There are two orphanages, and the Henry Keep Home, a refuge for the aged. The bureau of charity and the supervisor of the poor department are most efficient departments. A beautiful park crowns and overlooks the city. It covers about 600 acres, upon which for several years there has been an annual expenditure of \$75,000. The name of the donor has not been made public. The city's mean temperature, in summer, is 65° F and in winter 20° F.

Churches, Schools, Libraries.—The city has 23 churches valued at over half a million; Trin-

WATERTOWN — WATERVLIEF

ity, Protestant Episcopal, cost \$150,000; Holy Family, Roman Catholic, \$100,000. There are 11 school buildings valued at \$377,250; the high school cost \$100,000. The high school was established in 1869. The public school teachers number 112, the number of pupils enrolled, in 1903, was over 4,000. Other educational institutions are Immaculate Heart Academy, private business schools, and several school libraries. The Flower Memorial Library, a modern building, is the gift of Mrs. Emma Flower-Taylor, in honor of her father, Roswell P. Flower (q.v.). The building is white marble and cost \$200,000.

Banks.—Watertown has seven banks, five national and two state. The national banks have a combined capital of \$571,240, and the deposits in the seven banks amount to more than \$10,000,000.

Watertown was settled in 1800 by H. Coffen and Zacharia Butterfield. It was incorporated 5 April 1816, and chartered as a city in 1869. Pop. (1880) 9,883; (1890) 14,725; (1900) 21,606; (1910) 26,730.

Consult: 'Stafford's Gazetteer' (1813); 'The Gazetteer of New York' (1836); Hough, 'History of Jefferson County'; Skinner, 'Watertown'; Evert, 'History of Jefferson County'; 'Jefferson County Gazetteer'; Haddock, 'Centennial History of Jefferson County'; Emmerston, 'Jefferson County' (1898).

R. A. OAKES.

Watertown, S. Dak., city, county-seat of Coddington County; on the Big Sioux River, and on the Chicago & Northwestern, the Minneapolis & Saint Louis, the Burlington, Cedar Rapids & Northern, the Chicago & Northwestern, and the Great Northern R.R.'s; about 100 miles north by west of Sioux Falls. It is in a fertile agricultural region, in which the chief product is wheat. Stock-raising is given considerable attention. The city has flour mills, machine shops, large grain elevators, and stock-yards. It has an extensive trade in grain and live-stock. About three miles from the city is Lake Kampeska, one of the beautiful bodies of water of the State. There are eight churches, a public high school, and graded elementary schools. The three national banks have a combined capital of \$125,000 and deposits amounting to \$819,100. Pop. (1910) 7,010.

Watertown, Wis., city in Jefferson and Dodge counties; on the Rock River, and on the Chicago, Milwaukee & Saint Paul and the Chicago & Northwestern R.R.'s; about 44 miles west of Milwaukee and 38 miles east of Madison, the capital of the State. It is on both sides of the river, and has considerable water-power, which is utilized by various manufacturing establishments, chief of which are a large shoe factory, flour mill, foundry, machine shops, brewery, cigar factories, box factory, furniture factory, and creameries. In 1900 (government census) the city had 86 manufacturing establishments, capitalized for \$1,776,312. The value of the annual products was \$1,625,982. Watertown has several educational institutions, chief of which are College of Our Lady of the Sacred Heart (R. C.), Northwestern University (Lutheran), a high school, three large public schools, two parish schools, and a free public library. The three banks have a combined capital of \$275,000 and deposits amounting to over \$1,100,000. The gov-

ernment is vested in a mayor and a council of 14 members, elected biennially.

Watertown was first settled by Timothy Johnson, in 1836, and was incorporated in 1837. In 1853 it was chartered as a city. Pop. (1910) 8,829.

JAMES W. MOORE,
Editor 'Gazette.'

Waterville, Maine, city in Kennebec County; on the Kennebec River, and on the Boston & Maine Railroad; about 17 miles north by east of Augusta and 78 miles northeast of Portland. It was settled about 1760 by emigrants from Cape Cod, and was part of Winslow until 1802, when it was set off as a town and incorporated. In 1873 West Waterville was set off from Waterville, and in 1888 the city charter was granted. The Wakefield & Fairfield and the Waterville & Oakland electric railways connect the city with all the near-by places. The Ticonic Falls furnish some of the water-power used by the manufactories. The chief industrial establishments are the cotton mills, which have 1,100 employees; railroad shops, 300 employees; woolen factories, 500; and shirt factory, 150. There are about 300 men in the employ of the railroad as train and yard men, and a total of about 500 employees in a number of the small manufactories. In 1909 (government census) the total number of employees was 1,890. There were 33 manufactories, capitalized for \$4,762,000, which produced each year finished products amounting to \$3,179,000. There are nine churches, Colby College (Baptist), founded in 1818, Coburn Classical Institute, Ursuline Academy (R. C.), a public high school, public and parish elementary schools, and school libraries. The four banks have a combined capital of \$500,000. The Waterville Savings Bank has deposits amounting to approximately \$1,200,000. The government is vested in a mayor, seven aldermen, and 14 councilmen, elected annually. There are a number of French Canadians, but the majority of the inhabitants are native born. Pop. (1890) 7,107; (1900) 9,477; (1910) 11,458.

THOS. F. MURPHY,
Editor 'Sentinel.'

Waterville, N. Y., village in Oneida County, on the Lackawanna Railroad; about 22 miles southwest of Utica. It is in an agricultural region in which hops and vegetables are the chief products. It has steam grist mills, wood-work factory, and shoe factory. The principal public buildings are the Granger and Masonic halls, the Y. M. C. A. building, and the churches and schools. There are six churches, a high school established in 1872, public graded schools, and a public library. There are two banks; the national bank has a capital of \$150,000. Pop. (1910) 1,410.

Watervliet, wá-tér-vliet', N. Y., city in Albany County; on the Hudson River, the Erie Canal, and the Delaware & Hudson Railroad; opposite Troy and four miles north of Albany. It is connected with Albany by steam and electric railways, and thus with the New York Central & Hudson River Railroad. It is connected with Troy by an iron bridge, over which pass electric cars for both passengers and freight, and by regular ferry-boats. It is at the head of river navigation and has, by means of the Hudson River, water connections with New York and intermediate points, and by means of Erie

WATERWAYS OF THE UNITED STATES

Canal with the interior of the State and with Lakes Ontario and Erie ports.

Industries.—Watervliet is a manufacturing city. In 1900 (government census) there were 135 manufacturing establishments, which were capitalized for \$1,826,691 and which employed 1,167 persons. The value of the yearly products was \$1,809,241. It has manufactories of woolen goods, bells, iron products, sashes, doors, and blinds, metal harness parts, street cars, car-journal bearings, machine-shop products, and scales. In 1807 the U. S. government established here the Watervliet Arsenal, one of the largest plants for the construction of siege ordnance and field and coast defense belonging to the United States. The arsenal is on a reservation of 100 acres, which has a wharfage, on the Hudson, of 1,000 feet. The usual manufactures for use in war are produced here, as shot and shell, small ammunition, gun-carriage equipments, etc. There are two large stone magazines. On the reservation are quarters for the officers and barracks for the soldiers and also for any civilians who may be employed in the works. There is also a hospital. During the Mexican and the Civil wars there were about 1,500 persons employed, who worked in relays, day and night, preparing materials for the U. S. army. Since 1892 some of the largest guns in the U. S. service have been made here, and the construction works have been constantly in operation on the large guns and necessary equipment required for the army and navy and for coast defenses.

Churches and Schools.—There are 10 churches representing six different denominations; a high school established in 1899, Saint Patrick's Academy, four public schools, four parish schools, a Union Free Library, and a high school library. There is a graded school in connection with Saint Colman's Orphanage.

History.—Watervliet was settled about the time when settlements were made at Albany and other places on the Hudson. It was incorporated as a village, and called West Troy in 1836. In August, 1837, it was chartered as a city under the name of Watervliet. Its industrial growth has been closely connected with the work of the government arsenal. It has many of the social and educational advantages of Albany and Troy. Pop. (1910) 15,074.

Waterways of the United States. The atlas of the world shows that three fourths of its surface is covered with water. The waters of the earth comprise oceans, seas, gulfs, bays, lakes, and rivers. In the main these are navigable, but where not navigable, much has been done to make them so. In addition thereto, extensive systems of intersecting canals have been constructed, so that natural and artificial waters of the world, known as "waterways," comprise all its oceans, seas, gulfs, bays, many of its lakes and rivers, and all navigable canals.

In the United States the ebb and flow of the tide is not the test of navigability, as it was in England before it was abolished by 24 Vict., ch. 10. The Supreme Court of the United States held in the *Daniel Ball*, 10 Wall. 557, that a different test than tidal variations must be applied here to determine navigability. The court say that those rivers must be regarded as public navigable rivers in law, which are navigable in fact; and they are navigable

in fact when they are used, or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water. The commercial power of Congress authorizes such legislation as will insure the convenient and safe navigation of all navigable waters of the United States, whether that consists in requiring the removal of obstructions to their use, in prescribing the form and size of the vessels employed upon them, or in subjecting the vessels to inspection and license. The power to regulate commerce comprehends the control for that purpose and to the extent necessary, of all navigable waters of the United States which are accessible from a state other than those in which they lie. For this purpose they are the public property of the nation, and subject to all the requisite legislation of congress. Recently in *Perry v. Haines*, 191 U. S. 17, the same court decided that admiralty jurisdiction extends to cases of maritime liens upon vessels navigating the Erie canal, as that formed part of a navigable highway for interstate commerce between Lake Erie and the ocean. Thus artificial as well as natural navigable waters are being recognized as public waters in the sense in which Bracton used that term in the rule that *publica vero sunt omnia flumina et portus*. Years ago the English courts decided that the river Severn was a public highway, and the courts of this country have followed the decisions of the Supreme Court of the United States heretofore stated in regard to public navigable waterways. An interior nation has a servitude along natural water courses to reach the highway of nations, known as *jus transitus*, which is recognized by the law of nations. The right of transit over the Danube below the Iron Gates is secured by agreement. In the United States and in Canada, the rivers do not generally flow in foreign territory, so that it is not necessary to invoke the doctrine of *jus transitus*, except in a few cases, as along the Richelieu and lower Saint Lawrence.

The waterways of Maine include 240 miles of seacoast, with many bays indenting it and scores of islands strewn along it. The Saint Croix River on the east is the outlet of Grand Lakes. The Penobscot is 275 miles long and navigable to Bangor by large vessels. It is the outlet of several lakes in central Maine and flows into Penobscot Bay, 30 miles long and 15 miles wide. The Kennebec is 160 miles long and navigable to Augusta. It is the outlet of Moosehead Lake, which is 36 miles long and from 8 to 12 miles wide, and navigated by pleasure steamers. The Androscoggin River drains the famous Rangeley lakes and other lakes, and flows 200 miles into the Kennebec near its mouth. It is navigable only in part and by river craft. Sebago Lake is 12 miles long and 10 miles wide and navigable by small steamers. The principal seaport, Portland, has large commerce and there are several ship yards along the coast. New Hampshire has but little sea-coast and no navigable rivers. Those parts of the Merrimac and Connecticut which pass through New Hampshire are not navigable, except by small river craft and by rafts. The inland lakes of New Hampshire are navigable by small pleasure boats. The same is

WATERWAYS OF THE UNITED STATES

true of the rivers of Massachusetts. It has, however, Boston Harbor, Massachusetts Bay, Cape Cod Bay, which is to be connected with the Atlantic by a canal across Cape Cod, Nantucket Sound, Vineyard Sound, Buzzard's Bay, and several other small bays, all in communication with the ocean. Taunton River is navigable to Taunton, 12 miles from its outlet, which empties into Mount Hope Bay. The Mystic and Charles rivers are navigable at their mouths only. Salem, as a commercial port, has a reputation far more enviable than that for withcraft.

Vermont has part of Lake Memphremagog, which is navigable by lake steamers, and part of Lake Champlain, 120 miles long and 15 miles wide in its extreme width, which has been, since its discovery on 4 July 1609, a highway of commerce for the aborigines, for the colonists, and for Americans generally. It is navigated by large lake steamers, by scores of other steamers, and by many yachts and sailing vessels. It is one of the most picturesque lakes in America and forms an important portion of the 467 miles of waterway between the Saint Lawrence on the north and New York Bay on the south. It contains several beautiful islands such as Isle La Motte, North Hero, and South Hero. Lake Champlain is to be connected with the waters of the Hudson River at Fort Edward by the improved Champlain Canal, having a depth of 12 feet of water, so that vessels drawing 10½ feet may pass from Lake Champlain through into the Hudson River. This will greatly increase the commerce on the lake.

Rhode Island has Narragansett Bay, Mount Hope Bay, Providence and Sakonnet rivers. These are navigable and are frequented by some of the best equipped vessels in America and by hundreds of pleasure boats. The merchant marine of the ports of Rhode Island in 1903 comprised 88 vessels of 15,835 tons. Connecticut has part of Long Island Sound, the Thames River, navigable to Norwich, the Connecticut River, navigable to Hartford, the Naugatuck River, navigable by small craft for a few miles and the Housatonic, 150 miles long and navigable to Shelton. It has several towns along its waterways, such as Stonington, Norwich, New London, New Haven, and Bridgeport. Long Island Sound is 110 miles long and 20 miles wide. It is a great waterway for several superb steamboat lines plying between New York and towns and cities on its northern shore. The Connecticut River at one time was navigated by a number of river boats and had considerable commerce. A line of boats ran between Wells River, Vt., and Hartford. The boats were flat boats and did not draw much water. The Barnet was the first steamer for Connecticut River service. It drew 22 inches of water. On its first trip from Hartford to Vermont it had in tow a barge filled with people. Other steamers were built for river service, in which they were engaged for many years. This river was a great natural highway for the transportation of produce to market. The rapids in the river were overcome by canals at South Hadley Falls, at Turner Falls, and at Bellows Falls.

The waterways of New York comprise that portion of the Atlantic Ocean washing Long Island on the south, and that part of Long Island Sound washing Long Island on the north, and also the upper and lower New York

bays, and a portion of Staten Island Sound, and all of the East, Harlem, and Hudson rivers. New York is the largest commercial port in the western hemisphere, and the second largest commercial port in the world, it being exceeded only by London. The total tonnage that entered that port in the year ending 30 June 1903, was 9,053,906 tons, and its clearances amounted to 8,847,072 tons, that being about one half of the entire tonnage of all the Atlantic ports for that year. Its unique position at the confluence of the East and Hudson rivers overlooking one of the finest harbors in the world, has added to its other commercial advantages and is destined to continue it as the emporium of the western hemisphere. On the north flows the picturesque Hudson, discovered in September 1609, and navigable by steam vessels 150 miles to the city of Troy, and by canal barges to Waterford. It is to be canalized from Waterford to Fort Edward. It receives on the west the waters of the Mohawk formerly navigable about 95 miles, to Little Falls, which is also to be canalized from the Hudson nearly to the city of Rome. The canalized Hudson and Mohawk are to form a part of the improved canal system of the State of New York, about to be constructed pursuant to the provisions of the Canal Referendum Law introduced in the Senate of the State of New York in the session of 1903 by Senator George A. Davis, chairman of the canal committee of the Senate, which law provides for the issue and sale of the bonds of the State, amounting to \$101,000,000, for the construction of a system of barge canals, having a bottom width of 75 feet and a depth of 12 feet, from the waters of the Hudson to those of Lake Champlain, Lake Ontario, and Lake Erie, adequate for barges carrying 1,000 tons. This law received the phenomenal popular approval of 245,000 majority in the State at the general election in 1903. This is the largest canal improvement project ever undertaken by one of the American States, and one of the largest ever undertaken in the history of the world. West of the city of Rome is Oneida Lake, into which flows Wood Creek, which is to be canalized and connected with the Mohawk. Oneida Lake, Oneida River, and Oswego River are all to be canalized, as well as the Seneca River from the Three River point to the outlet of Onondaga Lake, and thence southwesterly nearly to Seneca Lake. New York contains several beautiful bodies of water, such as Lake George, part of Lake Champlain, part of Lake Ontario, part of Lake Erie, Onondaga, Skaneateles, Cayuga, Seneca, Keuka, Canandaigua, and Chautauqua Lake, all navigable by steamers. Seneca Lake formerly had a large commerce, which undoubtedly will be revived by improving its outlet and forming a connection with the new 1,000-ton barge canal. It has also been proposed to improve the outlet of Cayuga Lake in a similar manner. All of these lakes are navigated by passenger steamers during the summer months. The waterways of New Jersey comprise a portion of the lower Hudson, upper New York Bay, Newark Bay, Staten Island Sound, Raritan Bay, the Atlantic Ocean and several arms of the ocean indenting the eastern coast of New Jersey, and Delaware Bay on the south, and the Delaware River on the west, and other rivers intersecting it. These

WATERWAYS OF THE UNITED STATES

are all navigable. The Delaware River on the west is between 300 and 350 miles long, and extends the entire length of its western border, dividing it from the States of Pennsylvania and Delaware. It is navigable to Philadelphia by ocean steamships, and to Trenton by ordinary river vessels. The Raritan River is navigable from Raritan Bay to New Brunswick, and from that point along the bed of the Raritan and Millstone rivers to Trenton is a canal, thus joining the waters of lower New York Bay with those of the Delaware. The total length of the Susquehanna River, including tributaries, is over 400 miles, and it is only partially navigable. It flows into the Chesapeake Bay, which is 170 miles long and 50 miles wide. The Delaware and Chesapeake bays are connected by a canal of 10 feet draft. In some portions of its course the Susquehanna has been canalized to overcome rocks and vegetable matter, which obstructed its navigation. Pennsylvania has suffered its extensive canal system to pass from its control. The Potomac River is about 400 miles long and navigable 125 miles for large vessels. It flows into the Chesapeake Bay from the northwest. It receives from the south the waters of the Shenandoah. The Rappahannock River is over 200 miles long and navigable for about 60 miles. The James River is 450 miles long and navigable as far as Richmond. The Roanoke River is 450 miles long and navigable to Weldon. The Roanoke flows into Albemarle Sound, which is about 50 miles long and from 5 to 8 miles wide, and it communicates through Croatan Sound with Pamlico Sound, which is 75 miles long and about 20 miles wide. Both of these sounds are connected with the Chesapeake by the Chesapeake and Albemarle Canal, having a depth of 11½ feet and doing an active business.

The sounds are shallow and communicate with the Atlantic Ocean. Into Pamlico Sound flows the Pamlico and the River Neuse. The Savannah River, whose length including tributaries is 550 miles, is navigable by large vessels to Savannah, and by small vessels to Augusta. The Great Pedee River is navigable 150 miles and flows into the Atlantic Ocean. The St. John's River in Florida is navigable for steamers 150 miles, and small vessels go 150 miles further up. It connects several lakes, some of which communicate with the ocean. The Suwanee River is 250 miles long and navigable in its lower course. The Apalachicola River is 90 miles long and is navigable in its lower course. The Tallapoosa River, 250 miles long and navigable for 40 miles, and the Coosa, 350 miles long, unite to form the Alabama River, 8 miles west of Montgomery. The Alabama River is 350 miles long and navigable from the junction of these two rivers to the Mobile. The Tombigbee, 450 miles in length, unites with the Alabama to form the Mobile, which flows into Mobile Bay and is navigable to Aberdeen in Mississippi. The Tombigbee receives the waters of the Black Warrior River, which is 300 miles long, and navigable to Tuscaloosa. The Mobile River is 45 miles long, and Mobile Bay is 36 miles long and its width is about 10 miles. There are many small lakes in the interior of Florida, which communicate with the Atlantic Ocean. Many other lakes in Florida are connected by rivers and

canals. One of the largest of these is Lake Okeechobee, which is connected by canal and river with the Charlotte Harbor, on the west coast of Florida. There are many bays and inlets indenting the sea-coast from Florida to Mexico. Among the largest of these are Tampa Bay, Choctawhatchee Bay, Perdido Bay, Pensacola, Mobile, Lake Pontchartrain, Lake Borgne, and Mississippi Sound, Timbalier Bay, Cerrebonde Bay, Atchafalaya Bay, Vermilion Bay, Côte Blanche Bay, Sabine Bay, and Galveston Bay.

The Mississippi River, which empties into the Gulf of Mexico, is navigable as far as Saint Paul, a distance of about 2,000 miles, by vessels of moderate draft. It has several large tributaries. On the east is the Yazoo, 280 miles long, and navigable 240 miles. The largest tributary on the east is the Ohio. It is 1,100 miles long and from ½ to ¾ mile wide, and is formed by the union of the Allegheny and Monongahela rivers, and is navigable by vessels drawing six feet of water. Dams have been constructed at 38 different points in the river between Pittsburg and Cincinnati to raise the water levels in the intervening sections. The dams are passed by locks 600 feet long and 110 feet wide, having a depth of 6 feet of water. The Monongahela River is navigable for upward of 100 miles above its confluence with the Allegheny by large river craft, and for a distance of 50 or 60 miles further by small river craft. The Allegheny River is navigable from Waterford near French Creek and 15 miles from Lake Erie to its outlet at Pittsburg. The Ohio River has several tributaries, such as the Kenanas, Beaver, Muskingum, Sandy, Scioto, Miami, the Licking, the Kentucky, the Salt, Green, Wabash, Cumberland, and Tennessee. The Muskingum is 240 miles long, navigable 95 miles. The Scioto is 250 miles long and navigable 130 miles. The Kentucky is 250 miles long, navigable to Frankfort. The Wabash is 550 miles long, and receives as a tributary on the east the White River. The Tennessee, with its longest tributary, the Holston, is over 100 miles long, and is navigable the greater part of its length. The Cumberland is over 600 miles long and is navigable to Nashville, nearly 200 miles. The tonnage passing down the Ohio River in 1902 was 1,472,575 tons, consisting of coal, steel rails, lumber, sugar, and molasses. There are about 40,000,000 bushels of coal shipped annually from Pittsburg down the Ohio River. In the development of this country the Ohio River was one of the great highways over which the tide of civilization passed westward. Saff boats have given way to barges and steamboats, and the commerce of the Ohio and its tributaries is increasing from year to year, and the number of vessels on the Mississippi and on the Ohio is estimated to be more than 4,000, which annually enter the port of New Orleans. A project is under consideration in Ohio for the construction of a system of canals from Lake Erie on the north to the Ohio River on the south, involving an enormous outlay of money, rendering such canals navigable for barges of 500 tons capacity and upward. The next tributary to the Mississippi on the east is the Illinois, which is 500 miles long, navigable for 245 miles, and receives the waters of the Kankakee and the Desplaines, which latter river has been in part

WATERWAYS OF THE UNITED STATES

canalized and in part paralleled by the Chicago Drainage Canal, 28.05 miles long, 22 feet deep, and 110 feet wide on the bottom, to the south branch of the Chicago River, which communicates through the north branch with Lake Michigan. These form a continuous waterway from the Mississippi River through to Lake Michigan at Chicago. The Chicago Drainage Canal has been made navigable for vessels drawing 22 feet of water, and has the largest prism of any canal of its length in the country. In 1848 the Illinois and Michigan Canal was completed, having a length of 96 miles and a depth of 6 feet, and extending from Chicago to La Salle. Congress authorized the survey for the Hennepin Canal in 1882, connecting the waters of the Illinois River at Hennepin with those of the Mississippi at Rock Island. The Mississippi also has the Wisconsin River as a tributary on the east, which is 600 miles long and navigable up to Portage City, where it connects by a canal with the headwaters of the Fox River in Wisconsin. It flows westerly into the Mississippi. The Fox River, 200 miles long, flows northeasterly through Lake Winnebago into Green Bay. It is navigable. These two rivers and canal form a continuous waterway from the Mississippi to Lake Michigan, which has been declared by the courts a public highway. Through the Wisconsin and Fox rivers steamers may pass from the Mississippi into Lake Michigan. This is one of the three waterways mentioned in Smith's 'History of Wisconsin,' which connect the waters of the Mississippi with those of the Saint Lawrence, the other two being the Illinois and Desplaines rivers and the Miami of the Lakes. The next tributary of the Mississippi on the east is the Saint Croix River, which is navigable for 60 miles. The upper Mississippi is navigable between Saint Anthony's Falls and the Sauk Rapids. The Mississippi River drains several lakes in the central part of Minnesota. The first tributary on the west is the Minnesota, 450 miles long, and navigable to Patterson's Rapids, a distance of 295 miles. The Minnesota River drains Big Stone Lake and Lake Traverse, into which latter lake flows the Red River of the North, which is 700 miles long. The next tributary to the Mississippi is the Des Moines River, 500 miles long, navigable to the city of Des Moines. The next tributary is the Missouri River, which with one of its principal tributaries, the Madison, is over 3,000 miles long, and is navigable for shallow vessels to Fort Benton on the Madison, 2,682 miles. The channel of this river changes so frequently that its navigability is seriously interfered with. The Missouri receives on the east as tributaries the river James and the Big Sioux. On the west the Little Missouri and the Yellowstone, which latter river is over 1,000 miles long and navigable to the mouth of the Big Horn. The Yellowstone River drains the Yellowstone Lake. Other tributaries of the Missouri are the Green River, the Owl, the Big Cheyenne, the White, the Niobrara, all lengthy, but none of them navigable. The Nebraska or Platte, formed by the North and South Fork, and including the North Fork 1,000 miles long, and the Kansas River, including Smoky Hill Form, 900 miles, are all lengthy tributaries of the Missouri, but are not navigable. Congress has been asked to make appropriation, however, to render some of these

lengthy rivers navigable for commercial purposes. The next tributary to the Mississippi on the west is the Saint Francis River, 450 miles long, navigable 80 miles. The next is the White River, 800 miles long and navigable 175 miles to Batesville. The next large tributary to the Mississippi is the Arkansas, 2,000 miles long, and navigable for 800 miles. It has several large tributaries, the most important of which is the Canadian, 900 miles long, and having a tributary, the North Fork, 600 miles long. Another long tributary of the Canadian is the Cimarron. The waters of the Arkansas supply large irrigating canals in Colorado. There are many irrigating canals supplied by the waters of this and other rivers in the vicinity of the Rocky Mountains. The next tributary to the Mississippi is the Red River, 1,200 miles long, and navigable to Shreveport. It has two tributaries on the north, the Washita and the False Washita.

The river Calcasieu, in Louisiana, 200 miles long, flows into Calcasieu Lake, and that empties into the Gulf of Mexico. This river is only partially navigable. Both the river Sabine, 500 miles long, and the River Neches, 350 miles long, flow into Sabine Lake, and that empties into the Gulf of Mexico. The Trinity River in Texas is over 500 miles long, and navigable about half its length. It flows into Galveston Bay, which is 35 miles long, and affords one of the best harbors in the Gulf of Mexico, from which great quantities of produce are exported. The Brazos River is over 900 miles long, navigable over 200 miles, and flows into the Gulf of Mexico. The Colorado River is 900 miles long and navigable during certain seasons of the year as far up as Austin. This river empties into Matagorda Bay. The Guadalupe and the San Antonio rivers are both about 200 miles long, and the Nueces is about 400 miles long, and all flow into bays on the coast of Texas. These rivers have many small tributaries that are not navigable. The Rio Grande is the largest river next to the Mississippi flowing into the Gulf of Mexico. It is 1,800 miles long and navigable by small craft about 450 miles to Kingsbury Rapids. The Colorado River flows into the Gulf of California, is 2,000 miles long and navigable 612 miles. Its largest tributary is the Gila, about 650 miles long. The Sacramento River flows into San Francisco Bay, which is 40 miles long and 12 miles wide, and affords one of the best harbors in the world. On the north in connection with it is San Pablo Bay, which is only 18 feet deep, and into which through the Straits of Karquines flows the Sacramento River. The Sacramento is 500 miles long. Its largest tributary is the San Joaquin, which is 350 miles long, and navigable for large steamers to Stockton, and for small steamers about two thirds of its course. There are other small rivers flowing into the Sacramento from the east.

Improvements undertaken by the general government and the State of California have opened up the Lower Sacramento and connecting waters until the range of tidal action has been extended as far up as Sacramento City, and rendered it navigable for vessels drawing from 10 to 15 feet of water. The Columbia River is about 1,400 miles in length, and flows into the Pacific through a wide mouth, upon which is located Astoria. Upon this river are

WATERWAYS OF THE UNITED STATES

located important salmon fisheries. It is navigable 165 miles to the first Cascade, and above these it is navigable on another level for about 50 miles to the second Cascade, and above those it is navigable for small vessels for a considerable distance further. It has several navigable tributaries. Among these is the Willamette in Oregon, 280 miles long, navigable to the falls at Oregon City, and above them to Eugene City. It receives on the east as a tributary the Snake River, 1,100 miles long, navigable to Lewiston. In Washington there are several bodies of water, such as Lake Chehalis, navigable for small pleasure boats. On the northwest in Washington, communicating with the Strait of Juan de Fuca is Puget Sound, setting far into the interior of the State of Washington. It is about 80 miles long, and is divided into two or more channels. On the easterly shore are located Seattle and Tacoma, and on the south, Olympia. It affords one of the best harbors on the Pacific coast. There are many rivers flowing into the Great Lakes, most of which are not navigable. Among such, however, as are navigable are the Fox River in Wisconsin, already described, which flows into Green Bay, which is 115 miles long and 15 miles wide, and has an extensive commerce. The Grand River in Michigan has been declared to be a public navigable waterway between Grand Rapids and Grand Haven. It flows into Lake Michigan and is over 230 miles long, and is navigable to Grand Rapids by steamers of 120 tons burden. The Saint Joseph River, which flows into Lake Michigan, and is 250 miles long, navigable for about half its length. The Chicago River, a waterway navigable for large lake vessels within the city of Chicago and one of its branches now forms a part of the waterway connecting Lake Michigan with the Mississippi. Between the United States and Canada are five great lakes, constituting together the largest freshwater bodies in the world. Lake Superior on the west is the largest of these, being 412 miles long and has an average width of 70 miles, but its maximum width is 167 miles. It is over 475 feet deep and receives the waters of many small rivers flowing into it. Lake Superior flows, through St. Mary's River, about 50 miles long, into Lake Huron. The United States government has constructed a ship canal to overcome rapids in this river, which is 1 1/4 miles long, 100 feet wide, with a minimum depth of 22 feet of water. The Canadian government has also constructed a canal 1 1/4 miles long, 150 feet wide, with a lock 900 feet long, and 60 feet wide, with a minimum depth of 22 feet. The volume of tonnage through these two canals in the year 1903, was 34,674,437 net tons, and the number of vessel passages was 18,996; and the aggregate freight charges on such tonnage for its entire transit was \$26,727,735. Three quarters of such tonnage was from Lake Superior to other lake ports, and less than one quarter was from other lake ports to Lake Superior ports. The number of passengers on boats passing the locks during the season was 55,175. The cost per ton per mile for carrying such freight averaged 90-100 of a mill, which is very low freight rate. It is estimated that the entire tonnage of the Great Lakes was approximately 55,000,000 tons, for the year 1903. South of Lake Superior lies Lake Michigan,

whose length is 320 miles, its average width is 65 miles, and it has an average depth of 385 feet. Lake Michigan flows through the Straits of Mackinac, 30 miles long and 16 miles wide, into Lake Huron, which is 363 miles long and 101 miles wide, and has a prolongation on the east known as Georgian Bay, wholly in the Dominion of Canada, and 120 miles long and 40 miles wide. Lake Huron flows through the Saint Clair River, 35 miles long and 1 mile wide, into Lake Saint Clair, which is 19 miles long and 25 miles wide. Lake Saint Clair flows into the Detroit River which is 25 miles long, and flows into Lake Erie. Lake Erie is 250 miles long, from 40 to 60 miles wide, and barely exceeding 100 feet in depth. Into Lake Erie flows the Maumee River, 200 miles long, navigable in its lower course, but paralleled by a canal extending across the State of Ohio. It also receives the Sandusky River, which flows into Sandusky Bay, which is 20 miles long and about 4 miles wide. The Sandusky River is about 125 miles long. The Cuyahoga River also flows into Lake Erie. It is between 80 and 90 miles in length and is paralleled by a canal extending across the State, but not in operation. Lake Erie empties into the Niagara River, which is about 34 miles long and 3 mile wide, and whose navigability is interrupted by the Cataract at Niagara Falls and the Whirlpool and other rapids below the Falls as far as Lewiston. A project is under consideration in Congress to construct a 22-foot ship canal from Lake Erie through the Buffalo Harbor to a point in the Niagara River below the city of Buffalo, in order to permit lake vessels of large draft to descend the river to Tonawanda. The traffic on the Niagara River to Tonawanda consists principally of lumber and iron ore. Excursion steamers navigate the Niagara within three miles of Niagara Falls, and Lake Ontario steamers ascend the lower Niagara as far as Lewiston. Niagara River flows into Lake Ontario, which is 190 miles long, 40 miles wide and has a depth of 300 feet. Lake Ontario empties into the Saint Lawrence River. The Genesee River flows into Lake Ontario, and also the Oswego and the Black. The Oswego River is to be canalized and made navigable its entire course for vessels carrying 1,000 tons. The Black River is about 200 miles long, and is paralleled by the Black River Canal in part of its course. There are several bays setting into the mainland from Lake Ontario on the south and east, such as Irondequoit, Sodus, Black River Bay, Chaumont, and Alexandria Bay, which communicates with the Saint Lawrence River, and is one of the most popular summer resorts. It has a large river commerce and many beautiful yachts frequent it during the summer months.

In northern New York are many beautiful lakes in the Adirondack region, such as Saranac, Tupper, Lake Placid, Honondaga, Fulton Chain, Chateaugay, Chazy, Clear Lake, and others. Most of these are navigated by small pleasure craft and are visited by thousands of people every year. In the Champlain Valley is Lake George, 36 miles long and from two to three miles wide. This is navigated by a line of steamers and is one of the most picturesque lakes in America. Its outlet is only five miles from Lake Champlain. Several small rivers flow into Lake Champlain and among

WATKIN—WATKINSON

these the Champlain River, the Missisquoi River and Otter Creek, which are navigable for five or six miles each for Lake Champlain vessels.

There are several hundred miles of artificial waterways in the United States, which were constructed for the purpose of navigation by vessels drawing from three to six feet of water and carrying from 75 to 300 tons of freight. Some of these have been abandoned and others have been permitted to be partially filled with silt and grown up with vegetable matter, while others have been kept in a state of good repair and active operation. At one time Pennsylvania had about 500 miles of navigable canals. The canals of Ohio, such as the Miami and Erie, the Ohio, the Walhonding and the Hocking were in active operation. All these artificial navigable waterways had an extensive commerce. The Erie, Champlain and Oswego canals of New York have carried from three and a half to six millions of tons of freight annually for upwards of 50 years. And they are now to be improved and enlarged so that they will have a maximum carrying capacity of 20,000,000 tons annually. The prism of these new canals will be 12 feet deep and 11 feet over mitre sills and have a bottom width of 75 feet. Their locks will be 328 feet long and 28 feet wide.

Alaska has its picturesque Yukon, 2,000 miles long and navigable for 1,200 miles. It has several tributaries such as the Porcupine River, Big Black River, the Birch River, the Tanana and other smaller rivers. Northeast of Bering Strait is Kotzebue Sound and southeast is North Sound. Both of these are on the western Alaska coast. South of the Yukon is Kuskokwim River, 450 miles long, and still farther south, along or near the coast, are Bristol Bay, Iliamna and Nikhakk lakes, Shelikof Strait, Cook Inlet, William Sound and Copper River, which is 150 miles long. Southern Alaska comprises several connecting waters into which flow Taku and Iskut rivers. All Alaskan waterways are navigable during the warm summer months only, but they serve an important function as a means of reaching the interior to the gold and mineral mines of that territory. Alaska has about 3,000 miles of sea coast and many gulfs, bays and straits, in communication with the Pacific Ocean. Its commerce is growing rapidly and many boats ply between its seaport towns and among its beautiful islands, extending from Chatham Sound and Portland Canal on the east to the farthest-most Aleutian island on the west.

HENRY WAYLAND HILL,

Chairman of the Committee on Commerce and Navigation of the Senate of the State of New York.

Watkin, wôt'kin, Sir Edward William, English railway manager: b. Northenden, Cheshire, 1819; d. London 14 April 1901. He was engaged in the warehouse of his father, a London merchant, from 1839-45, when he became secretary to the Trent Valley Railroad Company, and thenceforward continued in the railway business, becoming general manager and director in various leading companies. He was chairman of the Southeastern in 1867 and of the Metropolitan in 1872, extricating each from financial difficulties. While president of the Canadian Grand Trunk

he prosecuted negotiations which resulted in the confederation of the five British North American provinces. He was elected to Parliament for Great Yarmouth in 1857, but was unseated by petition. In 1864-8 he was member for Stockport, and for Hythe in 1874-95. He was knighted in 1868, and created a baronet in 1880. He was the chief promoter of the Channel tunnel project.

Watkins, wôt'kinz, John Elfrath, American scientist: b. Ben Lomond, Va., 17 May 1852; d. 1903. He was graduated from Lafayette College in 1871, and until 1872 was mining engineer for the Delaware & Hudson Canal Company. He was appointed curator of the United States National Museum in 1877, an office he occupied until 1892, and in 1895 became superintendent and curator of its technological collections. He wrote much concerning the development of railroad and telegraph systems, including: 'The Evolution of the Railway Passenger Car' (1888); 'History of the Pennsylvania Railroad, 1846-96' (1896), etc.

Watkins, N. Y., village, county-seat of Schuyler County; on Seneca Lake, and on the New York Central & Hudson River (Fall Brook) and the North Central R.R.'s; about 20 miles north of Elmira. It is in an agricultural region in which are large vineyards. The Glen Springs Sanitarium is a famous salt plant, but the chief attraction is the glen. The principal manufactures are flour and lumber mills, wagon and carriage factories, and iron foundries. Several mineral springs are near by. Large quantities of grapes are shipped in the season. The village has a high school, founded in 1863, graded schools, two libraries, and two private banks. Pop. (1910) 2,817.

Watkins' Glen, N. Y., near the village of Watkins, in Schuyler County, a ravine noted for its picturesque scenery and its great beauty. The rocks are Devonian shale, which, during the Pleistocene period, were cut into narrow gorges by the glacial ice. The gorge here is, in places, 300 feet deep, and a narrow stream flows through forming a succession of beautiful cascades and rapids. On the slope from the crest of the elevation overlooking a most charming part of the gorge, to the village of Watkins, is a cemetery, which for natural beauty is rarely equaled. The artist, Hope, made Watkins his home for many years, and he was laid to rest in the cemetery he so much admired. Many tourists visit the glen each year.

Watkinson, wôt'kin-sôn, David, American philanthropist: b. Lavenham, Suffolk, 17 Jan. 1778; d. Hartford, Conn., 13 Dec. 1857. He came with his parents to the United States in 1795 and was for a time engaged in a New York counting house. He established a business in Hartford with his brother William in 1800, and retired in 1841 with an immense fortune. His will bequeathed large sums to various charitable institutions and he also gave \$100,000 to the Connecticut Historical Society for a reference library.

Watkinson, William L., English Wesleyan clergyman: b. Hull, Yorkshire, 30 Aug. 1838. He became editor of the 'Wesleyan Methodist Magazine,' and of the London 'Quarterly Review,' and in 1897-8 was president of the Wesleyan Conference. He has published: 'Mistaken Signs' (1882); 'The Influence of Skepticism on

WATLALA INDIANS—WATSON

Character' (1886); 'The Transfigured Sackcloth' (1893); 'Studies in Christian Character, Work, and Experience' (1901); 'The Bane and the Antidote' (1902); etc. He has received degrees from American universities.

Watlala Indians, a tribe of the Chinookan stock of North American Indians, who call themselves Kwikwulit, and who have also been known as Upper Chinook, Wahlellah, "Dog River, or Cascade Indians," etc. They formerly occupied the Cascades and about Dog River, which discharges into the Columbia about midway between the Cascades and The Dalles, in Wasco County, Oregon. They numbered but 80 souls in 1854; in the next year they entered into the Wasco treaty, by which they agreed to move to the Warm Springs Reservation, where a few of them now are, while the others are still about the Cascades. Their language is almost identical with that of the Wasco (q.v.).

Watling (wōt'ling) Street, England, one of the great Roman roads, commencing at Dover, passing through Canterbury and Rochester to London, and thence to Chester and York, and north in two branches to Carlisle and the Wall in the neighborhood of Newcastle. Traces of the ancient road are still found in many parts of its course, and in some it is still an important highway; a street in London retains its name. It was the line of division in the treaty between Alfred and Guthrum the Dane, and it is still the boundary between Warwickshire and Leicestershire. Of the origin of Watling nothing is now remembered; it is supposed to be a corruption of Stratum Vitellianum; a trace also survives in the name Wattlesborough, a place on Watling street near Wroxeter (Uriconium).

Watlings (wōt'lingz) Island, one of the Bahamas, British West Indies, lying 220 miles northeast of Cuba. It is 18 miles long and has a lagoon near the centre. It is fertile, but sparsely inhabited. It is now generally admitted to be the first landing place of Columbus, called by him San Salvador.

Watseka, wōt'sē'ka, Ill., city, county-seat of Iroquois County, on the Iroquois River, and on the Chicago & E. I. and the Toledo, P. & W. R.R.'s, about 70 miles south of Chicago and 100 miles east of Peoria. It is in an agricultural and stock-raising region. The chief manufacturing establishments are flour and grist mills, planing mills, knitting mills, tile works, and machine shops. There are seven churches, public elementary schools, and two banks, capitalized at \$100,000, with deposits amounting to \$536,100. Pop. (1910) 2,476.

Watson, wōt'sōn, Alfred Augustus, American Protestant Episcopal bishop: b. New York 21 Aug. 1818; d. 21 April 1905. He was graduated from the University of New York in 1837, studied law and in 1841 was licensed to practise in the New York Supreme Court. He then turned his attention to theology, and in 1845 took priest's orders in the Episcopal Church. During the Civil War he served as chaplain in the Confederate army, and in 1884 was consecrated bishop of East Carolina.

Watson, David T., American lawyer: b. Washington County, Pa., 2 Jan. 1844. He was graduated from Washington and Jefferson College in 1864, studied law at Harvard for two years, was admitted to the bar and has since

successfully engaged in law practice in Pennsylvania. In 1903 he was chosen one of the three counsel for the United States before the Alaskan Boundary Commission.

Watson, Elkanah, American agriculturist: b. Plymouth, Mass., 22 Jan. 1758; d. Port Kent, N. Y., 5 Dec. 1842. He was apprenticed at 15 to John Brown of Providence, founder of the famous mercantile firm, and when 19 was intrusted by him with \$50,000 to be invested in cargoes for the markets of Europe. He made the journey to Charleston successfully and his journal, subsequently published, is the best existing account of the principal towns of the colonies at the time of the Revolution. He opened a branch house in Nantes, France, in 1779, meeting with much success for three years, when he lost his property through the crash of French finances. He returned to America in 1784, engaged in trade between South Carolina and Haiti until 1788, and in 1789 removed to Albany, where he was an active promoter of public enterprises. He projected an internal canal for New York State, founded the Albany Bank, organized the first agricultural society in New York, aided the establishment of western stage routes, and was an earnest worker for improved educational advantages. He removed to Port Kent on Lake Champlain in 1828. He published: 'Tour in Holland' (1790); 'History of Western Canals in the State of New York' (1820); 'History of Agricultural Societies' (1820). Consult Winslow C. Watson, 'Men and Times of the Revolution, or Memoirs of Elkanah Watson' (1855).

Watson, George Lennox, English naval architect: b. Glasgow 30 Oct. 1851; d. 12 Nov. 1904. After a five-years' connection (1867-71) with ship-building firms he established himself in Glasgow in 1872 as a naval architect. His first success was made in 1873 with the racing yacht Clotilde. Subsequently he designed more than 400 vessels, including, besides racing yachts, passenger, mail, and cargo steamers, and some of the largest steam yachts afloat. Among his racing yachts were Vanduara (for John Clark of Paisley); the cutter Britannia (for the Prince of Wales, now Edward VII.), and the Thistle, Valkyrie II., and Valkyrie III., competitors for the America's cup.

Watson, Henry Brereton, Marriott, English novelist: b. Caulfield, Melbourne, Australia, 20 Dec. 1863. Graduated from Canterbury College (Christchurch) in 1883, he went in 1885 to England, where he took up journalism in 1887. He wrote much for the 'National Observer' and was assistant editor of 'Black and White' and the 'Pall-Mall Gazette'. Among his works are: 'Marahuna' (1888); 'The Web of the Spider' (1891); 'The Adventurers' (1898); 'The Skirts of Happy Chance' (1901); 'The House Divided' (1901); 'Godfrey Merivale' (1902); 'Alarums and Excursions' (1903); and 'The Block House by Bull's Ferry' (1904). With J. M. Barrie he was joint-author of the drama 'Richard Savage.'

Watson, James Craig, American astronomer: b. Fingal, Ontario, 28 Jan. 1838; d. Madison, Wis., 23 Nov. 1880. He was graduated from the University of Michigan in 1857, was appointed professor of astronomy there in 1859, and in 1879 accepted the chair of astronomy at

the University of Wisconsin. He accompanied the eclipse expeditions to Iowa in 1869 and to Sicily in 1870, and was in charge of the expedition to Peking, China, for the observation of the transit of Venus in 1874. He was the discoverer of 23 asteroids, and of several comets, receiving the Lalande medal from the Paris Academy in 1870 for the discovery of six asteroids in one year. In 1867 he was elected to the National Academy of Sciences, an institution to which he bequeathed \$16,000 for a research fund and the "Watson medal." He published 'Popular Treatise on Comets' (1860); 'Theoretical Astronomy' (1868); 'Tables for Calculation of Simple and Compound Interest and Discount' (1879); etc.

Watson, John, Canadian philosopher: b. Glasgow, Scotland, 25 Feb. 1847. He was graduated from Glasgow University in 1872 and in the same year was called to the chair of mental and moral philosophy at Queen's University, Kingston, Ont. He has published 'Kant and His English Critics' (1881); 'Schelling's Transcendental Idealism: a Critical Exposition' (1882); 'The Philosophy of Kant as Contained in Extracts from His Own Writings' (1888); 'Comte, Mill, and Spencer, an Outline of Philosophy' (1895); 'Hedonistic Theories, from Aristippus to Spencer' (1895); 'Christianity and Idealism' (1896); 'An Outline of Philosophy with Notes Historical and Critical' (1898).

Watson, John ("IAN MACLAREN"), English Presbyterian clergyman and author: b. Manningtree, Essex, 3 Nov. 1850; d. Mount Pleasant, Iowa, 6 May 1907. He was educated at Edinburgh University, New College (Edinburgh), and the University of Tübingen, was licensed to preach by the free Church of Scotland in 1874, and appointed assistant minister of the Barclay Church, Edinburgh. In 1875 he was ordained minister of Logiealmond (Perthshire) Free Church, whence he went in 1877 to Free Saint Matthew's, Glasgow, and in 1880 to the Sefton Park Presbyterian Church of Liverpool. He was Lyman Beecher lecturer at Yale in 1896, and in 1900 moderator of the synod of the Presbyterian Church of England. Among his religious works are 'The Upper Room' (1895); 'The Mind of the Master' (1896); 'The Potter's Wheel' (1897); 'Companions of the Sorrowful Way' (1898); 'Doctrines of Grace' (1900); and 'The Life of the Master' (1901). He also published several works of fiction, beginning with 'Beside the Bonnie Brier Bush' (1894), a very successful collection of sketches of life and character in Highland and semi-Highland parishes, and including further 'The Days of Auld Lang Syne' (1895), 'Kate Carnegie' (1896), 'A Doctor of the Old School' (1897), 'Afterwards' (1898), and 'Rabbi Saunderson' (1898).

Watson, John Crittenden, American naval officer: b. Frankfort, Ky., 24 Aug. 1842. He was graduated from the United States Naval Academy in 1860, was promoted master in 1861, and assigned to the Sabine. He was transferred to the Hartford, flagship of Admiral Farragut, in 1862, and served under him throughout the war. He participated in the battles of Fort Jackson and Saint Philip, served in the passage of the Vicksburg batteries in 1862, of Fort Hudson in 1863, and was engaged at Mobile Bay in 1864. He received rank as lieutenant-commander in

1866, as commander in 1874, and in 1877-80 was in command of the Wyoming. He was light-house inspector in 1880-6, promoted captain in 1887, and commodore in 1897. In the Spanish-American War of 1898 he commanded the blockading squadron on the northern coast of Cuba, was transferred to the command of the Oregon later in that year, and in 1899 succeeded Admiral Dewey in charge of the Asiatic squadron at Manila, with rank as rear-admiral. In 1900-2 he was president of the Naval Examining Board, and since then has been president of the Examining and Retiring Board.

Watson, John Fanning, American antiquary: b. Batsto, N. J., 1780; d. Germantown, Pa., 23 Dec. 1860. He was a bookseller in Philadelphia for many years and made a careful study of early and Revolutionary history. His publications include: 'Annals of Philadelphia' (1830); 'Historic Tales of the Olden Times in New York' (1832); 'Annals of New York City and State' (1846); 'History of the United States' (1856).

Watson, Mungrave Lewthwaite, English sculptor: b. Hawkdale, Cumberland, near Carlisle, 1804; d. London 28 Oct. 1847. Meeting Flaxman in London in 1823 he gained the friendship of that sculptor, through whose influence he was admitted to the schools of the Royal Academy. He subsequently visited Rome, working under Chantrey (q.v.) and Behnes. His productions include a terra cotta relief, 'Suffer Little Children to Come Unto Me'; and statues of Flaxman, Nelson, Chaucer, and Queen Elizabeth.

Watson, Paul Barron, American author: b. Morristown, N. J., 25 March 1861. He was graduated from Harvard in 1881, subsequently studied law and was admitted to the bar, and has practised in Boston. His published writings are a 'Bibliography of the Pre-Columbian Discoveries of America,' privately printed in 1881, and included in the 4th (enlarged) edition of 'America Not Discovered by Columbus,' by R. B. Anderson (q.v.); 'Marcus Aurelius Antoninus' (1884), the first extended biography of the subject in English; and 'The Swedish Revolution under Gustavus Vasa' (1889).

Watson, Richard, English Anglican prelate: b. Heverham, Westmoreland, August 1737; d. Calgarth Park, Westmoreland, 4 June 1816. He was graduated from Trinity College, Cambridge, in 1759, became professor of chemistry there in 1764, and in 1771 was appointed regius professor of divinity. He became archdeacon of Ely in 1780, and in 1782 was consecrated bishop of Llandaff. His writings include: 'An Apology for Christianity' (1776); 'Chemical Essays' (5 vols., 1781-8); 'An Apology for the Bible' (1796); etc. Consult his son Richard: 'Anecdotes of the Life of Richard Watson' (1817).

Watson, Richard, English Methodist clergyman: b. Barton-upon-Humber, Lincolnshire, 22 Feb. 1781; d. London 8 Jan. 1833. He joined the Wesleyan Methodists at 15 and began preaching. He was ordained in 1800, and shortly afterward joined the Methodists of the New Connection, returning to the Wesleyans in 1812. He was appointed secretary of the Wesleyan Missionary Society in 1817, and in 1826 was president of the conference. He was for a time editor of the *Liverpool Courier* and wrote.

WATSON

'Apology for the People Called Methodists' (1800); 'Life of the Rev. John Wesley' (1831); 'A Biblical and Theological Dictionary' (1831); 'An Exposition of the Gospels of Matthew and Mark' (1833); etc. His collected works were edited by Thomas Jackson, in 13 vols., 1834-7, with 'Memoir'.

Watson, Robert Spence, English publicist and lawyer: b. Gateshead 8 June 1837. He was educated at University College, London, and established a law practice in Gateshead and Newcastle. He was president of the National Liberal Federation in 1890-1902, and has taken an active part in educational movements in Newcastle. He is also known for his writings on economic subjects, particularly the labor question. His publications include 'Industrial Schools' (1867); 'Higher Education in Boroughs' (1868); 'The History of English Rule and Policy in South Africa' (1879); 'Irish Land Law Reform' (1881); 'The Relations of Labor to Higher Education' (1884); 'Boards of Conciliation and Arbitration and Sliding Scales' (1886); 'The Peaceable Settlement of Labor Disputes' (1889); 'Labor, Past, Present, and Future' (1889); 'The Recent History of Industrial Progress' (1891); and 'The Duties of Citizenship' (1895).

Watson, Sereno, American botanist: b. East Windsor Hill, Conn., 1 Dec. 1826; d. Cambridge, Mass., 9 March 1892. He was graduated from Yale in 1847, studied medicine at the University of New York, and in 1867-9 was botanist to the government exploration of the 40th parallel under Clarence King (q.v.). In 1871 he became assistant curator at the Gray Herbarium at Harvard, and from 1874 until his death was curator there. He was elected fellow of the National Academy of Sciences in 1889. Among his publications are: 'Botany,' Vol. V. of 'Reports on the Geological Exploration of the 40th Parallel' (1871); 'Bibliographical Index to North American Botany, Part I., Polypetales' (1876); with W. H. Brewster and Asa Gray, 'Botany of California' (2 vols., 1876-80); etc.

Watson, Thomas, English poet: b. London about 1557; d. 1592. While his fame may seem to have been eclipsed by that of Spenser and Sidney, among his contemporaries he was equally popular for his pastoral and love poetry. He lived in a learned age and translated the 'Antigone' of Sophocles into very elegant Latin. His 'Melibœus, Thomæ Watsoni; seu, Ecloga in Obitum Domini Francisci Walsinghami, Equitis Aurati' (1590) was a graceful Vergilian tribute to the memory of the statesman and diplomat Francis Walsingham (q.v.). His sonnets, 'Tears of Fancie; or Love Disdained,' evidently gave suggestions to Shakespeare in the composition of his 'Sonnets.' Consult Arber, 'English Reprints' (1892).

Watson, Thomas Edward, American lawyer and politician: b. Columbia County, Ga., 5 Sept. 1856. He entered Mercer University but did not complete the course there, and then took up the study of law and was admitted to the bar in 1875. He began the practice of his profession at Thompson, Ga., and rapidly attained a reputation as one of the leading lawyers of the State. In politics he was at first a Democrat; was elected to the State legislature in 1882, and served as Democratic elector-at-large in 1888.

He was active in the Farmers' Alliance movement, and finally affiliated himself with the People's Party; in 1890 he was elected to Congress on the Populist ticket, and for some time edited a Populist paper at Atlanta. While in Congress he obtained the first appropriation for the rural free delivery of mail. He was the nominee of the People's Party for vice-president, in 1896, and for president in 1904, and in 1908 of the Populist Party for president. His publications include 'The Story of France' (1898); 'Life of Napoleon' (1902); 'Life and Times of Thomas Jefferson' (1903); etc.

Watson, William, American scientist: b. Nantucket, Mass., 19 Jan. 1834. He was graduated from the Lawrence Scientific School of Harvard in 1857; was an instructor there in 1857-9; in 1859-63 was in Europe collecting information on technical education, which, when communicated to W. B. Rogers, was made the basis of the organization of the Massachusetts Institute of Technology; and from 1865 to 1873 was professor of mechanical engineering and descriptive geometry in that institution. In 1884 he was elected secretary of the American Academy of Arts and Sciences. In addition to numerous technical papers, he has published various writings, including: 'Technical Education' (1872); 'Course in Descriptive Geometry' (1873); 'Courses in Shades and Shadows' (1889); 'The Civil Engineering, Architecture, and Public Works of the Paris Exposition of 1889' (1891); and 'The International Water Transportation Congress, Chicago, 1893' (1894).

Watson, William, English poet: b. Burley-in-Wharfedale, Yorkshire, 2 Aug. 1859. He was privately educated, and in 1880 published his first volume of verse, 'The Prince's Quest, and Other Poems,' which showed the influence of Keats and William Morris, and found favor with Rossetti. In 1884 he issued his 'Epigrams of Art, Life, and Nature,' containing much highly-finished work, but it was not till the publication of 'Wordsworth's Grave, and Other Poems,' in 1890, that he gained adequate recognition. The volume of his 'Poems' published in 1892 was a reprint of the 1890 volume with the addition of 26 new pieces. Of 'Lachrymæ Musarum, and Other Poems' (1892), the title-poem is a fine eulogy of Lord Tennyson. 'The Eloping Angels' followed in 1893, 'Odes, and other Poems,' in 1894, and 'The Father of the Forest, and Other Poems,' in 1895. To 1896 belong two volumes of sonnets on the Armenian atrocities, with the titles 'The Year of Shame' and 'The Purple East'; to 1897, 'The Hope of the World, and Other Poems.' His 'Collected Poems' (1898) ought rather to be called 'Selected Poems,' since from them are excluded all of the 1880 and 1893 volumes, more than half of the 'Epigrams,' most of 'The Year of Shame,' and portions of the other volumes. He wrote in 1902 one of the more prominent odes on the coronation of Edward VII., and in 1903 'For England.' He has written in prose a volume of literary essays, 'Excursions in Criticism' (1893). Watson's work is carefully wrought, reflective in tone, and marked by an air of distinction. It has been sometimes criticized as occasionally too closely an echo of greater poets. He was prominently mentioned as a possible successor to Tennyson in the laureateship.

Watsonville, wŏt'sŏn-vŭl, Cal., city in Santa Cruz County; on the Pajaro River, and on the Southern Pacific Railroad; about five miles from Monterey Bay, an arm of the Pacific Ocean, and 18 miles southeast of Santa Cruz. It is in an agricultural and fruit-growing region. Sugar beets are one of the chief products grown in the vicinity. The principal manufacturing establishment is the sugar beet factory, which has a beet-crushing capacity of over 1,000 tons and a sugar manufacturing capacity of over 200 tons each day. There are four state banks, capitalized for \$180,000, and with deposits amounting to \$1,468,000. Pop. (1910) census, 4,446.

Watt, wŏt, James, Scottish engineer: b. Greenock, Renfrewshire, 19 Jan. 1736; d. Heathfield, near Birmingham, Staffordshire, 25 Aug. 1819. Having determined to adopt the trade of mathematical instrument maker, he spent a year in London learning the art, in which he attained great dexterity, and after his return endeavored to set himself up in business in Glasgow. In this he might not, perhaps, have succeeded, owing to the opposition of other workers in the trade, had he not been appointed (1757) mathematical instrument maker to the university, which was outside of the jurisdiction of the Glasgow municipality. While thus employed he was also active in preparing surveys and reports in connection with canal, river, and harbor work. It was during this period that he thought of and completed most of his improvements of the steam-engine. The idea of a separate condenser first occurred to him in 1764, and in January 1769 he took out the patent for the improvements of the steam-engine in which this idea was applied. Previous to Watt's time, the cylinder itself had been used as a condenser, and the jet of cold water introduced into the cylinder to condense the steam so reduced the temperature of the cylinder that three times as large a supply of steam (so Watt estimated) was demanded as was really needed. Watt, therefore, set to work to condense the steam in a separate receptacle. The change was so important as to make him almost the inventor of the modern engine. But it was not till the year 1774 that he united with Matthew Boulton (q.v.), a manufacturer at Birmingham, in order to carry his improvements into execution. In consequence of this he removed to Soho, near Birmingham, where the establishment in which his steam-engines were manufactured soon acquired a European fame. He retired from the business in 1800, when his patent, which had been renewed in 1775 for 25 years, expired. Watt was a fellow of the Royal Societies both of London and Edinburgh, and one of the few natives of Great Britain who have been elected members of the National Institute of France. Besides the expedient of the condenser, Watt made also other improvements in the steam engine. He devised the sun-and-planet gear wheel, made use of the expansion principle to obtain the double engine, applied the governor to the regulation of the speed of steam-engines. He also patented a fuel-saving furnace, invented copying ink, and independently discovered the chemical composition of water. He had a powerful memory, and the range of his reading was very wide. Chemistry, architecture, music, law, metaphysics, and language were the principal subjects which

in addition to physical science and its practical applications, engaged his attention, and in all of them his knowledge was wonderfully extensive, minute, and accurate. For an account of the improvements that Watt effected in the steam-engine see STEAM-ENGINE. The significance of his work places him among the foremost of inventors. Consult further, Muirhead, 'Origin and Progress of the Mechanical Inventions of James Watt' (1854); a 'Life' abridged from the preceding (1868); Smiles, 'Lives of Boulton and Watt' (1865); Thurston, 'The Growth of the Steam-Engine' (1879); and an article by Cowper in the 'Transactions' of the Institution of Mechanical Engineers for 1883.

Watt, in electricity, the unit of activity or rate of doing work. It is measured by the product of the voltage or electromotive force of the source into the current supplied. Thus a dynamo which is yielding 30 amperes at a voltage of 100 is working with an activity of 3,000 watts. The watt is equal to 0.735 foot-pound per second; so that one horse-power per second is equal to 746 watts. It is customary to use the kilowatt as the practical unit. See OHM; WATT; VOLT.

Watteau, vâ-tô, Jean Antoine, French painter: b. Valenciennes 10 Oct. 1684; d. Nogent-sur-Marne 18 July 1721. His parents, whose situation in life was humble, with difficulty contrived to give him the instructions of a very inferior master in the country. In 1702 he went to Paris, in company with a scene-painter, with whom he continued to work for a few months. Soon after he found employment with one Claude Gillot, who, although only a painter of decorations for ballets, and a designer of costumes and of patterns for tapestry, was a true artist. With him he found an opportunity of practising in all these branches of art, and when he left him he found another master in Claude Audran, a very able man, keeper of the Luxembourg, who was of great service to him in opening to him the famous gallery of the palace in which Rubens had painted in allegory the history of Marie de Médicis. From the study of the great Flemish master he improved his coloring, and when he left Audran 1709 he was a consummate master of his art and a painter of "Fêtes Galantes." He now began to paint on his own account, but met at first with little encouragement. He failed to secure the "Prix de Rome," which would have enabled him to visit Italy, but soon afterward scored a triumph by his 'Un Départ de Troupes.' He was admitted to the Académie in 1717 as a painter of "Fêtes Galantes," and produced many pictures whose power and grace in drawing and coloring his rivals strove in vain to emulate. His subjects were all genre, military, and civil. He excelled in reproducing the costumes, airs, and graces of the fashionable world of his time. His 'L'occupation selon l'Age' sold in 1891 for \$27,300. A year or two before his death he went to England, in order, it is said, to consult a certain Dr. Meade regarding his health, which was never robust. He remained a year, and seems to have received more injury to his health from the English climate than benefit from the doctor's prescriptions and returned to France only to die in the arms of his friend Gersaint.

Consult: Goncourt, 'Catalogue raisonné de l'œuvre peint, dessiné et gravé d'Antoine Wat-

teen' (1875); Pater, 'A Prince of Court Painters' (in 'Imaginary Portraits,' 1887).

Watterson, wôt'er-sôn, Henry, American journalist: b. Washington, D. C., 16 Feb. 1840. He was privately educated, and began journalistic work as editorial writer for the *Washington Star*. In 1861 he joined the Confederate army as a private, and later was aide-de-camp to Generals Forrest and Polk. In 1862 he withdrew from the army to edit the *Rebel* at Chattanooga, a daily paper, recognized as an organ of the Confederate government, but in 1864 returned to the army, and had part in Gen. Johnston's campaign, and the siege of Atlanta. After the war he revived the publication of the *Nashville Republican Banner*; and in 1867 became editor of the *Louisville Journal*. This paper he united with the *Courier*, under the name of the *Courier-Journal*, of which he became editor-in-chief and which he has made one of the leading Southern newspapers. He has been active in politics as a member of the Democratic party; was delegate-at-large to every Democratic National Convention from 1872-92, and was permanent chairman of that of 1876. He was a member of Congress in 1876-8. Though a staunch supporter of Tilden for the presidency, yet in Congress he was one of the leaders in obtaining a peaceable adjustment of the election dispute, and approved the appointment of the Electoral Commission (q.v.). In 1896 he refused to support the Chicago platform of the Democratic Party, and was affiliated with the Gold Democrats. As speaker and editor he has been a consistent advocate of free trade, and particularly of a policy of conciliation between the North and the South. He has published 'Oddities of Southern Life and Character' (1882); 'History of the Spanish-American War' (1899); and 'Abraham Lincoln' (1899).

Wat'-de-bird, or **Wattle-crow**, an Australian honey eater (*Anthochaera carunculata*), so named from the large reddish wattles on its neck. It is about the size of a magpie, and is of bold, active habits.

Wattles, arborescent shrubs (*Acacia*) of Australia and Tasmania, in some places growing to good-sized trees. They have foliage which is compound or reduced to phyllodia, and pretty, crowded flowers, in globose or cylindrical heads. The wattles furnish a gum, used as an adhesive in cotton-printing; the stems make poles, which are serviceable for many "bush" purposes. The bark is a valuable tanning material, known as mimosa- or wattle-bark, and many of the acacia forests have been killed by the stripping of their cortex for this purpose. A good quality of tan-bark is obtained from *A. decurrens* and *A. mollissima*, the black, green, or feathered wattle found also in South Africa. It is one of the most graceful of the acacias, and least destructive of this thorny race to person and clothing. The silver wattle (*A. dealbata*) is a taller tree than the black wattle, with ashen-tinted young foliage. The African wattle is *A. natalia*; the Alpine, *A. pyramidalis*, from the Victorian Alps. *A. juniperina*, the prickly wattle, is an evergreen shrub of Australasia. The raspberry-jam wattle (*A. acuminata*) of the same region, yields a cabinet wood, having the odor of that sweetmeat. The wallaby- (*A. rigens*) and varnish-wattle (*A.*

verniciiflua), are also Australian shrubs. The soap-pod wattle is the same as the soap-nut (q.v.) of India. Savannah wattles are West Indian trees (*Cithorexylum quadrangulare* and *C. cinerea*) of the verbena family.

Watts, wôts, George Frederick, English painter: b. London 23 Feb. 1817; d. there 1 July 1904. He studied in the Royal Academy and in 1837 exhibited there two portraits of young ladies and a subject-picture entitled 'The Wounded Heron,' and afterwards contributed to various art exhibitions, notably the Royal Academy, the Grosvenor Gallery, and the New Gallery, about 300 pictures of various kinds. Some of these are landscapes and seascapes; a few, such as 'The Sempstress' and 'Under the Arch,' portray contemporary life; but the finest and most characteristic are portraits and allegorical or ideal subjects. His portraits include those of the most eminent men and women of his age, and perhaps form his chief claim to renown, as they were the basis of his reputation as an artist. Of his other pictures the following may be mentioned: 'Isabella Finding Lorenzo Dead' (1840); 'Paolo and Francesca' (1848); 'Orlando Pursuing the Fata Morgana' (1848); 'Life's Illusions' (1849); 'Sir Galahad' (1862); 'The Wife of Pygmalion' (1868); 'The Return of the Dove to the Ark' (1869); 'Daphne' (1870); 'Fata Morgana' (1870); 'The Curse of Cain' (1872); 'The Prodigal' (1873); 'Dedicated to all the Churches' (1875); 'The Dove that Returned not Again' (1877); 'Love and Death' (1877); 'Time and Death' (1878), like the preceding, one of his most notable pictures; 'Orpheus and Eurydice' (1879); 'Paolo and Francesca' (1879); 'Psyche' (1880); 'The Rider on the Pale Horse,' 'The Rider on the Black Horse,' 'The Rider on the White Horse,' and 'The Rider on the Red Horse,' all apocalyptic pictures of 1883; 'Love and Life' (1884); 'Rain Passing Away' (1884); 'The Angel of Death' (1888); 'The Wife of Plutus' (1889); 'She Shall be Called Woman' (1892), a large picture of Eve; 'For He Had Great Possessions' (1894); 'The Outcast' (1895); 'Jonah' (1895); 'Eve Tempted' and 'Eve Repentant' (1896); 'Love Triumphant' (1898); 'Court of Death' (1902). He was in Italy during 1843-7, and was powerfully influenced by Titian and Tintoretto. In 1847 his colossal oil-pictures of 'Echo' and 'Alfred inciting the Saxons to prevent the Landing of the Danes' were awarded a prize of £500 in another Westminster Hall competition. The latter of these now adorns a committee room of the Houses of Parliament. He completed a fresco, 'St. George Overcomes the Dragon,' in 1853, for the Houses of Parliament, and at a later date painted in fresco the west end of the new hall at Lincoln's Inn. After 1896 he was on the list of retired academicians. A large number of his portraits, presented by him to the nation, are now in the National Portrait Gallery, and some of his best allegorical paintings were presented to the National Gallery of British Art (Tate Gallery). To use his own words, he painted ideas rather than objects, and the poetic idealism to which he was faithful throughout all his long career stood in the way of extensive popularity. His drawing was of the utmost correctness and his coloring often extremely

WATTS — WAUKEGAN

time, but while his allegorical subjects were often great in conception and treatment they sometimes required too much literary exposition to appeal to the ordinary picture lover in a clear and direct manner. Consult Monkhouse, 'British Contemporary Artists' (1889); Bateman, 'G. F. Watts' (1901); Chesterton, 'G. F. Watts' (1904).

Watts, Isaac, English Congregational divine: b. Southampton 17 July 1674; d. Stoke, Newington, London, 25 Nov. 1748. He was educated for the ministry at an academy in Stoke-Newington. In 1696-1702 he was a private tutor, in 1699-1702 was assistant to Isaac Chauncy, minister of the Congregational chapel in Mark Lane, London, and in 1702 succeeded to the pastorate. The congregation here was a distinguished one. Watts remained nominally pastor until his death, though from 1713 ill-health frequently interrupted his ministry, and Samuel Price was made co-pastor. Watts had in his own time great popularity as a writer, his manuals of religious instruction and his works of popular divinity having large circulation; while his 'Horse Lyricæ' (1706) admitted him to Johnson's 'Lives of the Poets' and was reprinted in 1834 in a series of 'Sacred Classics' with a memoir by Southey, and his hymns, numbering in all about 600, were the chief part of the psalmody of English Nonconformist congregations. At the beginning of the 18th century only a few unimportant hymns had been written for Dissenters' use, the rule of Calvin having permitted only canticles and metrical Psalms. The dearth of suitable tunes and the custom of 'lining out' hampered Watts' work; he had, too, many defects in rhyme and diction, was at times rhetorical and at others prosaic. But his best hymns are among the finest in English. Many are found in all hymn-books, and about a dozen remain in very general use. A collection was made in 1707, a second edition appearing in 1709. He published in 1722-4 doctrinal treatises of an Arian tendency, but grounds are wanting for believing that he finally passed to that position. His 'Works' were edited by Jennings and Doddridge in 1753; the 'Posthumous Works' were published in 1779. The former were reprinted with additions, and a memoir by Burder, in 1810. Consult further: Gibbons, 'Memoirs' (1780); Milner, 'Life' (1834); Hood, 'Life' (1875); Julian, 'Dictionary of Hymnology' (1892).

Watts, Thomas Hill, American politician: b. Butler County, Ala., 3 Jan. 1819; d. Montgomery, Ala., 16 Sept. 1892. He was graduated from the University of Virginia in 1840, established a law practice in Greenville, Ala., was elected to the State legislature in 1842, 1844-5, and to the State senate in 1853. He opposed the secession movement, but upon the secession of Alabama accepted the situation. He was appointed colonel in the Confederate army and fought at Shiloh, but resigned shortly afterward to become attorney-general in the Confederate cabinet. He was elected governor of Alabama in 1863, but was unseated by the Federal government at the close of the war. He was thereafter engaged in law practice at Montgomery, and with the exception of 1880-1, when he served in the legislature, held no further public office.

Watt's Dyke. See **OFFA'S DYKE**.

Watts-Dun'ton, Theodore, English poet, critic, and novelist. b. St. Ives, Huntingdonshire, 1836. He was educated privately at Cambridge and for a time studied law, but had already gained a reputation as a writer of sonnets when he joined the staff of the 'Examiner' as literary and art critic. On leaving the 'Examiner' he joined the 'Athenæum' staff, and for many years has been one of the chief contributors to that review, his criticisms of poetry being of the most illuminating character. In 1897 he published a poem entitled 'Jubilee Greeting at Spithead to the Men of Greater Britain,' which met with wide appreciation; and in the same year collected in 'The Coming of Love, and Other Poems,' some of the more important of his poetical contributions to the 'Athenæum' and other literary journals. 'Aylwin,' a novel or romance published in 1898 (privately printed 1883), forms a striking prose counterpart to 'The Coming of Love,' and contains excellent pictures of gypsy life. Watts-Dunton has also contributed largely to the 'Nineteenth Century' and other periodicals. Several of the notices in Ward's 'English Poets' are from his pen, and the valuable critical article on poetry in the 'Encyclopædia Britannica' was written by him. Later publications are: 'The Christmas Dream' (1901), and 'The Renaissance of Wonder' (1902). On occasion Watts-Dunton makes free use of the Romany dialect, which he has carefully studied. His best work is probably the critical, especially that dealing with the principles of verse. Consult: Miles, 'Poets and Poetry of the Century,' Vol. IV. (1901); also an article in the 'Idler,' Vol. V., and one by Nicoll in the 'Contemporary,' Vol. LXXIV.

Wagh, wā, Arthur, English author: b. Midsomer Norton, Somerset, 24 Aug. 1866. He was graduated from Oxford in 1889, became a journalist in London in 1890, was London correspondent of the New York 'Critic' in 1893-7, and in 1894 was sub-editor of the London 'New Review.' He acted as literary adviser to Kegan Paul and Company in 1895-1902, and is now managing director of the London publishing firm of Chapman & Hall. He has written: 'Gordon in Africa' (1888); 'Alfred, Lord Tennyson, a Study' (1892); 'Legends of the Wheel' (1898); etc.; and has edited: Johnson's 'Lives of the Poets' (6 vols., 1896); Biographical edition of Dickens (19 vols., 1902-3); and other works.

Waukegan, wā-kē'gan, Ill., city, county-seat of Lake County; on Lake Michigan, and on the Chicago & N. W.; the Elgin, J. & E. (Belt Line) R.R.'s; 35 miles north of Chicago, and 50 miles south of Milwaukee. There are two electric lines which connect the city with the lake ports and near-by villages and towns. The city is on a bluff about 80 feet above the lake. There is a fine beach and a good harbor, which has been improved, thus giving Waukegan the advantages of the lake traffic. It is in an agricultural region, but the city is best known for its manufacturing industries. The chief industrial establishments are steel and wire works, which have about 2,000 employees; sugar refineries, 1,600 employees; brass and iron works, 200; tannery, 100; wood-working factory, 150; wrapper factory, 75; roofing material works, 50; electric scale works, 100;

WAUKESHA—WAUSAU

brewery, 30; and organ-stop factory, 50. The battery company employs about 75 persons, and the coal and dock company about 100. The increase in the manufactories and the number of employees since 1900 shows the growth of the industrial interests of the city. In 1909 (government census) there were 59 manufacturing plants, capitalized for \$17,092,000, and employing 3,090 persons, to whom were paid annually \$2,689,000. The average annual cost of material used was \$14,164,000, and the value of the products, annually, was \$19,984,000. The city ships large amounts of lumber, coal, salt, iron, grain, and manufactured products. The principal public buildings are the county court-house, the municipal buildings, the Jane McAlister Hospital, the library, the churches, and the schools. There are 15 churches, a high school, public and parish elementary schools, and the Carnegie Public Library. The three banks, one national and two state, have a combined capital of \$200,000, and deposits amounting to very nearly \$3,000,000. The government is conducted on the Commission plan; this being one of the 17 cities of Illinois so governed by the month of August, 1911.

The place was settled in 1835 by Thomas Jenkins; was incorporated in 1840, and chartered as a city in 1859. Pop. (1900) 9,426; (1910) 16,069.

W. L. FARNER,
Editor 'Gazette.'

Waukesha, wā'kē-shā, Wis., city, county-seat of Waukesha County; on the Fox River, and on the Chicago M. & St. P., the Chicago & N. W., and the Wisconsin C. R. R.'s; about 18 miles from Lake Michigan, and 98 miles north of Chicago. It was settled in 1834 by Morris D. Cutter. It was incorporated in 1855 and in 1896 was chartered as a city. There are electric railways connecting the city with Milwaukee and with Pewaukee Lake. The city is in an agricultural region, and near by are quarries of dolomite stone much used in buildings. There are here magnesian springs which are noted for their medicinal properties. The waters are bottled for several markets. The chief manufactures are steel and iron products, bottles, beer, flour, and lumber products. There are railroad shops and machine shops. There are nine churches. The educational institutions are Carrol College (Presb.), State Industrial School, a high school, established in 1890, graded public school, Roman Catholic and Lutheran parish schools, and the Carnegie Public Library. The two banks have a combined capital of \$200,000, and the annual business is over \$2,000,000. The government is vested in a mayor and a council of 10 members. Pop. (1910) 8,740.

H. M. YOUNG,
Editor 'Freeman.'

Waukon, wā-kōn', Iowa. town, county-seat of Allamakee County; on the Chicago, Milwaukee & Saint Paul Railroad; about 80 miles north by west, in direct line, from Dubuque. It is in an agricultural, fruit growing, and stock-raising region. It has flour mills, creameries, wagon factories, canning factory, machine shop, grain elevator, and stock-yards. There are seven churches, a high school, public and parish elementary schools, a business college, and a public library. There are three banks, having a combined capital of \$115,000 and deposits amounting to \$627,530. Pop. (1910) 2,779.

Waul, wāl, Thomas Neville. American lawyer: b. Sumter District, S. C., 3 Jan. 1813. He was educated at Columbia College, was licensed to practice law in 1834, and engaged in that profession in Mississippi until 1850, when he removed to Gonzales County, Texas. He served in the Provisional Congress of the Confederate States in 1861-2, recruited in the first year of the war 2,000 troops known as "Waul's Legion," received commission as their colonel, and served through the war. He was a member of the Texas Reconstruction Convention in 1865, and afterward engaged in law practice at Galveston, Texas, until 1896, when he retired.

Waupaca, wa-pā'ka, Wis., city, county-seat of Waupaca County; on the Waupaca River, and on the Wisconsin Central Railroad; about 133 miles northwest of Milwaukee and 38 miles northwest of Oshkosh. It is in an agricultural and stock-raising region. It has excellent water-power, and many attractions which make it a favorite summer resort. The climate is cool in summer and in the vicinity are a number of small picturesque lakes. The chief manufacturing establishments are flour mills, lumber and woolen mills, machine shops, and potato starch factories. It has the State Soldiers' Home, public graded schools and four churches. The two banks have a combined capital of \$100,000. Pop. (1910) 2,789.

Waupun, wāpūn', Wis., city in Fond du Lac and Dodge counties; on the Chicago, Milwaukee and Saint Paul Railroad; about 70 miles northwest of Milwaukee and 17 miles southwest of Fond du Lac. It is in an agricultural region. The chief manufacturing establishments are pump and wind-mill factories, cane goods works, umbrella factory, flour and lumber mills, and creameries. In 1900 (government census) there were 42 manufactories, capitalized for \$493,590. The cost of the raw material used annually was \$793,504, and the value of products was \$1,200,844. The principal buildings are the State prison, the city hall, the churches and schools. The national bank has a capital of \$50,000 and deposits of approximately \$305,300. There are nine churches, a high school, graded schools, and a school library. Pop. (1910) 3,500.

Wausau, wā'sā, Wis., city, county-seat of Marathon County; on the Wisconsin River, and on the Chicago, M. & St. P., and the Chicago & N. W. R.R.'s; about 175 miles northwest of Milwaukee and 130 miles north of Madison, the State capital. The city lies on both sides of the river, and the slope is gradual, but sufficient to give good surface drainage. There are parks, broad paved streets, well shaded, and an excellent water system. The reservoir has a capacity of 3,000,000 gallons per day, and the water is obtained from Big Bull Falls. Wausau is in a region of extensive lumbering interests. The chief manufacturing establishments are saw mills, which employ about 1,000 men; sash and door factory, about 400; box factories, granite works, sand-paper factory, machine shops, excelsior factories, novelty works, veneering factories, canneries, paper mills, and flour mills. In 1909 (government census) Wausau had 67 manufacturing establishments, capitalized for \$5,794,000, and employing 2,285 persons, to whom were paid annually \$1,214,000. The raw material used each year in the manufactories

WAUSEON — WAVE

cost \$3,325,000, and the value of the finished products was \$6,287,000.

The county court-house (cost \$60,000), the government building, the municipal buildings, the County Asylum for the Insane, the churches and schools, the library, and several fine business blocks are among the principal public buildings of the city. There are 20 churches, representing 15 different denominations. The educational institutions are a fine public high school, graded elementary public schools, 10; Roman Catholic and Lutheran parish schools, 5; and a public library. It has also the County Training School for Teachers and a County Agricultural College. There are two national banks and one state bank, having a combined capital of \$410,000, and deposits amounting to about \$3,000,000. The government is administered under a revised charter of 1892, which provides for a mayor and a council of 18 members, who are elected biennially.

Wausau was settled in 1845 by lumbermen. It was planted in 1852 and existed under a town organization until 1861, when it was incorporated as a village. On 18 March 1872 it was chartered as a city. Pop. (1890) 9,253; (1900) 12,354; (1910) 16,560.

E. B. THAYER,
Editor 'Wausau Pilot.'

Wauseon, wá'se-ŭn, Ohio, village, county-seat of Fulton County; on the Lake Shore & Michigan Southern Railroad; about 31 miles west by south of Toledo. It is in an agricultural region, in which are cultivated grain and vegetables. It has flour mills, creamery, machine shop, and wagon works. It has two private banks. The educational institutions are a public high school, graded school, and a public library. Pop. (1910) 2,200.

Wauters, vō-tār, Emile, Belgian painter: b. Brussels 29 Nov. 1846. He was for four years the pupil of Portaels and of Gerome at Paris. His picture, 'Fair Edith finding the Body of Harold on the Field of Hastings,' attracted wide attention and he was sent by his government to attend in a professional capacity the opening of the Suez Canal. He returned from the East with many sketches and genre pictures and materials, out of which he afterward painted his panorama, 'Cairo and the Banks of the Nile.' His historical pictures are characterized by strong drawing and beauty of coloring; the most famous of these is 'Mary of Burgundy before the Magistrates at Ghent.'

Wave, a form of energy propagated from one part of a medium to another by the disturbance in equilibrium, or stress. Examples, water waves, such tides, rollers, ripples; sound waves; heat and light waves; electrical waves; earthquake waves; temperature waves, etc.

Waves in Liquids.—Waves of translation in liquids are formed where the particles of the liquid are moved slightly in advance of their position by the passage of the wave impulse. This wave was thoroughly investigated by Scott Russell, and is known as the Scott Russell wave.

'Its velocity is equal to $\sqrt{g(h+k)}$ where (g) is the force of gravity, (h) the depth of the liquid, at rest, and (k) the height of the crest above the plane of rest.' This is the speed at which a canal boat is most economically propelled; for the reason that the boat rides on the

wave, is carried forward by it, and its speed maintained with the least additional expenditure of power. Oscillatory waves, such as the deep "swell" of the ocean, are formed when the particles of the liquid are forced into circular, or elliptical paths, whose plane is vertical to the line of propagation. When the line of propagation of the disturbance is opposite, and equal to the flow of the liquid, "Standing Waves" are the result, as is often seen in rivers. The velocity of oscillatory waves has been estimated as "40 feet per second for waves of 300 feet in length; and the disturbance of the water particle at a depth of 300 feet to be not over half an inch from its mean position." Ripples in liquids are surface waves which move more rapidly as they diminish in length. "A ripple a quarter of an inch long will move one foot in a second. A ripple an eighth of an inch long will move one and a half feet in a second." This is due to the surface tension of the liquid.

Waves in Aeriform Bodies.—Waves are propagated in air by alternate condensations and rarefactions of the medium. The motion of the air particle is very small, but the wave-length is comparatively long. This length may be found by dividing the velocity by the number of vibrations in a given time. In the propagation of the wave, the layers of air are crowded together and a condensation is thus produced at first, after which a corresponding rarefaction takes place. A wave therefore consists of two parts. The motion of the air particle is backward and forward, and not vertical to the line of propagation, as in the case of water waves. A series of waves in air will show alternate condensations and rarefactions in the form of ever increasing spherical shells (Fig. 1).

FIG. 1.

The velocity of sound waves in aeriform gases varies directly as the square root of the elasticity of the gas, and inversely as the square root of its density. It is usually expressed by the formula

$\sqrt{\frac{E}{D}}$ There is an added velocity of 2 feet for

every Centigrade degree of temperature. So long as aeriform waves are not obstructed in their motion they are propagated in the form of concentric spheres; but when they meet with an obstacle they return upon themselves, forming new concentric waves according to the laws of reflection, see Fig. 2.

Waves in aeriform bodies are also refracted, or bent out of their course, in passing from one medium to another. Two sets of waves which interfere will produce a wave which is equal to their algebraic sum. If the waves are equal and in opposite phases, the sum of their component forces will be zero, and the air particle will come

WAVE

to rest. When a wave of water meets an obstacle, such as a rock, it bends around it, meeting on the other side. This is also the case with waves in air and gases, but the wave so diffuses itself at the back of the obstacle that it is enfeebled in power, and the obstacle casts what is known as a shadow. Sound shadows and light shadows are due to this property of wave motion.

Waves in Solid Bodies.—The vibration of wood and metals in the form of rods and plates may be taken as examples of wave motion in solids. (See **VIBRATION**.) When the vibrating particles of the solid yield up their motion to other particles which in turn perform like excursions in the same period of time, we have a wave propagated through the solid. Such waves in all mediums capable of resistance to distortion, are both transverse and longitudinal. This is the case when an iron bar is struck a blow by a hammer upon one end, two waves are sent through the bar, but the longitudinal has much greater velocity in this case.

FIG. 2.

Earthquake waves are propagated in like manner through the solid earth. The waves which pass through the elastic materials of the earth's crust consist of both longitudinal and transverse vibrations, but the transverse vibrations soon die out, and produce but little effect. In an earthquake disturbance the particles nearest the disturbance are first compressed by the concussion, and then released by the elasticity of the solid earth. This vibratory motion is taken up by the next contiguous particles, and in this manner the pulse or wave is carried to enormous distances. The vibrations of the particles themselves are very small, probably not over one or two inches in length in most cases. If the earth were a homogeneous solid the wave would take the form of concentric spherical shells, similar to air waves, but owing to the different materials composing its crust, and the fractured nature of the crust, its symmetry is destroyed. It should be remarked that the wave here under discussion is the vibratory movement of the crust, and not the violent upheaval, or disruption of the earth itself. When the centre of disturbance is beneath the sea a water wave is generated which travels much slower than the wave through the solid part of the earth. Air waves are also generated by earthquakes which follow the laws of sound waves.

Luminous and Electrical Waves.—The Undulatory Theory of Light presupposes the existence of an invisible medium, filling all space, both molecular and stellar, called the ether,

through which waves of light are propagated, according to the laws of vibration in an elastic solid; and with a velocity equal to the square root of its elasticity divided by the square root

of its density; or $\sqrt{\frac{E}{D}}$.

"In such a medium where the density (D) is small, in comparison with the rigidity that it opposes to any rapid movement, waves will be set up in all directions at right angles to the line of displacement. Let (M) represent a molecule of ether displaced in the direction of the arrow, from A to B ; then (a) will represent one of the waves thus generated at right angles to A, B ."

FIG. 3.

There are innumerable such waves in every ray of light, which are said to be transverse to the line of propagation. Their velocity is 186,000 miles per second, and their wave-lengths vary from 32 millionths, to 15 millionths of an inch. (See **LIGHT**; **SPECTRUM**; **RADIATION**.) This elastic, solid theory of light has been mathematically treated by Green, Fresnel, MacCullagh, Neuman, Cauchy, and others; and has been generally accepted, up to the last few years, as explaining the various phenomena of light. In recent years, especially since 1887, the Electro Magnetic Theory has largely taken its place.

Recent discoveries have shown that electric waves are identical with light waves in the following respects: they can be reflected, refracted, absorbed, polarized, and diffracted. They differ from light waves in their lengths, which are many feet, instead of a few millionths of an inch. In 1864, before these discoveries were made, Professor Clerk Maxwell predicted that light would be found to be due to electrical vibrations in space. This prediction has been abundantly verified by the investigations of Hertz, and others. The investigations of Hertz are illustrated by the following diagram:

FIG. 4.

The electrical discharges of an induction coil (C) are sent through two square sheets of metal (A and B) attached to two metal rods, with a gap between them. These discharges produce electrical oscillations, backward and forward, through the plates and rods, and when the electrical state is sufficiently high, they become visible as a spark, or are luminous. From the discharge, or electrical oscillations in the plates and rods, electric waves (a, a, a) were set up

WAVE OFFERING—WAVERLY

at right angles to the plane of the plates, which traveled with the same velocity as light waves, and became visible to the eye by means of a spark passing across the gap (G) in a metal ring which was placed in the plane of their vibration. Hertz and others reflected these waves by parabolic mirrors, and refracted them with prisms of pitch, also polarized and diffracted them. Professor Righi verified these results, and demonstrated their interference fringes by Fresnel's mirrors. He also investigated the transparency of different media to these waves, and found that certain kinds of wood polarizes them, as tourmaline polarizes light. "Proofs are now complete that these waves possess all the known properties of ordinary light." The most recent application of these waves is to be found in wireless telegraphy.

JOHN R. PADDOCK,
Member of the Association for the Advancement
of Science.

Wave Offering, in Hebrew, *tenuphak*, from *nuph*, to wave, a sacrificial ceremony mentioned in the Old Testament, in Leviticus xiv. 24, in the rites to be followed in cleansing a leper, and in Numbers vi. 20, in the description of ceremonies attending the separation of a Nazarite, and in other places. The offering is believed by the rabbis to have been waved to the four points of the compass, as an acknowledgment of God's sovereignty over the earth, while the heave offering, mentioned in connection with the wave offering, is supposed to have been lifted upward as a tribute to God's rule in heaven.

Wave Motor, a mechanism for obtaining power from the force of ocean waves. The method as adopted in various experiments is as follows: At a point unprotected by outlying rocks or shoals, two wells eight and five feet in diameter, respectively, are sunk in the cliff, one behind the other, the foremost but five feet from the brink. These wells extend from 30 feet above high tide to below the ebb and open at bottom in the ocean. A counterbalanced float rises and falls between vertical guides in the foremost well as the swells outside raise or lower the water level. The plunger of a common force pump working in any part of a long pump barrel occupies the second well, forcing on the down stroke the salt water vertically 125 feet to a 5,000-gallon tank raised on a 60-foot derrick on the bank above. A 35-foot, four-post derrick carries the vertical guides for pump and float, which are fastened at and near the outer end of a 12-inch round timber 60 feet in length, the butt counterbalanced on the bank over two small iron car-wheels rolling on a short track, and thus allowing the timber to recede and advance as well as to oscillate as its outer end follows the vertical guides. The stopping and starting contrivance is the climax of simplicity. A strong chain leads from the outer end of the beam above the float over two shelves at the top of the derrick, and suspends a large barrel in vertical guides at the side. To stop the motor the barrel is filled with water from a short garden hose attached to a convenient connection from the tank. The weight of the filling barrel gradually overbalances the float, raising it above the waves. When the motor is to start, a plug is pulled from the bottom of the barrel and the float gradually goes into action.

Wavellite, an attractive, radiated mineral, essentially a hydrous basic phosphate of aluminum, $4\text{AlPO}_4 \cdot 2\text{Al}(\text{OH})_3 + 9\text{H}_2\text{O}$. It rarely occurs in distinct orthorhombic crystals; usually it is in more or less complete spherical aggregates, externally showing crystal terminations and with radiated structure. Its hardness is 3.25 to 4, and its specific gravity about 2.32. In the many European localities its color is usually white or pale green; at its most important American locality in Arkansas it is light to dark green, while the curious stalactitic wavellite of White Horse, Pennsylvania, is white.

Waverley, *wá'v-ér-ll*, or 'Tis Sixty Years Since, a novel by Sir Walter Scott. It was the earliest of the world-famous series of romances to which it gives its title, and was published in 1814. The author withheld his name at first, from doubt as to the success of the venture. The continuance of the concealment with subsequent issues followed perhaps naturally; Scott himself could give no better reason afterward than that "such was his humor." Although the authorship of the series was generally credited to him, it was never formally acknowledged until the avowal was made in 1827 at a dinner for the benefit of the Edinburgh theatrical fund. 'Waverley' is a tale of the rebellion of the Chevalier Prince Charles Edward, in Scotland in 1745.

Waverly, Ill., village in Morgan County; on the Jacksonville & St. L., and the Saint Louis, C. & St. P. R.R.'s; about 26 miles southwest of Springfield and 20 miles southeast of Jacksonville. It is in an agricultural and stock-raising region, and has flour mills, grain elevators, tile works, creamery, and stock-yards. There are eight churches, graded schools, and two banks. Pop. (1910) 1,538.

Waverly, Iowa, city, county-seat of Bremer County; on the Cedar River, and on the Chicago, R. I. & P., the Illinois C., and the Chicago G. W. R.R.'s; about 27 miles southeast of Charles City and 12 miles north of Cedar Falls. It is in an agricultural and stock-raising region. It has a large number of butter and cheese factories, condensed milk factories, canneries, a furniture factory, a creamery-supply factory, a flour mill, and agricultural implement works. The four banks have a combined capital of \$100,000 and deposits amounting to \$528,470. It has six churches. The educational institutions are Wartburg Teachers' Seminary and Academy, graded public schools, and a public library. The city owns and operates the waterworks. Pop. (1890) 1,337; (1900) 1,573; (1910) 1,205.

Waverly, N. Y., village Tioga County; on the Chemung River, and on the Erie and the Lackawanna R.R.'s; about 17 miles southeast of Elmira and 20 miles southwest of Owego. It is in a region largely devoted to farming and stock-raising. It is a shipping point for large quantities of butter, cheese, milk, eggs, poultry, and farm products. Waverly is near the coal and oil fields of Pennsylvania, and has connection by electric cars with Athens and Sayre, Pa. The two banks have a combined capital of \$100,000. It has six churches, a high school established in 1871, grammar and primary schools, an opera house, and a town hall. Pop. (1910) 4,855.

Waverly, Ohio, village, county-seat of Pike County; on the Scioto River, and on the Norfolk & W., and Ohio S. R.R.'s, 57 miles south of Columbus. It is in an agricultural and stock-raising region; and contains flour and saw-mills, tanneries, distilleries, and furniture factories. There is a high school with a school library of over 1,000 volumes. Pop. (1910) 2,100.

Wavy, the common name in the Hudson Bay region for the smaller wild geese, especially the snow-goose. See *GESE*.

Wax, a concrete, unctuous-feeling substance, which partakes of the nature of fixed oil. It is secreted by bees in constructing their hives, and is also a most abundant vegetable production, entering into the composition of the pollen of flowers, covering the envelope of the plum and of other fruits, especially of the berry of the *Myrica cerifera*, and, in many instances, forming a kind of varnish to the surface of leaves. It is distinguished from fat and resinous bodies by its not readily forming soaps when treated with alkaline solutions. Common wax is always more or less colored, and has a distinct, peculiar odor, of both of which it may be deprived by exposure in thin slices to air, light, and moisture, or more speedily by the action of chlorine. At ordinary temperatures wax is solid and somewhat brittle; but it may be easily cut with a knife, and the fresh surface presents a characteristic appearance, to which the name of waxy lustre is applied. Its specific gravity is .966. At 155° F. it enters into fusion, and boils at a high temperature. Heated to redness in a closed vessel it suffers decomposition, yielding products very similar to those which are procured under the same circumstances from oil. It is insoluble in water, and is only dissolved in small quantities by alcohol or ether. Wax appears to be a mixture of myrcin, cerotic acid, and cerolein. The name wax is now applied to substances other than, but resembling bees'-wax; these substances are partly of animal, partly of vegetable origin. In bleaching wax the wax must be melted, with a degree of heat not sufficient to alter its quality, in a caldron so disposed that the melted wax may flow gradually through a pipe at the bottom of the caldron into a large wooden cylinder that turns continually round its axis, and upon which the melted wax falls. As the surface of this cylinder is always moistened with water, the wax falling upon it does not adhere to it, but quickly becomes solid and flat, and acquires the form of ribands. The continual rotation of the cylinder carries off these ribands as fast as they are formed, and distributes them through the tub. When all the wax now to be whitened is thus formed, it is to be put upon large frames covered with linen cloth, which are supported about a foot and a half above the ground in a situation exposed to the air, the dew and the sun. If the weather be favorable, the color will be nearly discharged in a few days. It is then to be re-melted and formed into ribands, and exposed to the action of the air as before. These operations are to be repeated till the wax is rendered perfectly white, when it is cast into cakes or molded into candles.

The principal applications of wax are to make candles and medicinal ointments; to give a

polish to furniture or floors, for which purpose it is largely used in the United States; to form a lute or cement, for which it is used by chemists; and to serve as a vehicle for colors. By modern painters colors previously prepared in oil are sometimes diluted just before being laid on in a mixture of wax and oil of turpentine. This practice is much resorted to by French artists, especially in mural paintings. The object of it is to keep the painting free from that lustrous appearance which often renders it difficult to be seen properly in consequence of reflection. Wax also forms a principal ingredient in modelers' wax and gilders' wax. In the former the other ingredients are druggists' lead-plaster, olive oil, yellow resin, and whiting; and in the latter verdigris and sulphate of copper. Sealing-wax is not properly a wax at all, but is composed of resin lac and some less brittle resin. The largest consumption of wax takes place in Roman Catholic countries, where large quantities are required for the candles used in religious ceremonies.

Wax Figures.—The employment of wax in imitative art dates from a period anterior to historical times, although, according to Pliny, the art of casting it in molds was not practised previous to the time of Lysistratus, its reputed inventor, who flourished about 300 a.c., and whose productions were chiefly portraits cast in plaster molds taken from the face. Wax portraits eventually became common, and among the Romans, who placed them in the vestibules of their houses, were regarded as an evidence of ancient nobility, as none were allowed to possess such images whose families had not borne some curule magistracy. In the Middle Ages, wax was employed in the construction of images of saints and of votive images, and those who practised sorcery melted before a slow fire wax figures of the persons against whom their incantations were directed. In the latter half of the 15th century Andrea del Verrocchio and Orsino gained considerable reputation by some figures of Lorenzo de' Medici, their joint production, which consisted of frameworks of wood or skeletons for the bodies and limbs, while the heads, hands, and feet were cast in wax, painted in oil colors to counterfeit life. They were furnished with glass eyes and natural hair, and were habited in the costume usually worn by Lorenzo. The manufacture of wax figures of the size of life is still carried on to a considerable extent, but has long ceased to be considered a branch of the fine arts, no imitative skill or taste on the part of the artist being sufficient to overcome the ghastly fixedness which such images must always present, and which is the more disagreeable as the resemblance to life is closer. In the preparation of anatomical models and pathological examples, however, wax has been very advantageously employed, the invention being due to Gaetano Giulio Zumbo, a famous modeler in colored wax, who flourished in the latter half of the 17th century. In the succeeding century the celebrated collection of anatomical models in the Institute of Bologna was commenced under the direction of Ercole Lelli, the finest specimens being by Giovanni Manzoni and his wife, Anna Morandi Manzoni. In the Museum of Natural History at Florence are 15 chambers devoted to preparations by Fontana, Sushni, and other celebrated modelers; the Musée Dupuy-

WAX-FLOWER—WAY

tron at Paris is famous for its morbid specimens; and almost every considerable city of Europe now has its collection.

Wax-flower, or Madagascar Jasmine. See **STEPHANOTIS**.

Wax Insect. See **SCALE INSECTS**.

Wax, Mineral. See **HATCHETTITE**.

Wax, Vegetable, a solid, fatty substance, that may be regarded as a concrete oil, and which is secreted by many plants, sometimes in large enough quantities to be of commercial importance. It forms, on foliage, a varnish or coating, which prevents excessive transpiration or wetting of the cells; and, on twigs and flower-pedicles, by its slippery surface, keeps unwelcome insects from reaching the flowers and robbing them of their honey. The whitened under surfaces of some willow leaves and the bloom of fruit are composed of wax either in granules or rods or spread over the cuticle. The most familiar example in America of the hard fat or wax in quantity is on the bony nutlets of the wax-myrtles or bay-berries (*Myrica*). The gray-coated drupes of *M. carolinensis* clustering on the bare twigs are conspicuous in seashore regions, after the leaves are fallen; the wax clinging to their rough, granular surfaces when melted is a greenish, hard substance, sharing the balsamic odor of the plant. It was used in colonial times as a basis for candles and for a kind of soap. Other species, of other countries, furnish a similar wax, and are known as candle-berries or tallow-trees. Carnauba wax is exported from Brazil for candles and as a substitute for bees'-wax. It is the coating on the young leaves of *Corypha cerifera*, indigenous to tropical South America. The young leaves are removed and dried. The wax-granules may then be shaken off, in the form of a fine dust, melted and caked. A varnish-like exudation of wax, on the stems of two other South American palms, *Klopstockia cerifera* and *Cerroylon andicola*, the wax-palm, the latter being a tall tree, slightly thickened at the centre of the trunk and crowned by a tuft of pinnate leaves. This wax is scraped off and melted. A mixture of resin and wax results, from which the latter is extracted by boiling spirits, and is then utilizable for candles. It is, however, seldom seen in commerce. Japan wax is a wax-like, hard fat, which is largely exported from Japan to Europe, in yellowish hard cakes, with a resinous, rancid odor, and often covered with a powdery efflorescence. It is mixed with or substituted for bees'-wax, where its rancid odor is not preventive, and is extracted by several methods, such as heating under pressure or boiling from the crushed drupes of oriental species of sumac (q.v.).

Waxahachie, waks-a-hach'ee, Texas, town, county-seat of Ellis County; on the Missouri, Kansas & Texas and the Houston & Texas Central R.R.'s; about 178 miles northeast of Austin, the State capital, and 31 miles south of Dallas. It was founded in 1847. It is in an agricultural and stock-raising region, in which are produced large crops of wheat and a good quality of cotton. The manufactories are cotton-seed-oil mills, cotton compresses, and flour mills. It is a cotton centre for an extensive region; its annual cotton receipts are about 65,000 bales. The principal public buildings are the county

court-house (original cost \$150,000), the banks, churches, and schools. There are six churches, Park High School (white), a high school for colored pupils, established 1893, public elementary and private schools, and a library. There are three national banks and one trust company. Pop. (1910) 6,205.

Wax-bill, or Senegal Finch, an African weaver-bird (*Estrilda astrida*), one of the section of the family called blood-finches on account of the prevalence of red in the plumage. This has long been a favorite among cage-birds, and is sold by dealers all over the world. It is nearly 5 inches long. The beak is bright red and somewhat swollen. A bright red stripe passes between the eyes, and the middle of the breast and belly is a beautiful reddish-brown. The upper surface of the body is brownish-gray, the lower surfaces lighter, everywhere traversed by very fine blackish wavy lines; wings and tail brown. They are varied much in color by breeders, bright blue tints, even, having been developed in some. Their song is not very interesting, but they are pretty and affectionate in a high degree. Their food and care should be similar to those given to a canary.

Wax-wing, a woodland bird of the family *Ampelidae*, a small isolated group of birds of the northern hemisphere, characterized by their shrike-like beaks, silky brown plumage, tall erectile crests, and especially by the tips of the wing and tail-quills terminating in flattened scales closely resembling red sealing-wax. There are but three species, the northern or Bohemian wax-wing (*A. garrulus*); the Siberian wax-wing (*A. phanicoptera*), and the common North American cedar-bird (q.v.). The northern wax-wings make their home near the Arctic coasts of both continents, and breed there, in trees, long before the snow has disappeared in spring. Sometimes it is not seen in the United States or Central Europe for years together, then will appear in vast numbers, but very locally. These erratic movements are doubtless due to presence or absence of food, which consists of both insects and berries (the latter mainly, of course, in winter), but were regarded by the superstitious peasantry of Europe as signs of some visitation of war or pestilence to follow. All the wax-wings are cinnamon-brown, relieved by handsome markings of black, gray and yellow.

Waxy or Amyloid Degeneration. See **DEGENERATION (IN PATHOLOGY)**.

Way, Arthur S., English classical scholar; b. Dorking 13 Feb. 1847. He was fellow of Queen's College, Melbourne, Australia; was classical lecturer in Queen's College, Taunton, in 1870-6, and was the head of the Wesley College of Melbourne in 1882-92. In 1897 he became examiner in Latin to the Central Welsh board of secondary education. His publications include English verse-renderings of the 'Odyssey' (1880) and 'Iliad' (i.-xii. 1886; xiii.-xxiv. 1889); of the tragedies of Euripides (1894-8); of Horace's 'Epodes' (1898); and of Apollonius Rhodius' 'Tale of the Argonauts'; and 'Letters of Saint Paul to Seven Churches and Three Friends' (1901).

Way, in fortification, a space left for the passage round between a rampart and the wall of a fortified place.

Way, Right of. See **REALTY**.

WAYCROSS—WAYNE

Waycross, wá'krós, Gé., city, county-seat of Ware County; on the Savannah, P. & W. and the Brunswick & W. (Plant System) and Waycross A. L. R.R.'s; about 95 miles southwest of Savannah. It has manufactories of naval stores, lumber, flour, and agricultural and lumbering tools. The two banks have a combined capital of \$100,000 and deposits of about \$300,000. The educational institutions are a high school (white), established in 1899, a high school (colored), and public and private schools. Pop. (1910) 14,485.

Wayland, wá'land, Francis, American college president. b. New York 11 March 1796; d. Providence, R. I., 30 Sept. 1865. He was graduated from Union College in 1813, studied in the Andover Theological Seminary, was a tutor at Union College 1817-21; in 1821 became pastor of the First Baptist Church of Boston, and took a leading place in the ranks of American preachers, his sermon on 'The Moral Dignity of the Missionary Enterprise' (1823) being particularly well known. After holding a professorship at Union (1826-7), he became president of Brown University. During the 28 years of his administration he greatly developed the institution, and was one of the pioneers of the elective system in American universities. Subsequent to his resignation (1855) he was for a year and a half pastor of the First Baptist Church of Providence, after which he devoted himself to various kinds of religious and humanitarian effort. He was the author of many valuable works, including 'Elements of Moral Science' (1835); 'Elements of Political Economy' (1837); 'Limitations of Human Responsibility' (1838); 'Domestic Slavery Considered as a Scriptural Institution' (1845); 'Elements of Intellectual Philosophy' (1854); and 'Sermons to the Churches' (1858).

Wayland, Francis, American legal scholar, son of the preceding: b. Boston 23 Aug. 1826; d. New Haven, Conn., 9 Jan. 1904. He was graduated from Brown University in 1846, took his M. A. degree from Yale in 1872, and began law practice in Worcester, Mass., in 1850, removing in 1858 to New Haven. He was judge of probate in 1864-5, and lieutenant-governor of Connecticut in 1869. In 1872 he became professor in the law school of Yale, and in 1873 dean of the school. In 1903 he resigned the deanship. The development of the school from a minor local institution to its present condition, with adequate financial basis and wide curriculum, is due chiefly to him. He was president of several organizations, including the American Social Science Association, the board of directors of the Connecticut State Prison, the Prison Aid Association from 1872, and the Organized Charities Association of New Haven from 1878. He was prominent as a writer and speaker on sociological and charitable topics and criminology, and was joint author, with his brother, H. L. Wayland, of the 'Memoir' of President Wayland (1867).

Wayland the Smith (Ger. Wieland, wé'lánt; Norse, Völundr; A. S. Weland), a hero of old Teutonic saga. His myth assumes numerous forms. It appears in Scandinavian, Anglo-Saxon, and German poems. The name probably signifies the 'skilful' or 'artful' one. Wayland seems to be a deification of the smith, whose calling was considered among the highest. Epi-

odes in the story narrate that Wayland was, like Vulcan, lame, and, like Daidalos, manufactured wings and could fly. These are thought, however, to have been late introductions from the classic mythology. In France, too, Galans the Smith was known. Simrock employed the various legends in his epic 'Wieland der Schmied' (1835). The megalithic monument in Berkshire called 'Wayland Smith's cave,' with the character Wayland, empiric, farrier, and pedlar, is familiar through Scott's 'Kenilworth.' Consult Maurus, 'Die Wielandsage in der Literatur' (1902).

Wayne, wá'n, Anthony, American soldier: b. East Town, Pa., 1 Jan. 1745; d. Presque Isle (Erie), Pa., 15 Dec. 1809. At 18 he became a land-surveyor. He was an intimate friend of Franklin, and early took an active interest in public affairs. Having married and settled to farming (1767), he was elected to the Pennsylvania convention and legislature in 1774, served on the committee of safety, and in 1775 raised a regiment, with which he took part in the campaign against Canada. He fought with distinction, and was wounded at the battle of Three Rivers 3 Jan. 1776; held Ticonderoga till May 1777, and after receiving the commission of brigadier-general joined Washington in New Jersey; led a division at Brandywine 11 September, and commanded the right wing and led the attack at Germantown 4 October. He made a dashing raid on the British lines in the winter of 1777-8, carrying off a great quantity of supplies, and on the night of 15 July 1779 achieved the most brilliant of the American victories in the storming of Stony Point, for which he received a gold medal and the thanks of Congress. He became a popular hero, and his nickname of 'Mad Anthony' was as much a tribute to his energy and valor as it was a denotation of his recklessness in action. By a bayonet charge he rescued Lafayette in Virginia in 1782; made a daring attack on the whole British army at Green Spring (6 July), and defeated the British and Indians in Georgia. On the surrender of Charleston, S. C., by the British it was occupied by Wayne, 14 Dec. 1782. He was made brevet major-general 10 Oct. 1783, retired from the army in 1784, and became a member of the Pennsylvania legislature. He was a member of the convention of that State which ratified the Federal Constitution in 1787. Later he settled on a Georgia plantation presented to him by the State in return for his military services; and from Georgia, in 1791, he was sent to Congress, but in a contest during the next year his seat was declared vacant. In April 1792, he was made commander-in-chief of the American army, with the rank of major-general. In 1793 he took the field against the Indians in Ohio, whom he finally defeated at Maumee Rapids or Fallen Timbers, and he forced them to conclude the treaty of Greenville (1795), which gave a large tract of territory to the United States. His death occurred while he was engaged in completing this service. A monument was erected to him at Waynesboro, Pa., in 1809. Consult the 'Lives' by Armstrong (1834) and Moore (1845); Wayne's 'Regimental Orderly Book' on the northern campaign, edited by J. Munsell (1859); Stille, 'Wayne and the Pennsylvania Line' (1893); Roosevelt, 'Winning of the West,' Vol. IV. (1899-94); and Spears, 'Anthony Wayne' (1903).

WAYNE—WAYNESSBURG COLLEGE

Wayne, Neb., city, county-seat of Wayne County; on the Chicago, Saint Paul, Minneapolis & Omaha Railroad; about 95 miles north by west of Lincoln and 85 miles northwest of Omaha. It is in an agricultural region, in which the principal productions are wheat, corn, sugarbeets, and potatoes. Wayne makes extensive shipments of grain, hogs, cattle, hay, and vegetables. It has Nebraska Normal College (private), a high school, and public graded schools. The four banks have a combined capital of \$230,000 and deposits amounting to about \$650,000. Pop. (1910) 2,140.

Waynesboro, wānz'bār-ō, Ga., city, county-seat of Burke County; on the Central Railroad of Georgia; about 100 miles northwest of Savannah and 30 miles south of Augusta. It was laid out as a town in 1783, and in 1888 was incorporated as a city. The chief manufactures are cottonseed-oil mills, wagon factory, agricultural implement works, and a cotton compress. It has seven churches, one public high school or academy, and Waynesboro Academy (a private high school), and elementary public schools. A battle was fought here during the Revolutionary War, and one during the Civil War. Pop. (1910) 2,729.

Waynesboro, Pa., borough in Franklin County, on the Mount Alto and West Maryland R.R.'s; about 48 miles southwest of Harrisburg. It is the commercial and industrial centre of quite an extent of territory. The chief manufacturing establishments are machine shops, creameries, ice-machine and engine works, plow factory. In 1900 (government census) Waynesboro had 61 manufacturing establishments, capitalized for \$3,084,774. The number of employees was 1,103, and the annual cost of raw material used in the manufactories was \$1,072,213; the value of the products (annually) was \$2,731,039. The borough is near South Mountain and Antietam Creek. The Confederate army passed through Waynesboro on the way to and from Gettysburg. Pop. (1910) 7,199.

Waynesboro (Va.), Battle of. On 27 Feb. 1865 Gen. Sheridan started from Winchester, Va., on his final campaign up the Shenandoah Valley, under instructions from Gen. Grant to destroy the Virginia Central Railroad, the James River canal, capture Lynchburg, if practicable, and join Gen. Sherman, wherever he might be found in North Carolina, or return to Winchester. He had Custer's and Devin's divisions of cavalry and two sections of artillery, about 10,000 officers and men, the whole commanded by Gen. Merritt, his chief of cavalry. At Mount Crawford, 1 March, he was met by Rosser's cavalry which was promptly dispersed, and 2 March he reached Staunton, which had been abandoned by Gen. Early, who had fallen back eastward to a ridge west of and near Waynesboro, where he could muster only Wharton's two small brigades of infantry, Nelson's battery of six guns, and Rosser's cavalry, in all not over 1,800 men. Merritt followed from Staunton, and late in the afternoon, after some artillery-firing, three of Custer's dismounted regiments moved around Early's left flank, between it and South River, while two of his brigades charged his front. Early's men made but a feeble resistance, and broke in a disorderly rout, hotly pursued by the Union cavalry through Waynesboro and as far as the South Fork of the

Shenandoah and to Greenwood Station, where five guns were captured and several loaded cars burned. Merritt took as prisoners 1,450 officers and men, and captured 11 guns, with horses and caissons complete, 200 loaded wagons, and several battle-flags. Gens. Early, Long, Wharton, Lilley, and Rosser, with a few men, escaped. From Waynesboro the prisoners and captured artillery were sent back to Winchester, under guard of 1,600 men. Early's army had disappeared, and Sheridan moved unmolested to the Virginia Central Railroad, which was destroyed for several miles. The swollen condition of the rivers made it impossible to join Sherman, and Sheridan determined to destroy still more thoroughly the railroad and James River canal and then join Grant in front of Petersburg. He divided his command, sending one part to the James River canal, which it destroyed as effectually as the other part destroyed the railroad. This done, he moved to White House on the Pamunkey River, where he arrived on 19 March 1865, and thence to the army in front of Petersburg. Consult: 'Official Records,' Vol. XLVI.; Pond, 'The Shenandoah Valley in 1864'; Sheridan, 'Personal Memoirs,' Vol. II.; Early, 'Last Year of the War for Independence'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Waynesburg, wānz'bērg, Pa., borough, county-seat of Greene County; on Ten Mile Creek and on the Waynesburg & Washington Railroad; about 44 miles south of Pittsburg. It is in an agricultural and stock-raising region, and in the natural-gas and oil belt. It has flour mills, a foundry, a planing mill, carriage factory, machine shop, and creameries. It is the seat of Waynesburg College (Cumberland Presbyterian). The five banks have a combined capital of \$675,000 and deposits amounting to about \$2,500,000. Pop. (1910) 3,545.

Waynesburg College, located at Waynesburg, Pa. It was chartered in 1850 and first opened to students in 1851. It was established by and is under the control of the Pennsylvania Synod of the Cumberland Presbyterian Church, and the trustees are elected by this synod. In 1902 the board of trustees was increased from 11 to 21 members, and the Alumni Association empowered to submit 12 nominations, from which 6 trustees shall be elected. The college for many years labored under serious financial difficulties, and it was not until 1898 that an adequate endowment was obtained, which was increased in 1900. Since that time the curriculum has been extended, especially in the study of the sciences, and the equipment greatly improved. The college offers three regular courses, classical, literary, and scientific, which lead to the degrees of A.B., B.L., and B.S. Greek is required for the A.B. degree. These courses all include some electives in the work of the last two years, the list of electives from which the student may choose differing in each course. The degree of A.M. is conferred for graduate work; courses leading to the Ph.D. degree have been discontinued. In addition, the college maintains a preparatory department, a normal department, a conservatory of music, and a school of oratory. The college adopted the system of co-education at the first, and has found it most successful. The students maintain two literary societies and a Young Men's and a Young Women's Christian

Association. The buildings include the main building and Hanna hall, a dormitory. There are well-equipped chemical and biological and physical laboratories, recently established. The library in 1910 contained 6,535 volumes, and the productive funds amounted to \$75,000. The students numbered 325, and the faculty 14.

Ways and Means Committee. See FINANCE; SEMATS, U. S.

Wazan, wā-zān', Morocco, an inland town, picturesquely situated on the steep northern slope of a two-peaked mountain, in the hill country 90 miles southeast of Tanger. It is a sacred city of refuge, and a place of pilgrimage, the headquarters of the grand shérif, the spiritual ruler of Morocco. The principal buildings are the great mosque and the tombs of a long line of shérifs. The trade is, as elsewhere in Morocco, mainly in the hands of the Jews. Pop. 20,000. Consult Watson, 'A Visit to Wazan' (1880).

Waziristan, wā-zē-rī-stān', the country of the Waziris, Northwestern India, a mountainous region situated west of the Suliman range, north of British Baluchistan, and east of Afghanistan. It is now partly included in British India, and has at various times been the scene of military operations owing to the depredations and raids of the Waziris on the caravans traversing the Gomul Pass. It is a mountainous country, with much fine scenery, and a delightful climate except in some of the valleys. The Waziris, a portion of whom are known as Mahsuds, are a hardy race of Afghans. It is estimated that they number about 44,000 fighting men. Some of them have settled peaceably within British territory, where they cultivate 27,000 acres and pay a revenue of \$4,500. Their crops are wheat, maize, and barley; they raise horses and sheep, and iron and wood are exported.

Wea (contraction of *Wayutasaki*, "Eddy people"), a tribe of the Algonquin stock of North American Indians, belonging to the Miami confederacy. When first known to the whites, in 1672-1703, they were in Wisconsin, but they seem to have gradually drifted southward, and in 1701 one of their villages was on the site of the present Chicago, Ill., and in 1719 their chief village was on the Wabash below the mouth of Wea Creek, in Indiana. They were hostile against the whites in western Virginia, in which their country was situated, but they finally signed the celebrated treaty of Greenville in 1795, and in 1820 sold their last lands in Indiana and moved with the Piankashaws to Illinois and Missouri. In 1832 they again sold their lands and the main body moved to Kansas, whither a few of their number had already migrated. In 1854 the rapidly decreasing Weas and Piankashaws united with the Peorias and Kaskaskias of the Illinois confederacy; at this time their population aggregated 250, largely mixed-bloods. In 1868 they moved to the Neosho in Indian Territory, where they have since remained. The Miami number 110 and the Peoria 185, but the population of the Weas is not separately recorded.

Weakfish, or Squeteague, a spiny-rayed fish of the genus *Cynoscion* and family *Sciaenidae*. It has no teeth on the vomer or palate bones, but numerous ones in the jaws, one or two in the front of the upper jaw, having the form of

elongated canines; the head is convex, supported by cavernous bones; the air-bladder has a horn on each side projecting forward. The genus is chiefly American, with about 15 North American species. The common weakfish (*C. regalis*) is 1 to 2½ feet long, brownish blue above, with irregular brownish spots, and tinged with greenish and banded in the young; the sides silvery, abdomen white, and iris yellow; lower fins orange; a single row of very small teeth in the upper jaw, and a double series in the lower; dorsals separated, and the second, with the caudal and anal, mostly covered with scales. This is one of the most abundant fishes along the entire Atlantic coast from Cape Cod to Florida, but there have been times when the invasions of bluefish have driven them from parts of the coast. The name originated from the little resistance it makes when taken, and from the ease with which the delicate structure of the mouth enables it to break away. This is the name most employed on the New Jersey coast, while in New England the Indian name "squeteague" is usual, and in the South sea-trout is applied to this and to the spotted *Cynoscion*. On the New Jersey coast it appears early in the spring, being most abundant toward the end of July, and disappears late in the autumn; it is a greedy biter, and is easily taken by any soft white bait, affording great sport for about an hour on the flood tide; it swims in shoals near the surface, and requires a line slightly if at all leaded. In summer it is abundant about the mouths of rivers, where the water is brackish, and sometimes ascends far up, having been taken in the Hudson above Sing Sing; it is taken by seines and pound-nets in large quantities; when caught it makes a croaking sound, also heard when the fish is at the bottom. The flesh is wholesome and well flavored, but so quickly gets soft that it does not rank high in the market. The air-bladder makes excellent isinglass for culinary purposes. The spotted weakfish (*C. nebulosus*) is conspicuously marked with round black spots above and the soft-dorsal fin is not scaly. It is more southern than the squeteague, and is sometimes called spotted trout. Other related species occur in West Indian waters and on the Pacific coast.

In 1901, 23,496,383 pounds of weakfish, valued at \$558,653, were taken in the fisheries of the Middle States, Maryland, and Virginia, and in 1898 the New England States yielded 4,691,188 pounds, worth \$108,945.

Wealden, wēl'dēn, the name given to certain delta-deposits of the Cretaceous (or Chalk) system, from their great development in the weald of Sussex, England. Weald means in Old English a wood or forest, and the name is applied to a tract of country lying between the north and south downs of Kent and Sussex. The recognized geological name of this subdivision of the Cretaceous system is the Neocomian, from the old Latin name of Neuchâtel in Switzerland. This stage in the south of England, and thence eastward across Hanover, consists of a mass of sand and clay, sometimes 1,800 feet thick, representing the delta of a river. Only a portion of this delta remains, but as it extends in an eastern and western direction for a distance of at least 200, and from north to south less than 100 miles, its total area may have been 20,000 square miles, indicating a very large river. The stream not improbably descended

WEALTH—WEASEL

from the north or northwest. It carried down the drifted vegetation of the land, with occasional carcasses of the iguanodonts and other terrestrial or amphibious creatures of the time. Beyond the area overspread by the sand and mud of the delta, the ordinary marine sediments accumulated, with their characteristic organic remains. From Yorkshire, England, they stretch eastward through northwestern Germany, and are found at the base of the Cretaceous system through France into Switzerland. See **GEOLOGY**.

Wealth, in political economy, a term applied to all objects possessing value. Such objects are defined, in general, as useful, transferable, and limited as to supply. There is some confusion regarding the sense in which the word is employed by various authors, but standard usage limits the term to external objects, excluding all personal attributes. Wealth is frequently confounded with money. See **POLITICAL ECONOMY**; **VALUE**.

Wealth of Nations, An Enquiry into the Nature and Causes of the, a famous work by Adam Smith, published in 1776. It is a treatise especially designed to show the wisdom and justice of free trade among nations, and forms the foundation of the modern science of political economy. The style of the work is diffuse, and to a very large extent it drew from the work already done in France by the economists of the "Encyclopédie" school. Five English editions of the work appeared during its author's life, and it was translated into many modern languages.

Wealth of the World. The total wealth of the world, while not exactly known, has been estimated at \$500,000,000,000. This is probably an underestimate of the actual amount of money and property in civilized and semi-civilized lands. Of this total, the greater part is owned by Americans and Europeans. The United States has somewhere near \$100,000,000,000, or about one fifth of the whole. Among foreign nations the total wealth has been estimated as follows:

Great Britain	\$50,000,000,000
France	48,000,000,000
Germany	40,000,000,000
Russia	32,000,000,000
Austria-Hungary	27,000,000,000
Italy	16,000,000,000
Spain	12,000,000,000
Scandinavia	7,000,000,000
Belgium	5,000,000,000

The percentage of public debt per capita of European countries has been estimated for 1909 as follows:

COUNTRIES	Population	Debt per capita
Austria-Hungary	50,400,000	\$21.6
Austria	29,824,000	32.2
Hungary	20,575,000	55.4
Belgium	7,452,000	89.8
Bulgaria	4,221,000	22.5
Denmark	2,692,000	25.9
Greece	2,632,000	60
Holland	5,225,000	77
Italy	34,370,000	76
Norway	2,330,000	98
Portugal	5,423,000	15.9
Rumania	6,772,000	41.5
Servia	2,825,000	36.6
Spain	19,713,000	22.2
Sweden	5,378,000	25.7

The total wealth per capita of various countries is as follows:

Great Britain	\$1,442
France	1,337
Germany	799

Russia	\$ 296
Austria-Hungary	499
Italy	485
Spain	548
Belgium	739
Portugal	417
Greece	485
Australia	1,228
United States	1,125
Denmark	1,704
Canada	949

Weaning, the accustoming of an infant to food other than its mother's milk, or the disengaging of a child from the habit of nursing. In normal cases it is now deemed desirable to continue nursing for nine or ten months after birth. With children who are healthy, and cut their teeth early, weaning may begin earlier than with weak, sickly children. It should never be attempted during sickness, nor, unless absolutely necessary, in hot weather. It is best for both mother and child to bring it about gradually. By so doing the secretion of milk in the former is slowly diminished, and those complaints which arise from sudden weaning are prevented; while the child is gradually accustomed to other kinds of sustenance, and the restlessness and want of sleep, which are so troublesome in sudden weaning, are avoided. Both during the weaning and for some time after it no food should be given to the child except what is very easy of digestion, and more fluid than solid, and in particular what has no stimulating qualities, nor any that will tend to create acidity, or produce other marked changes in the organic functions. See **INFANCY**.

Weare, wär, Meshech, American colonial leader: b. Hampton Falls, N. H., 16 June 1713; d. there 14 Jan. 1786. He was graduated at Harvard in 1735; studied theology and entered the ministry, which he gave up for the practice of law; was repeatedly sent to the legislature, and in 1782 was speaker. His later appointments included that of commissioner to the Albany Congress (q.v.) in 1774, justice and (1777) chief justice of the superior court of judicature. He was also colonel of a militia regiment, and when the Revolution opened was appointed chairman of the Committee of Public Safety. Upon the reorganization of the State judiciary he was placed at its head. He raised troops for defense against Burgoyne, whose invasion he materially aided in repelling. In 1776, under the temporary constitution, he was elected president of the State, and was annually re-elected until 1784. Under the new constitution he was again elected president, but resigned before the expiration of his term.

Weasel (*Putorius noveboracensis*), a fur-bearing mammal (q.v.), typical of the family *Mustelidae*. The body is elongated and slender, the head long, the legs short, the muzzle rounded and the tail short and slender. The feet have each five toes and are digitigrade and unwebbed. There are 34 teeth and the sectorial or flesh-tooth lacks an internal tubercle. The anal glands are developed and secrete a strong-smelling substance. The weasel attains a length of from 12 to 15 inches, of which the tail makes nearly one third. The male is larger than the female. Above the color is brown, below white or pale yellow, the terminal one third of the tail black. In winter the fur becomes more or less white, but this change is complete only in the north and does not affect the black of the tail; in this white phase the animal is called an

WEATHER BUREAU — WEATHER MAPS

ermine (q.v.). The common weasel, in one or other of its varieties, inhabits the entire eastern United States, westward to Minnesota, south to North Carolina and north to Canada; and is replaced in most other parts of North America by more or less closely related species and in Eurasia by others, of which the Siberian ermine is its nearest ally. Owing to its retiring and nocturnal habits it is often, quite unknown to most people, plentiful even in the vicinity of large cities, where it renders efficient service in the destruction of vermin. The weasel is a highly courageous animal, and makes war on rats, mice, hares and rabbits, birds, and many other small animals. During the summer it devours insects, but appears never to partake of a vegetable diet. Many instances are on record in which these animals have spontaneously attacked horses and cows, and they seem nearly at all times to exhibit an utter indifference to the proximity of man. They are especially fond of eggs, and rob hen-roosts and the nest of every wild bird which they find. Their mode of killing their prey is characteristic—since they usually fasten on to the neck of their victim, and hold firmly on while they suck the blood; next they eat the brains and only then the flesh. Like most of their near relatives they often kill much more than they require for food. They hunt by scent and are tireless in pursuit. Few animals are so active, and the slowness of their bodies enables them to explore every hole and hiding-place of their prey. Weasels live in holes under stone walls, rocks and trees, in burrows captured by force from ground-squirrels and woodchucks, in hollow stumps, etc. A nest of dried leaves and grasses is constructed and about five young are born in a litter. Consult: Coues, 'Fur-bearing Animals' (Washington 1877); Merriam, 'Synopsis of the Weasels of North America' (Washington 1896).

Weather Bureau, United States. See **Meteorology.**

Weather Maps. Meteorology has, of late years, made rapid progress. In 1870 the United States established its Weather Bureau for gathering the facts that pertain to this branch of science. We were not the first, or the original promulgators of the present system, but we were the first to establish the system upon a grand basis, by which we have accomplished such satisfactory results. Our extended territory is most favorable. The main portion of the United States, covering in round numbers, an area of 3,000 miles from west to east, and some 1,500 miles north and south. The first maps were crude affairs, but gradually the improvement and perfection came. At first, on the map, the two grand centres or factors high and low were not tracked. They were simply indicated. After a while it was seen that there was a movement of these factors of high and low barometer, from the west toward the east, or contrary to the movement of the sun. "Barometer" being a long word, on the map it is not used, but it is the while understood. When the word high is used it stands for high barometer, and when the word low is used low barometer is understood. So the terms high and low have come to stand for high and low barometer. High is a cold, dry factor, and cold in proportion to its intensity, while low is a wet factor, and cold or warm in proportion to its latitude.

The movements of these factors high and low are from the west toward the east—on general lines. At first the term "general lines" may seem like a loose method of referring to these factors, but when we come to understand the subject, we readily see that this term "general lines" is most appropriate and definite; there is nothing loose as to thought in this term. The highs and lows enter somewhere in the west—south or north—and travel toward the east; at times much after the manner of a vessel at sea, against a head wind, tacking, in order to reach a certain point to the windward. These highs and lows do not tack, but they often take similar lines; hence the reference to this detail of navigation in order to illustrate the lines that these factors take in their course over the country and around the world. There are four general points at which the lows enter, and one general point at which they pass off the Atlantic coast toward the east. Which the superior factor? it may be asked. The reply is, neither—one is as much the superior as the other; they are parts of one stupendous system, whereby nature re-animates and invigorates the atmosphere of our earth. We speak of the lows first because they are the storm centres; yet the highs likewise perform their part; they furnish material that is an essential feature of the storm. The two work together and produce all the changes that come under the head of what we so commonly call our "Weather System." The lows enter the territory of the United States at four different points. But it must not be assumed that these points are always the same, and that they are like the great gates of the ancient city. One point of entrance is in the extreme Northwest, in the neighborhood of Puget Sound, and the other, or the one we may call the second, is in the Southwest, at the head of the Gulf of California. The third, we first find on the borders of the Gulf of Mexico, and evidently comes up from some point on the lower Pacific coast of Mexico. When our system is extended so as to cover Mexico, as the United States is now covered with stations, we shall be in position to determine the course of these lows before they enter our territory. From this direction they evidently come. The fourth set are first revealed to us when they make their appearance in the southeast of the lower coast of Florida. These lows, coming from this southeastern quarter, may at first cause some doubt as to the course of the storm, but when we come to study the system, as now revealed to us, there will be seen to be no inconsistency in the statement that the general movement is from the west toward the east. When we come to have our system of stations established through Mexico and the West Indies, what we arbitrarily term the third and fourth, may be one and the same, or this fourth may be an independent centre, coming up from the Spanish Main. As to these two herein designated as the third and fourth, we must at present, in regard to them, remain in darkness. This darkness, though, should at once appeal to the scientific world to plead for the essential stations through Mexico and the West Indies. In time we evidently shall have stations all over the world; then we shall have a weather map that will enlighten us as to the system of the whole. We cannot study the tidal system of the earth in a mill-pond, nor

WEATHER MAPS

even in the greatest of inland seas. We must have access to the oceans of the world. So with meteorology, we cannot study the beautiful system in a small or circumscribed territory. We must have an extended territory, and the more extended the better the results. The lows that enter at the northwest gate sometimes from this point travel due east—toward the Great Lakes and along the St. Lawrence Valley, to the Atlantic Ocean. At other times they will, from this point of entrance, travel toward the southeast, even down to the mouth of the Mississippi, and from there take a course toward the northeast, leaving the Atlantic coast at about the same point as the one that took the direct course toward the east. The low that enters at the southwest, also may go on a line as nearly east, until it reaches the vicinity of the mouth of the Mississippi; then from this point it may travel toward the north and join the low that came from the vicinity of Puget Sound; or it may move along the shores of the Gulf States, even as far as the Atlantic seaboard, then move northward toward the banks of Newfoundland. The third or the low from Mexico often takes a similar course, after it has reached the mouth of the Mississippi. But those from the West Indies are probably the most erratic, and more than any other set of lows they, at times, for considerable distances, will travel along a line that is quite contrary to the general direction. The one that in 1902 produced the great and terrible storm at Galveston was of the most erratic character. It came up from the West Indies, and was first revealed to us off the lower coast of Florida, that is, within the lines of the United States. From this point, instead of going toward the northeast, as do the greater number of these storms, for 24 hours it traveled due west, covering the distance of some 1,100 miles in 24 hours—an erratic direction and a phenomenal speed. On an average the lows travel from 300 to 400 miles a day, but here was one that traveled 1,100 miles in one day. Why? it may be asked. If the reader will consult the map of the day on which this storm first appeared off the lower coast of Florida, he will see that an extensive high covered the territory of the southeast section of the United States, which was like the great mountain that at times turns the direction of a stream. Because of the location of that high, the low could not pass toward the north, so it must take the direction of the least resistance, and that was toward the west. It had a clear field; there was nothing in its way. It flew across the Gulf from the east toward the west. Then it turned toward the north, veering more and more toward the northeast and joined the path of the lows that pass off the coast at Newfoundland. So while its direction was for a while toward the west, its general direction was toward the east. One thing that has operated against meteorology is the fact that the courses of the lows and highs are so peculiar, as is also their speed. So by some it is not regarded as an exact science. If the movements of the highs and lows could be worked out by some process of arithmetic, or even the higher mathematics, then a certain class would have more interest in it. But we must take nature as we find it. It is a fact that the highs and lows do travel as they do. We cannot change this; the laws that govern them must stand.

From fall to spring the greater number of the highs that enter the Pacific coast centre on Cape Mendocino, and this accounts for the peculiar climate of the Pacific coast; as there is the while the central high and the low to the north and the low to the south of it. Having knowledge of this, we readily understand the peculiar climatology of the Pacific coast. Then if we will study the map and see the course of the majority of the lows that travel across the country, it will not be difficult to understand the climatology of the eastern section of the United States. Indeed, without the knowledge we obtain from the weather map, it is not possible to understand the climatology of any section. With this knowledge, all that comes under the head of climatology is exceedingly easy to comprehend. Until we had the weather map, the so-called "Texas norther" was a mystery; now the explanation of this phenomenon is as plain to us as why the locomotive moves over the land or the steamship over the seas. When the conditions occur that produce the "Texas norther" the map reveals to us that the high that entered at Cape Mendocino, instead of moving directly east, or toward the northeast, moved toward the southeast and covered the territory of Texas, and later the territory of the Gulf States.

It was one of these highs that a few years ago was so destructive to the orange trees of Florida. Let it be borne in mind that the wind is always from the high toward the low; not in a direct, but in a curved line; for the reason that low is the centre toward which the winds move. The winds from the four points of the compass, north, east, west, and south, must come together at this point, or the centre low, and as they approach the centre these winds necessarily react upon each other and deflect each other toward the right, as we face the centre of low. So the term "general" as to the winds is as pertinent as is the direction of the factors high and low. The highs and lows travel on general lines from the west toward the east; the winds travel on general lines from the high toward the low. Before we had the weather map to throw light on this subject there was much crude thought about the movement of the winds. It was often stated that the winds moved over the surface of the earth in epicycles, and even to this day persons who have not heeded the lessons taught by the weather map claim that the winds during the fierce storm travel in epicycles, and to these storms they have given the name "cyclone." The weather map relegates the term "cyclone" out of the list of words—it is a misnomer. And yet, when the fierce hurricane or the fierce summer local occurs, and evidence is found of objects along the path of the storm being twisted about in a most erratic manner, the supposition of the past was that the winds moving in epicycles produced this effect. But such is not the case. Water rushing down a steep incline does not take such a course. From time to time it may meet with some firm object like a great rock, and thereby an eddy or whirlpool may be caused, but if the obstacle was not in the way the water would flow on its course, and the course would be as straight as the nature of the valley or incline would permit. So with the winds. Winds that are moving at the rate of from 50 to 100 miles an hour do not stop to

WEATHER MAPS

take epicycles. In the summer-local the wind moves along a very narrow path, and after moving a short distance becomes, as it were, a thing of life, and often assumes a huge serpentlike shape—a bolt moving over the surface of the earth. If there is nothing in its way it moves along on a straight line. But if there is some firm object in its course it may be deflected, right, left, or over, as the case may be; it may pass over some objects, while others it will hit and send them rapidly whirling off toward the right or left, depending upon which side the blow from the bolt is given. Then in this connection of late there has been intimated, evidently from European sources, the term "cyclone and anti-cyclone." By the "cyclone" agent or power they mean the low that causes the fierce winds to rush toward it; to the high, which is the magazine of the airs that rush toward this low centre, has been given the name "anti-cyclonic." Might as well call a hill an anti-valley. At times some persons ask, why should the highs and lows move as they do, and because they cannot understand the why, they take little interest in the subject as a whole. No more than any other medium can the weather map explain the first cause, but it can, if we will properly study it, lead us up as near to the first great cause along its line as can any other medium along any other line of science. In all departments of nature there are facts that we must accept, whether they do or do not make clear to us all the mysteries of cause and effect. There is one thing certain, the more facts with which we are familiar the greater our chances for comprehending the laws that govern all departments of nature. To be indifferent in regard to obtaining facts, and then to be indifferent and even to condemn such labors as lead up to the better interpretation of nature and nature's laws, seems most absurd. And yet this is the position of many. Because we cannot, at present at least, tell what is the cause and why the peculiar action of these two factors high and low, they refuse to take interest in the subject as a whole. In all departments we sooner or later come to the point where we must fall back upon theory. While this is not final it oftentimes serves as a provisional structure that later on leads up to grander results.

Why should high and low have the characteristics peculiar to them? Where facts fail to reveal any further light it is then well to resort to theory, and in plausible theory there is often much satisfaction. There is no better way for a plausible theory as to low than in imagination to put ourselves back at the very beginning, when the sun began to shine upon the earth and to cause it to revolve. It could not turn in but one direction, and it might as well turn or revolve in one direction as the other. The Grand Architect of the Universe evidently saw fit to have it turn on its axis as it does—toward the east. Possibly there would be no difference in the conditions that follow, whether it turned east or west. It must turn toward the sun. When the earth first began to move some one point, or a belt of centres, became the point or points where the heat of the sun was concentrated; much like the action of the double-convex lens that is so commonly called a "sun-glass." The heat of the sun acting upon the waters of the earth produces clouds. At the point of concentration there is, on the part of

nature, an attempt, at least, to produce a vacuum which causes a movement of the surrounding airs toward that point. Soon the direct heat of the sun is shut off from this point. The while the earth is turning and another and another point is exposed to the concentration, and so on until the circle of the earth is complete. Toward these points of concentration, designated by the term low, the surrounding airs are brought. The propelling force, we term the winds, is the result of the concentration at low. After reaching these points, the airs becoming heated, ascend, to a point a number of miles above the earth, where they take the lines of the boiling water in the pot—convection. These heated airs spread outward from the centre in all directions. As the atmosphere at these higher altitudes is cold, the coldness is gradually imparted to these warmer airs that have ascended to this high elevation. Becoming cooled, they lose their buoyancy and therefore descend. By heat they have ascended; by cold they descend, and where they descend they build up heavy banks of pure airs, airs containing a minimum of moisture; and these points become great magazines of pure air, and we designate them as highs. So all over the world are the lows and the highs. On the surface the movement of the airs is from the high toward the low; above this it is reversed, the movement being from the low toward the high, which readily accounts for the direction of the light cirrus clouds, at times seen moving along a line directly opposite from the movement of the winds at the surface of the earth.

So the weather map has even a wider and deeper or higher revelation than at first it appears to have. It becomes a veritable Jacob's ladder that connects that which is below with that which is above. It reveals to us the motion of the atmosphere above the earth, as well as the movement along the surface. Then if we will go a little further in our investigation, it reveals to us how nature makes or produces electricity, and how simple are the elements and the process. First, we start with the heat power of the sun acting upon water. This causes what is called evaporation, which is simply so much water combining with so much heat, whereby miniature globules or balloons are produced. Herein is the heat and water, which in due time reaches the condition or form of force which we designate as electricity, which is a subtle yet powerful product of heat that comes from the relatively north low. The wind being from the high toward the low, when low is to the north, say moving along the line of 50° N. L., all to the south thereof will be warm because of the south winds, which are by this north low being brought toward the north. The clouds cover the point low, but the heat power of the sun shines upon the upper side of these clouds, thereby super-heating them. As the heat power at low increases, the clouds are not only brought there in greater masses, but in combination with the heat and friction the explosion of the confined gases takes place; a noise that we term thunder is produced, and the confined heat, now highly intensified, escapes. This we term lightning, and the whole process is termed electricity. So we often hear the term "electric storm." In one sense it may be a storm of this character, but in reality it is only the sub-result of a storm. It does not always accompany the storm, nor

WEATHER MAPS

even all sides of the same storm. To the south of the centre, at times it will be present, while to the north of the centre it will be absent. What is known by the name "thunder storm" is far more frequent in the warmer than in the colder months. In the colder months even the north low will not produce this peculiar storm condition.

There are two classes of storm, the general storm and the local. The general storm is where the precipitation takes place over a wide area, from 500 to even 1,000 miles in diameter. The local is peculiar to the warmer months, and is called local for the reason that it takes place at points here and there, to the south of the main storm centre. These are of a more fierce nature than the general storm. They don't last long, sometimes less than an hour. But there is no need here to say how long they last, for that is something patent to all, and the public as a rule does not care to be told something about which, without effort, they know so much.

The hurricane is a fierce general storm, where the barometer is very low, reaching a point of 28 inches pressure. The tornado is the fierce local storm. In winter there is a much greater difference between the pressure of the high and the low than in summer. In the winter the high will, even in northern sections, reach a pressure of 31 inches. But generally, through the central portions of the United States, say, centering upon the line of 40 N. L., the pressure will be 30.7. This will be a great pressure and will produce intense cold. A winter low will often be 29.4 and at times as low as 28. During the winter months over the area of the United States there is often a difference of three inches, while in the summer the normal difference will not be more than 30 many tenths; that is, the low will be 29.9 and the high 30.2. At times when a severe storm is raging the low pressure may go down to 29.4. But ordinarily during the summer months there is very little difference between the pressure of these two factors.

It is often asked how far ahead can we prognosticate the weather. There are men claiming their ability to forecast the weather for months ahead. If one will study the weather map and see the variety thereon revealed, the various shapes that the highs and lows take, their peculiar and oftentimes surprising course, he will not be apt to have much confidence in anyone's claim for forecasts, say, beyond four or five days. There are times when it is easier to predict what will be for four or five days in advance than at other times to predict with any certainty beyond 24 hours or for that minor part of time. If the map is regular, that is, well defined and extensive highs and lows, we may safely forecast the weather for a number of days, perhaps a week. But the first thing we know, there is a change in the conditions. Instead of there being a few well-defined lows and highs, the atmosphere is all broken up into a number of small areas, thereby making the problem of prognostication far more difficult.

In order to produce the changes in our meteorological system, heat is required; there is not sufficient heat in the moon to produce the necessary effect—only the heat power of the sun is sufficient for the purpose. In the colder months the gradients or lines of equal barometric pressure are much nearer together than dur-

ing the warmer months, and if one will become familiar with this it is a good and concise way of describing the weather. The gradients are near or far apart, as the case may be. It will be found to be a very expressive term. In the northern States, that is, States, say north of 40 N. L., most all of the passing lows in the cooler months produce snow. At times there may be a succession of north lows, whereby the atmosphere is heated to such an extent as to cause the precipitation to be in the form of rain rather than snow. But during the winter months, the highs being so intense and following the lows, the atmosphere has little opportunity to become heated, so that from the passing low there is snow rather than rain, but in the States midway between the north and the south line, say, below 40, where there is oftentimes much snow, the precipitation in this form in winter is only from a low that is passing along a line from the Gulf States toward the north. In this southern section the north lows cause rain rather than snow. The low in the south causes the north wind in that quarter, and the north winds in winter are sufficiently cold to cause the precipitation to be in the form of snow. At times as far south as New Orleans they have snow, but only when the juxtapositions of the highs and lows are favorable. In the midway States the storm often commences with snow and ends with rain, for the reason that the low that has brought the storm or snow is the while traveling toward the north, and this being the case the south winds that follow in the wake of the low so increase the temperature that rain is apt to follow or the snow soon to melt.

In discussing the weather problem some writers have made the statement that it would seem that it was full time that the wise men in this department should, ere this, have discovered some way by which we can control or regulate the weather, and by their remarks imply that those who know so much about the weather must be wanting in their knowledge of the subject, or in the practical application thereof, because they have not thus far been able to even suggest any plausible plan whereby to control the weather. Claims have been made for some men that they have by various mechanical appliances in miniature produced rain, and have by bombarding the sky caused precipitation. To those unacquainted with the revelations of the weather map this seems plausible. But their miniature performances, within some enclosed apartment, is of no value, and as for bombarding the sky it was a few years ago extensively tried and failed—failed even when a low was passing very near the locality of the firing. In their plan they did not consider the fact that there was no moisture to speak of within an area of high or the clear sky centre. In order to regulate the weather the first thing to do would be to regulate the sunshine; the next step to cause the earth to reverse its direction and change its path. The third step would be to regulate the highs and lows, where and how they shall enter the territory of the continent, the lines on which they shall travel, the outlines of the gradients, and the contour of the centres of the highs and lows. After they have succeeded in doing this, then they may be in position to develop some plan whereby they may think it pos-

WEATHER.

A delicate mechanism in the Weather Bureau, Washington, D. C., which records sunshine, rainfall, wind, approaching storms, etc.

WEATHER SIGNALS

sible to carry out their ideas along this line. But they must first change and remodel the whole face of nature.

While low is the storm centre, that is, the centre that causes the winds, and thereby concentrates the clouds, the precipitation does not always take place at this centre, but oftentimes before it reaches the centre, or about midway between the high and the low. When the clouds become sufficiently heavy they precipitate and do not wait until they have reached the centre. The centre is the active agent in bringing them toward a central point; sometimes they pass on to the centre, and other times they do not, and when they do not there will even be no rain at the centre that has been the means of bringing the clouds toward that point. In the fall of the year we have a number of weeks of fine weather—cool, yet not severely cold—cool nights and perhaps frosty mornings, but during the day it will be mild, hazy and even smoky. The conditions that produce this effect may graphically be described under the head of gradients far apart—moderate and extensive areas of high and low, with the low to the north, say on a line of 50 N. L., and the moderate high covering the area of the Southern States, say to the south of the old Mason and Dixon's line. This phenomenon, under favorable conditions and slight variations, also produces the fine atmospheric effects, that come under the head of "red-sky" morning as well as evening.

The high produces the clear sky, with a minimum of moisture, and the north low produces the warmth, or moderate heat, for reason of the south winds. This fall condition, with the gradients far apart, gave rise to the beautiful and ideal term "Indian summer"; and as the mild winds were from the south, the "Sweet Southwest," with the Indian became an ideal of a glorious condition which they thought, in some mysterious way, to be associated with the locality whence the balmy breezes came. They did not know, and we did not know until we had the weather map, that those balmy breezes from the south are caused by the gentle low far to the north. So the "Indian summer" is a happy combination of the more delightful northern and southern forces in the fall of the year, when the gradients are far apart.

The term "equinoctial storms" seems to be difficult to eradicate. But, if at the seasons of the year when these storms are supposed to occur, one will consult the weather map, he will see that it does not then indicate, over the whole country any extraordinary condition of the highs and lows. At the time of the vernal and autumnal equinox there may be a low coming up from the West Indies, or from Mexico, traveling toward the northeast; if so, it will produce a storm along the Atlantic coast. But the lows that produce these storms often approach and pass without regard to the position of the sun in the ecliptic. If there was any truth in this old idea, then there should at these times, be some peculiar condition of the factors high and low, whereby there would be a general storm all over the country, and not merely a local disturbance along the coast. What gave rise to this belief is evidently the lows that, during the spring and fall, come up from the South, and at times produce the severe storms along the Atlantic seaboard. But there is nothing regular or general about these storms.

Sometimes we have them along the Atlantic coast and sometimes not, and as to time, they have no connection with the sun "crossing the line." Without regard to the vernal or autumnal equinox the highs and lows move over the country in their peculiar way, and they have no respect for special points in the equinox, or even for "sun-spots," the moon, or the conjunction of planets. For the so-called "equinoctial storm" there is no foundation, and it has no connection with scientific truth. This idea had its origin in older times, before we had the facts in the case, but the facts as now known place the whole subject of the weather upon an entirely new basis.

While on the land the paths of the lows are very irregular, and oftentimes take a zigzag line; on the ocean they seem to travel on very straight lines. Their course on the land is evidently due to the irregularity of the earth's surface—hills, valleys, and water in the form of lakes and rivers; while on the ocean it is all one condition practically—one great extensive plain of water, or only one element. Then on the ocean we have not the essential stations that we have on the land, therefore it is not so easy to be exact in our observations. The storms over the ocean are tracked by the observations made upon the great ocean steamers that ply between Europe and America. From the evidence of their "logs" the data are formulated, and the tracks of the storms laid down.

The statements herein made are based upon the observations made in the northern hemisphere. Up to date no such observations have been furnished by the southern hemisphere. But from what we know of nature, the same laws that govern one hemisphere must govern the other; though to the south of the equator, the polar or cold winds are reversed. There, the south winds must be the cold ones, while the winds in that hemisphere from the north must be the warm ones. Otherwise we think that the conditions must be the same. If we desire to know anything, and all, about the weather, the weather map is the only source. On this wonderful illuminator are revealed all the phenomena connected with what we term the weather. By this map and by it alone, can we comprehend the mysteries in the department of nature that we class under the head of Meteorology.

ISAAC P. NORRIS,
Washington, D. C.

Weather Signals. In the United States Weather Bureau, are signals for announcing the approach of storms. They are as follows:

A cautionary signal (displayed only at stations on the Lakes).—A red flag (eight feet square) with white centre (four feet square) indicates that the winds expected will not be so severe but well-found seaworthy vessels can meet them without danger.

A storm signal.—A red flag (eight feet square) with black centre (three feet square) indicates that the storm is expected to be severe.

A red pennant (five feet hoist and 12 feet fly) displayed with the flag indicates east winds—that is, from northeast to south, inclusive, and that the storm centre is approaching.

A white pennant (five feet hoist and 12 feet fly) displayed with the flag indicates west winds—that is, from north to southwest, inclusive, and that the storm centre has passed.

When red pennant is hoisted above cautionary or storm signal, winds are expected from the northeast quadrant; when below, from the southwest quadrant.

When white pennant is hoisted above the cautionary or storm signal, winds are expected from the northwest quadrant; when below, from the southwest quadrant.

Night signals.—By night a red light will indicate

WEATHERFORD—WEAVING

and winds; a white above a red light will indicate west winds.

The Information Signal consists of a red pennant and indicates that the displayman has received information of a storm covering a limited area, dangerous only for vessels about to sail to certain points. The signal will serve as a notification to shipmasters that important information will be given them upon application.

Weatherford, weth'er-fôrd, Texas, city, county-seat of Parker County; on a branch of Trinity River, and on the Gulf, C. & S. F. (Atchison, Topeka & Santa Fe), the Weatherford, M. W. & N., and the Texas & P. R.R.'s; about 65 miles west of Dallas. It was settled in 1850 by persons from east Texas and the older States. In 1856 it was incorporated, and in 1858 chartered as a city. It is in an agricultural and stock-raising region; wheat, cotton, and corn are among the principal productions. In 1900 (government census) the city had 83 manufacturing establishments. The chief manufactures are oil mills, cotton mills, cotton compress, ice factory, machine shops, and the light-plant. There are 10 churches. The educational institutions are Texas Female Seminary (Cumberland Presbyterian), Weatherford College (M. E. South), a high school, established in 1885, Saint Joseph's Academy, Hughey and Turner School, public and parish graded schools. The three banks have a combined capital of \$150,000. The government is vested in a mayor and a board of aldermen consisting of eight members. The majority of the inhabitants are American born; about 7 per cent are of Mexican and French descent and 3 per cent are colored. Pop. (1900) 5,074.

AARON SMITH,
Editor, 'Democrat.'

Weatherly, weth'er-ll, Frederic Edward, English song writer and barrister: b. Portsea, Somerset, 4 Oct. 1848. He was graduated from Oxford in 1871 and was called to the bar of the Inner Temple in 1887. He is widely known as the writer of popular songs, many of which have been given musical settings. Among them are 'Nancy Lee'; 'Polly'; 'Three Old Maids of Lee'; 'Darby and Joan.' Of his published volumes mention may be made of 'Muriel and Other Poems' (1870); 'Wilton School' (1872); 'Oxford Days' (1879); 'Rudiments of Logic' (1879); 'Questions in Logic, Progressive and General' (1883); 'Two Children' (1884); 'Lays for Little Ones' (1898).

Weaver, wé'vër, Aaron Ward, American naval officer: b. District of Columbia, 1 July 1832. He was graduated at the United States Naval Academy in 1854; became lieutenant in 1855 and in 1858-9 cruised along the African coast in the sloop Marion, and returned in command of the prize slave Ardemes. He served in the Union army with distinction through the Civil War, made commander in 1866; captain in 1876; and rear-admiral in 1893; and was retired in September of the year last named.

Weaver, James Baird, American political leader: b. Dayton, Ohio, 12 June 1833; d. Des Moines, Iowa, 6 Feb. 1912. He was graduated from Ohio University Law School 1854; and began practice in Iowa. In 1861 he entered the Union army, was promoted colonel in 1862, and brevetted brigadier-general in 1865. In 1866-70 he was district attorney 2d judicial district of Iowa; and in 1867-73 assessor of internal revenue 1st Iowa district. For some time he was editor of the *Iowa Tribune*, published at

Des Moines. He took an active part in the organization of the Greenback party, and was elected to Congress on its ticket in 1879, serving one term; in 1880 he was the Greenback candidate for President, receiving over 300,000 popular votes. Later he was affiliated with the People's Party, was a delegate to the National Convention in 1892, and was again nominated for the presidency, receiving over 1,000,000 popular votes. Since 1895 he has lived in Coffey, Iowa; and was elected mayor of that city in 1902. He wrote 'A Call to Action' (1892).

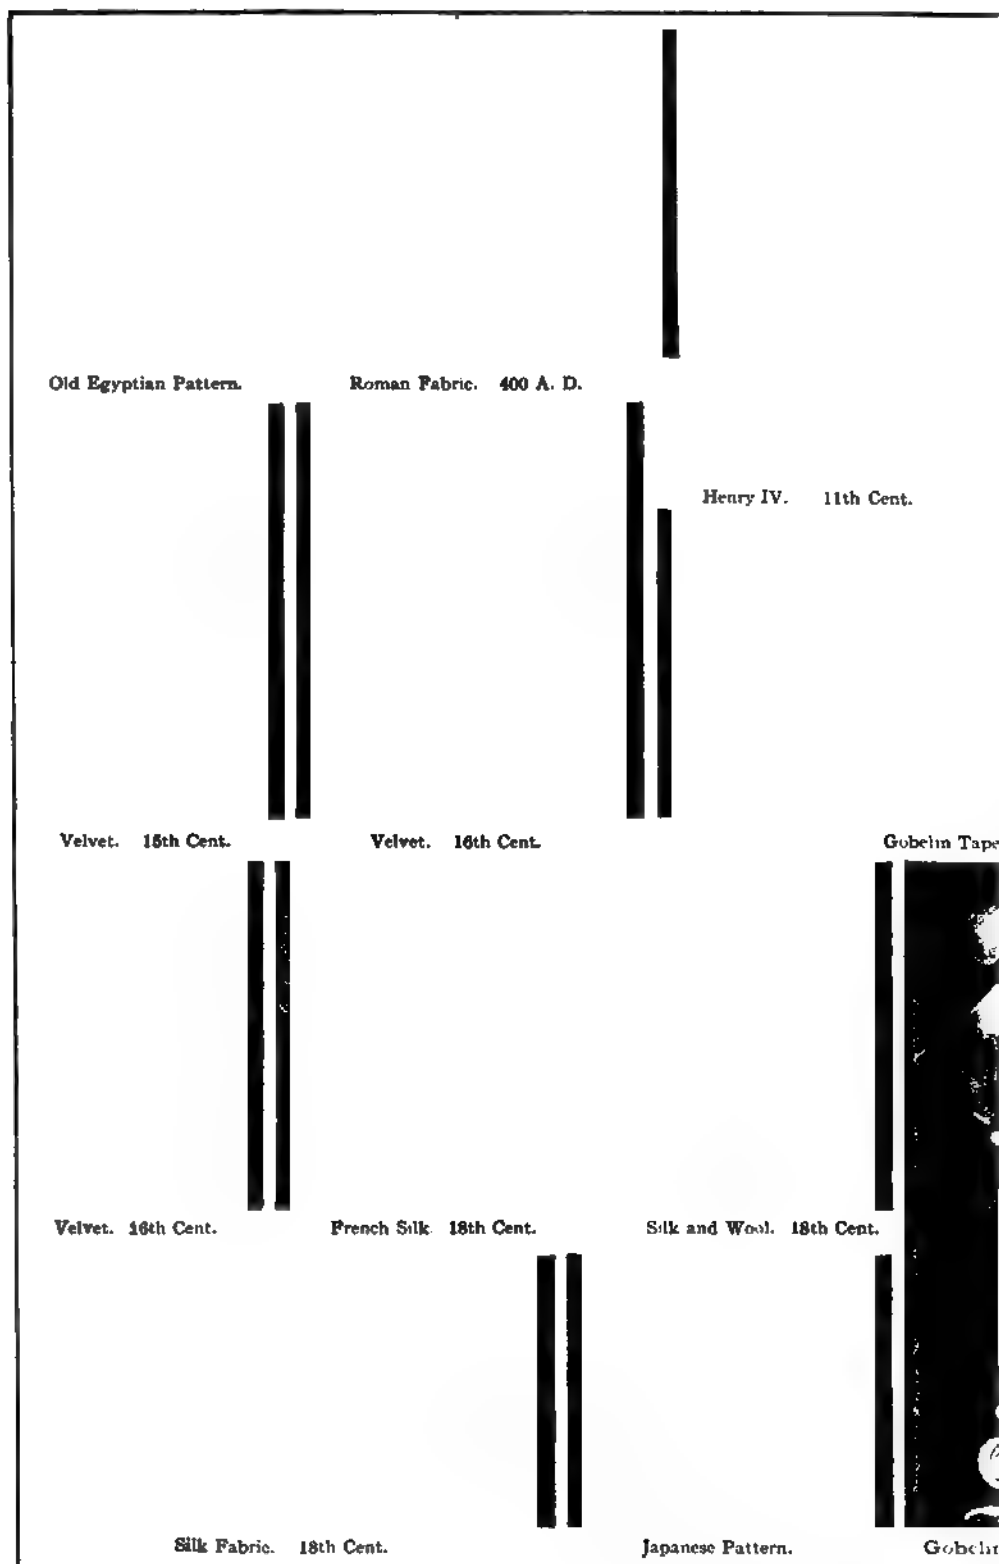

Weaver-bird, a bird of the family *Ploceidae* remarkable for their nests. The family is a large one and is confined to the warmer parts of the Old World, Africa being particularly rich in species. Weaver-birds closely resemble large finches, with somewhat elongated bodies, moderate wings, which have the outer primary quill better developed than in the *Fringillidae*, long tails, and very bright plumage, the latter often varied in the breeding season. Yellow and yellowish red are the prevailing tints, but species occur in which black, red, white, or gray predominates. The weaver-birds are extremely social, and many of the species live in large colonies during the period of incubation.

The nests of the various species differ considerably in shape and general structure, some (as the genus *Oriolus*), building a separate nest for the male, while the female sits in another on her eggs, till relieved by her mate; others again contain more than one chamber, as that of the golden weaver-bird (*Ploceus galbula*); while the social weaver-birds (*Phalacrocorax socius*) construct an umbrella-like roof, under which from 800 to 1,000 separate nests have been found. But in all cases fibres, slender twigs, or blades of grass are the materials employed, the whole being tightly woven, after having been rendered more flexible and adhesive by the application of saliva. In some cases the birds of a pair take positions on opposite sides of the structure and the fibres are passed through and through from one to the other. The nests themselves consist of a more or less globular portion, elongated into a tube below, with the entrance at the bottom or at the side. They are very generally suspended at the extremities of branches, and often over water, probably as affording security against monkeys, snakes, and other enemies. The Mahali weaver (*P. taha*) is said to insert thorns into its nest, as a further protection against marauders. A Philippine species (*Ploceus Philippinus*) builds flask-shaped nests of fine roots suspended mouth downward by long ropes of similar construction from the boughs of trees. Consult Bartlett, 'Monograph of the Weaver-birds' (Maidstone 1888).

Weaving, the art of interlacing yarn threads or other filaments by means of a loom, so as to form a web of cloth or other woven fabric. In this process two sets of threads are employed, which traverse the web at right angles to each other. The first set extends from end to end of the web in parallel lines, and is commonly called the warp; while the other set of threads crosses and interlaces with the warp from side to side of the web, and is generally called the weft or woof. In all forms of weaving the warp threads are first set up in the loom, and then the weft threads are worked into the warp, to and fro, by means of a shuttle. It

was by this fundamental process of interlacing two sets of thread in looms of simple mechanism that the mummy cloths of Egypt, the fine damasks and tapestries of the Greeks and Romans, the Indian muslins, the shawls of Cashmere, and the famed textile fabrics of Italy and the Netherlands were produced.

Hand Looms.—Until comparatively modern times all weaving was effected by means of the hand loom. This loom, in its latest form, consists of a frame of four upright posts braced together by cross-beams, the centre beam at the back being the warp beam, the beam in front being that upon which the web is wound, while just below this, in front, is the breast-beam for the support of the weaver at his work. At the top of the loom is an apparatus by which the heddles are lifted or lowered by means of treadles under the foot of the weaver. These heddles consist of two frames, from which depend cords attached by a loop or eye to each thread in the warp. As these threads are attached to the frames, alternately, it follows that when one heddle is raised every second thread in the warp is also raised, while the remaining threads are depressed; and this is called shedding the warp. When the warp threads are thus parted there is left a small opening or shed between the threads, and it is through this opening that the weaver drives his shuttle from side to side. The shuttle, which is hollow in the middle, contains the weft-thread wound round a bobbin or pirn, and as the shuttle is shot across the web this weft-thread unwinds itself. When the thread is thus introduced it is necessary to bring it to its place in the fabric. This is accomplished by means of the lay or batten, which is suspended from the top of the loom, and works to and fro like a pendulum by an attachment of vertical rods at each side called the swords. Attached to the lay is what is called the reed, which is a sort of comb having a tooth raised between every two threads of the warp, and so by driving up the lay after a weft-thread has been introduced the weaver strikes home that thread to its place in the cloth.

The Fly Shuttle.—A great improvement was made upon the hand loom when John Kay about 1740 invented the fly-shuttle, as it was called. This enabled the weaver to drive the shuttle both ways with the right hand by means of a cord attached to a box or trough placed at each end of the shuttle-race, which impelled the shuttle to and fro at each jerk of the cord. But the most important improvement was made on the hand-loom by Joseph Jacquard of Lyons, who, in 1801, invented an apparatus by which the most intricate patterns could be woven as readily as plain cloth. This is accomplished by an ingenious arrangement of hooks and wires, by means of which the warp threads are lifted in any order and to any extent necessary to make the shedding required by the pattern. The order in which these hooks and wires are successively lifted and lowered is determined by means of a series of pasteboard cards punctured with holes, the holes corresponding to a certain pattern and the cards passing successively over a cylinder or drum. The hooked wires pass through these holes and lift the warp-threads in an order which secures that the arranged pattern is woven into the fabric. When the pattern is extensive the machine may be provided with as many as 1,000 hooks and wires.

Power Looms.—Another development was made in the art of weaving by the invention of the power loom by the Rev. E. Cartwright in 1784. In the power loom, which has been gradually improved and adapted to steam and electric power, the principal motions of the old method of weaving, such as shedding the warp threads, throwing the shuttle, and beating up the thread, are still retained. The frame of the power loom is of cast iron, and motion is communicated to the loom by means of a shaft, the stroke of the lay being made by cranks attached to the driving shaft, while the shuttle is thrown by means of a lever attachment at the centre of the loom. Although the principle of the loom is the same in all kinds of weaving, yet there are numberless modifications for the production of special fabrics. The lappet loom is one suitable for weaving either plain or gauze cloths, and also for putting in representations of flowers, birds, or the like.

Cross Weaving is a term applied to that process in which, as in gauze weaving, the warp-threads, instead of lying constantly parallel, cross over or twist around one another, thus forming a plexus or interlacing independent of that produced by the weft.

Double Weaving consists in weaving two webs simultaneously one above the other, and interweaving the two at intervals so as to form a double cloth. Kidderminster or Scotch carpeting is the chief example of this process.

Pile Weaving is the process by which fabrics like that of velvets, velveteens, corduroy, and Turkey carpets are produced. In the weaving of these fabrics, besides the ordinary warp and weft, there is what is called the pile-warp, the threads of which are left standing in loops above the general surface till cut, and the cutting of which constitutes the pile.

Webb, Alexander Stewart, American soldier and educator: b. New York 15 Feb. 1835. He was graduated from West Point in 1855, was assistant professor of mathematics there in 1857-61, and at the outbreak of the Civil War became major of the 1st Rhode Island Infantry. He participated in the defense of Fort Pickens, was at the first battle of Bull Run, served in the Peninsular campaign and in 1863 became brigadier-general of volunteers. At Gettysburg he assisted in repulsing Pickett's charge and received a Congressional medal of honor in recognition of his gallantry. He was engaged in the Rapidan and the Wilderness campaigns, was wounded at Spottsylvania, and upon his return to duty was appointed chief-of-staff to General Meade. He received brevet rank as major-general of volunteers in 1864, and was brevetted brigadier-general of regulars in 1865. In 1866 he was promoted lieutenant-colonel, was brevetted major-general in the regular army in 1869, and in 1870 at his own request received an honorable discharge. He was president of the College of the City of New York in 1869-1903, and wrote: 'The Peninsula. McClennan's Campaign of 1862' (1882). Died 12 Feb. 1911.

Webb, Aston, English architect: b. London 22 May 1849. He was educated in private schools, was articled to Messrs. Banks and Barry, architects, and began practice in 1873. He was the architect for the completion of the Victoria and Albert Museum and the Royal College of Science, South Kensington; the Britan-

nia Naval College, Dartmouth, and the architectural accessories for the Victoria Memorial before Buckingham Palace. He has designed many churches, commercial structures, and mansions, and, with E. I. Bell, the Victoria Courts, Birmingham; the Birmingham University and the new schools of Christ's Hospital. He was president of the Architectural Association in 1884, and vice-president of the Royal Institute of British Architects 1893-7.

Webb, Charles Henry (pen name "JOHN PAUL"), American journalist and humorist: b. Rouse's Point, N. Y., 24 Jan. 1834; d. N. Y. City 24 May 1905. He was on the staff of the *New York Times* (1860-3), and going to California in 1863 founded the 'Californian,' San Francisco, which he edited till 1866. Subsequently he contributed to the *New York Tribune* humorous articles signed 'Jean Paul.' He invented an adding machine, but was better known by his burlesque dramas, among which are 'Lif-fith Lank' (1867), and 'Saint Twel' Mo' (1868). Other works by him are: 'John Paul's Book' (1874); 'Parodies, Prose, and Verse' (1876); 'Vagrom Verse' (1889); 'More Vagrom Verse' (1901).

Webb, James Watson, American journalist and author: b. Claverack, N. Y., 8 Feb. 1802; d. New York 7 June 1884. He entered the United States army as 2d lieutenant, and became adjutant in 1825; served in the West under General Scott; and resigned from the army in 1827. In that year he became editor of the *Morning Courier* in New York; this was united with the *Enquirer* as the *Courier and Enquirer*, which he edited until 1861, when it was merged in the *New York World*. At first he supported Jackson but later as vigorously opposed Jackson's measures, and made the *Courier and Enquirer* one of the leading Whig papers. In 1851 he was appointed engineer-in-chief of New York State, and given the rank of major-general. After refusing an appointment as minister to Turkey, he was appointed minister to Brazil in 1861, which office he held until 1869. In 1865, when he was in France for a time, he negotiated a secret treaty with the emperor providing for the removal of the French troops from Mexico. He wrote 'Altowan, or Incidents of Life and Adventure in the Rocky Mountains' (1846); 'Slavery and its Tendencies' (1856); and 'National Currency' (1875).

Webb, Samuel Blatchley, American soldier: b. Wethersfield, Conn., 15 Dec. 1753; d. Claverack, N. Y., 3 Dec. 1807. He joined the Revolutionary army immediately after the battle of Lexington, was engaged at Bunker Hill, became aide to General Putnam, and in June 1776 was appointed private secretary and aide-de-camp to Washington, receiving rank as lieutenant-colonel. He was engaged at the battles of Long Island, White Plains, Trenton, and Princeton, and in 1777 took command of the 3d Connecticut regiment which he had organized, equipping it almost entirely from his own funds. He accompanied General Parson's expedition to Long Island in 1777, and on 10 December was captured with his command. He remained a prisoner until 1780, when he was appointed to succeed Baron Steuben in command of the light infantry, with brevet rank of brigadier-general. He was one of the 16 founders of the Society of the Cincinnati in 1783, and in 1789 held the

Bible on which Washington took the oath as first President of the United States.

Webb, Sidney, English political economist and Fabian socialist: b. London 13 July 1859. He was educated in Switzerland and at the City of London College, and in 1878 entered the civil service, holding several different positions chiefly in the colonial office, and resigning from the service in 1891. He was admitted to the bar in 1885. He was one of the founders of the Fabian Society (q.v.), and in 1891 was elected to the London County Council as a candidate endorsed by the Fabian Socialists. He is lecturer on political economy at the London School of Economics and Political Science, and is a member of the Economic Faculty of London University. He has written 'Socialism in England' (1890); 'The Eight Hours' Day' (1891, with Harold Cox); 'The London Programme' (1892); 'Labor in the Longest Reign' (1897); and in collaboration with his wife, Beatrice Potter Webb, 'The History of Trade Unionism' (1894); 'Industrial Democracy' (1897), and 'Problems of Modern Industry' (1898). 'The History of Trade Unionism' is an exhaustive account of the origin and progress of the English labor unions; 'Industrial Democracy' shows the organization and ideals of the modern British trades unions. These two works form the most valuable contribution to the history of English labor; and written with sympathy and forcible directness, well express the power and vitality of the labor movement.

Webb City, Mo., city in Jasper County; on the Missouri R., the Saint Louis & S. F., and the Kansas City, F. S. & M. R.R.'s; about 10 miles south by west of Carthage, and known with its neighbor, Cartersville, as one of the "Twin Cities." It was first incorporated in 1876, three years after the discovery of extensive deposits of lead ore, zinc being discovered several years later; and in 1890 became a city, its government being administered by a mayor and a council of 10 members. It is important as a mining town, the Webb City-Cartersville mining district having in 1894-1904 produced lead and zinc to the value of \$23,000,000. It boasts the distinction of having no miners' unions. Its deposits of ore are near the surface and are believed to be almost inexhaustible. It is the centre of a rich agricultural and fruit-growing section. The Webb City Iron Works are second largest in southwestern Missouri, and the city has also lumber and flour mills. It has 12 churches, 5 graded elementary schools, a high school (cost of building \$30,000), and is the seat of the Great Western Normal School and Business College. The waterworks system cost originally \$100,000. It has two banks (combined capital \$700,000); and two daily newspapers. Pop. (1910) 11,817.

Webber, web'b'er, Charles Wilkins, American author: b. Russellville, Ky., 29 May 1819; d. Nicaragua 11 April 1856. In early youth he passed several years of adventurous life on the Texan frontier, and later settled in New York where he was for a short time assistant editor of the 'American Review,' and a prolific contributor to, that and the 'Democratic Review' and other periodicals, in which appeared in a serial form his 'Old Hicks the Guide,' and other tales of backwoods life and adventure. In 1849

he published the 'Gold Mines of the Gila.' His remaining works comprise the 'Hunter Naturalist' (1851); 'Spiritual Vampirism' (1853); 'Tales of the Southern Border' (1853); and 'Wild Scenes and Song Birds' (1854), forming a second volume of the 'Hunter Naturalist.' In 1856 he joined an expedition to Nicaragua in aid of William Walker (q.v.), and was killed in a skirmish.

Webber, Samuel, American college president: b. Byfield, Mass., 1759; d. Cambridge, Mass., 17 July 1810. He was graduated at Harvard in 1784, subsequently entered the ministry, and in 1787 was appointed university tutor of mathematics. In 1789 he was appointed to the chair of mathematics and natural philosophy, which he retained until the death of President Joseph Willard in 1804, when he became his successor. He died while holding this office. He was one of the commissioners appointed to determine the boundary between the United States and the British provinces, and published 'A System of Mathematics' (1801).

Weber, wēb'ér, Adna Ferrin, American statistician: b. Springville, Erie County, N. Y., 14 July 1870. He was graduated from Cornell in 1894, studied social science in Europe, was deputy commissioner of labor statistics of New York 1899-1901, and has been chief statistician of New York State Labor since 1901. He has published 'The Growth of Cities in the 19th Century' (1899); and statistical reports on labor.

Weber, wā'b'ér, Ernst Heinrich, German physiologist: b. Wittenberg, Germany, 24 June 1795; d. Leipsic, Germany, 26 Jan. 1878. He was educated at Leipsic, was appointed professor of comparative anatomy there in 1818, and of physiology in 1840. He originated the formula known as Weber's Law (q.v.) and wrote: 'Anatomia Comparativa Nervi Sympathici' (1817); 'Lehre vom Bau und von der Verrichtung der Geschlechtsorgane' (1846); 'Annotationes Anatomice et Physiologicae' (1851); etc.

Weber, Georg, German historian: b. Bergzabern, Rhenish Bavaria, 10 Feb. 1808; d. Heidelberg 10 Aug. 1888. He was educated at Erlangen, traveled extensively, and was director of the normal school at Heidelberg in 1848-72. His writings, which include: 'Lehrbuch der Weltgeschichte' (1847); 'Geschichte der deutschen Litteratur' (1847); 'Allgemeine Weltgeschichte für die gebildeten Stände' (15 vols. 1857-80); etc.

Weber, Karl Maria (Friedrich Ernst), BARON VON, German composer: b. Eutin, Grand Duchy of Oldenburg, 18 Dec. 1786; d. London 5 June 1826. He was a pupil of J. P. Heuschkel of Hildburghausen, attaining great skill as a pianoforte virtuoso and much proficiency in the technique of composition; and continued his studies with Michael Haydn at Salzburg, and at Munich with Kalcher (harmony and composition) and Valesi (singing). His opera, 'Das Waldmädchen,' was produced with but moderate success at Freiberg, though more fortunate at Chemnitz and (in 1805) at Vienna. A second opera, 'Peter Schmoll und seine Nachbarn,' first presented at Augsburg (1803) met with no particular approval. Early in 1803 he went to Vienna, and there that curious genius, the Abbé Vogler, was for a year his instructor. By Vog-

ler's aid, he secured the post of kapellmeister of the opera at Breslau (1804). He displayed great ability as an organizer and director, but resigned in 1806, and became musical director to Prince Eugene of Würtemberg at Karlsruhe, Silesia. In 1807 he entered the service of Duke Louis of Würtemberg at Stuttgart as private secretary, and in 1808-10 was working on his first larger opera, 'Silvana,' the libretto of which was to a large extent based on that of his earlier 'Waldmädchen.' He was falsely charged with fraud, and despite all lack of evidence against him, was perpetually banished from Würtemberg 26 Feb. 1810. Then he went to Mannheim, where his first symphony was most favorably received, and his piano-playing was also very successful; and thence to Darmstadt, where he once more became a pupil of Vogler. His comic operetta, 'Abu Hassan,' was completed in 1810 and given at Munich, and 'Silvana,' with additions, gained adequate recognition at Berlin in 1812. It was not, however, until 1813 that Weber held an important appointment; in that year he was made kapellmeister of the Prague opera, and there proved himself the first of the great German musicians to be conspicuous also as a conductor. His administration of marked success was brought to a close by his giving it up in 1816. His chief compositions of this period were settings of Körner's songs, and the cantata 'Kampf und Sieg,' founded on the battle of Waterloo. In 1816 he went to Dresden, where previously Italian opera had held undisputed sway, to organize the new venture of German opera; and soon he had attained, except among a few partisans, an unqualified victory. The appointment was confirmed for life, and he was frequently summoned to direct the music of the chapel royal. He became widely known with the presentation of his opera, 'Der Freischütz,' at Berlin 18 June 1821, which was quickly echoed elsewhere, being simultaneously given in London in three different places. Few operatic works, it is said, have equaled it in immediate triumph. 'Euryanthe' did not meet similar approval at Vienna (1823), though appreciation was duly encountered in Dresden, Leipsic, and Berlin. On the commission of Charles Kemble of Covent Garden, London, he wrote 'Oberon' to an English libretto by J. R. Planché, himself learning English to be able to work to better effect. He conducted the first 12 performances, and after a reception which almost surpassed that of the 'Freischütz,' played at numerous concerts. With the 'Freischütz,' which struck a distinctively national note, Weber became the founder of what is known as the romantic school of German opera. He has been claimed as a predecessor of Wagner in adapting his music to the dramatic requirements, and the use of leading motives. In his operatic works he apparently preferred legendary and supernatural elements, which he could make musically effective. Though his operas are the best known of his writings, he did musicianly and even brilliant work in the direction of Lieder and pianoforte compositions. Consult: Jähns, 'C. M. von Weber: Eine Lebensskizze' (1873); the biographies by Rau (1865); Benedict (1881); Reissmann (1882); and Gehrman (1899); also Benedict, 'Musiciens du Temps Passé' (1893), and the article by Spitta in Grove's 'Dictionary,' Vol. IV. (1889).

Weber, Max Maria von, German civil engineer, son of Karl Maria von Weber (q.v.): b. Dresden, Saxony, 25 April 1822; d. Berlin, Germany, 18 April 1881. He studied engineering in Dresden and in England, and in 1850 entered the civil service of Saxony. He went to Vienna in 1870, where he was engaged in the extension of the Austrian railway system and in 1878 to Berlin on a like service. He wrote extensively, not only on technical themes, but in the field of general literature. His writings include: 'Schule des Eisenbahnwesens' (1857); 'Karl Maria von Weber: ein Lebensbild' (1864-6); 'Nationalität und Eisenbahnpolitik' (1876); etc., besides the posthumously published 'Vom rollenden Flügelrad' (1882), to which is added a biography by M. Jähns.

Weber, Wilhelm Eduard, German physicist, brother of E. H. Weber (q.v.): b. Wittenberg 24 Oct. 1804; d. Göttingen 23 June 1891. He was educated at Halle, was professor of physics at Göttingen in 1831-7, and occupied that chair at Leipzig in 1843-9, after which he resumed his chair at Göttingen. He was associated with his brothers and with Gauss in various publications concerning physics, and made valuable researches in the fields of electricity and magnetism. He also published a series of essays, 'Elektrodynamische Massbestimmungen' (1846-67). Consult Heinrich Weber, 'Wilhelm Weber' (1893).

Weber, wé'bér, a river of Utah, whose headwaters are on the west slope of the Uinta Mountains. It flows northwest through fertile lands and through a series of cañons; and after a course of nearly 200 miles it enters Great Salt Lake. The famous Weber Cañon is the gorge made by this river where it breaks through the Wasatch Mountains. The Union Pacific Railroad passes through this gorge. The descent in places is most rapid, and the consequent water-power is extensive. At Ogden, the mean volume of water is about 2,000 cubic feet a second. The Weber is much used for irrigation. The river has built up at Ogden a large delta which extends into ancient Lake Bonneville (q.v.).

Weber's Law, so called from E. H. Weber (q.v.), who, after a long series of experiments on the sensations of sight, hearing and touch, formulated the law which has since gone by his name. The principle of the law is that, in order that the sensational difference may remain unchanged, the increase of stimulus must maintain the same proportion to the intensity of the preceding stimulus, or, in order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression.

Web'ster, Daniel, American orator and statesman: b. Salisbury, N. H., 18 Jan. 1782; d. Marshfield, Mass., 24 Oct. 1852. Of the generation of American statesmen that followed those of the Revolutionary period, few will live as long in the memory of the people, and none as long in the literature of the country, as Daniel Webster. His figure rises above the level of his time like a monument of colossal proportions. His father, a Puritan of stern and sterling character, had, as a backwoods farmer in New Hampshire, been an Indian fighter while New England had an Indian frontier, a soldier in the French war, and a captain in the Revo-

lutionary army. His high standing among his neighbors made him a judge of the local court. Ambitious for his children, he strained his scanty means to the utmost to give his son the best education within reach, first at Exeter Academy, then at Dartmouth College. From his earliest days Daniel was petted by good fortune. His seemingly delicate health, his genial nature, and his promising looks, put, in the family circle, everybody at his service, even at personal sacrifice, and such sacrifice by others he became gradually accustomed to expect, as a prince expects homage.

At the academy and the college he shone not by phenomenal precocity, but by rapid progress in the studies he liked,—Latin, literature, and history. He did not excel in the qualities of the genuine scholar,—patient and thorough research, and the eager pursuit of knowledge for its own sake; but he was a voracious reader, assimilating easily what he read by dint of a strong memory and of serious reflection, and soon developed the faculty of making the most of what he knew by clear, vigorous, affluent, and impressive utterance. At an early age, too, he commanded attention by a singular charm of presence, to which his great dark eyes contributed not a little; and notwithstanding his high animal spirits, by a striking dignity of carriage and demeanor,—traits which gradually matured into that singularly imposing personality, the effect of which is described by his contemporaries in language almost extravagant, borrowing its similes from kings, cathedrals, and mountain peaks.

His conspicuous power of speech caused him, even during his college days, to be drawn upon for orations on the Fourth of July and other festive days. The same faculty, reinforced by his virtue of knowing what he knew, gave him, after he had gone through the usual course of law study, early successes at the bar, which soon carried him from the field of legal practice into political life. He inherited Federalism from his father, and naturally accepted it, because he was a conservative by instinct and temperament. Existing things had a *prima facie* claim upon his respect and support, because they existed. He followed his party with fidelity, sometimes at the expense of his reason and logic, but without the narrow-mindedness of a proscriptive partisan spirit. In the excited discussions which preceded and accompanied the War of 1812, he took an active part as a public speaker and a pamphleteer. Something happened then, at the very beginning of his public career, that revealed in strong light the elements of strength as well as those of weakness in his nature. In a speech on the Fourth of July, 1812, at Portsmouth, N. H., he set forth in vigorous language his opposition to the war policy of the administration; but with equal emphasis he also declared that the remedy lay, not in lawless resistance, but only in "the exercise of the constitutional right of suffrage,"—a proposition then by no means popular with the extreme Federalists of New England. A few weeks later he was appointed by a local mass convention of Federalists to write an address on the same subject, which became widely known as the 'Rockingham Memorial.' In it he set forth with signal force the complaints of his party; but as to the remedy, he consented to give voice to the sense

DANIEL WEBSTER.

WEBSTER

of the meeting by a thinly veiled threat of secession, and a hint at the possibility of a dissolution of the Union. In the first case he expressed his own opinions as a statesman and a patriot; in the second he accepted the opinions of those around him as his own, and spoke with equal ability and vigor as the mouthpiece or attorney of others: a double character, destined to reappear from time to time in his public life with puzzling effect.

New Hampshire sent him to Congress, where he took his seat in the House of Representatives in May 1813. He soon won a place in the front rank of debaters, especially on questions of finance. But the two terms during which he represented a New Hampshire constituency were a mere prelude to his great political career. In 1817 he left Congress to give himself to his legal practice, which gained much in distinction and lucrativeness by his removal to Boston. He rose rapidly to national eminence as a practitioner in the Federal as well as the State tribunals. It was there that he won peculiar lustre through his memorable argument in the famous Dartmouth College case before the Federal Supreme Court, which fascinated John Marshall on the bench, and moved to tears the thronged audience in the court-room. It left Webster with no superior and with few rivals at the American bar. It may be questioned whether he was a great lawyer in the highest sense. There were others whose knowledge was larger and more thorough, and whose legal opinion carried greater authority. But hardly any of these surpassed him in the faculty of seizing, with instinctive sureness of grasp, the vital point of a cause, of endowing mere statement with the power of demonstration, of marshaling facts and arguments in massive array for concentric attack on the decisive point, of moving the feelings together with the understanding by appeals of singular magic, and also of so assimilating and using the work of others as if it had been his own. Adding to all this the charm of that imposing personality, which made every word falling from his lips sound as if it were entitled to far more than ordinary respect, he could not fail to win brilliant successes. He was engaged in many of the most important and celebrated cases of his time—some then celebrated and still remembered because of the part he played in them.

In Boston, Webster found a thoroughly congenial home. Its history and traditions, its wealth and commercial activity, the high character of its citizenship, the academic atmosphere created by its institutions of learning, the refined tone of its social circles, the fame of its public men, made the Boston of that period, in the main attributes of civilized life, the foremost city in the United States. Boston society received Webster with open arms, and presently he became in an almost unexampled measure its idol. Together with the most distinguished personages of the State, he was elected a member of the convention called to revise the State Constitution, where as the champion of conservative principles he advocated and carried the proposition that the State Senate should remain the representative of property. When in 1820, the day arrived for the celebration of the two-hundredth anniversary of the landing of the Pilgrims on Plymouth Rock, it was he whom the public voice designated as the orator

of the day. The oration, with its historical picturesqueness, its richness of thought and reasoning, its broad sweep of contemplation, and the noble and magnificent simplicity of its eloquence, was in itself an event. No literary production of the period in America achieved greater renown. From that time on, Massachusetts loved to exhibit herself in his person on occasions of state; and in preference to all others, Webster was her spokesman when she commemorated the great events of her history. As such he produced a series of addresses—at the laying of the corner-stone, and later at the completion, of the Bunker Hill monument, on the death of John Adams and of Thomas Jefferson, and on other occasions—which his contemporaries acclaimed as ranking with the great oratorical achievements of antiquity.

Webster soon appeared in Congress again: first in 1823, in the House of Representatives, as the member from the Boston district; and a few years later in the Senate. Then began the most brilliant part of his political career. It was the period when the component elements of the old political parties—the Federalists and the Republicans—became intermingled; when old party issues vanished; and when new questions, or rather old questions in new shapes and relations, caused new groupings of men to be formed. In the confusion of the political and personal conflicts which characterized the so-called "era of good feeling," and which immediately followed it, Webster became a supporter of the administration of John Quincy Adams; and, as an old Federalist and conservative, was naturally attracted by that combination of political forces which subsequently organized itself as the Whig party.

In the House of Representatives he attracted the attention of the world abroad by a stinging philippic against the "Holy Alliance" in a eulogy on the Greek revolution, and by a sober exposition of the Monroe Doctrine in a speech on the famous Panama mission. But his most remarkable achievement was an argument against Henry Clay's "American System"—tariff protection as a policy, the very policy which was destined to become the corner-stone of the Whig platform. Webster's Free Trade speech—for so it may be called—summed up and amplified the views he had already expressed on previous occasions, in a presentation of fundamental principles so broad and clear, with a display of knowledge so rich and accurate, and an analysis of facts and theories so keen and thorough, that it stands unsurpassed in our political literature, and may still serve as a text-book to students of economic science. But Clay's tariff was adopted nevertheless; and four years later Webster abandoned many of his own conclusions, on the ground that in the meantime New England, accepting protection as the established policy of the country, had invested much capital in manufacturing enterprises, the success of which depended upon the maintenance of the protective policy, and should therefore not be left in the lurch. For this reason he became a protectionist. This plea appeared again and again in his high-tariff speeches which followed; but he never attempted to deny or shake the broad principles so strongly set forth in his great argument of 1824.

Webster reached the highest point of his power and fame when, in 1830, he gave

as a member of the Senate, voice as no one else could to the national consciousness of the American people. Before the War of 1812, the Union had been looked upon by many thoughtful and patriotic Americans as an experiment,—a promising one indeed, but of uncertain issue. Whether it would be able to endure the strain of divergent local interests, feelings, and aspirations, and whether its component parts would continue in the desire permanently to remain together in one political structure, were still matters of doubt and speculation. The results of the War of 1812 did much to inspire the American heart with a glow of pride in the great common country, with confident anticipations of its high destinies, and with an instinctive feeling that the greatness of the country and the splendors of its destinies depended altogether upon the permanency of the Union. The original theory that the Constitution of the United States was a mere compact of partnership between independent and sovereign commonwealths, to be dissolved at will, whatever historical foundation it might have had, yielding to an overruling sentiment of a common nationality. This sentiment was affronted by the Nullification movement in South Carolina, which, under the guise of resistance to the high tariff of 1828, sought to erect a bulwark for slavery through the enforcement of the doctrine that a State by its sovereign action could overrule a Federal law, and might, as a last resort, legally withdraw from the "federal compact." Against this assumption Webster rose up in his might, and in his famous "Reply to Hayne" struck down the doctrine of the legality of State resistance and of secession with blows so crushing, and maintained the supremacy of the Federal authority in its sphere, and the indissolubility of the Union, with an eloquence so grand and triumphant, that as his words went over the land the national heart bounded with joy and broke out in enthusiastic acclamations. At that moment Webster stood before the world as the first of living Americans. Nor was this the mere sensation of a day. His "Liberty and Union, now and forever, one and inseparable!" remained the watchword of American patriotism, and still reverberated 30 years later in the thunders of the Civil War. That glorious speech continues to hold the first place among the monuments of American oratory. In the contest against the Nullification movement in South Carolina, Webster firmly maintained, against Henry Clay's compromise policy, that wherever the national authority was lawlessly set at defiance, peace should never be purchased by concession to the challengers; and that it was time to "test the strength of the government." He therefore sturdily supported President Jackson's "Force Bill," although the administration of that doughty warrior was otherwise most uncongenial to him. But when the compromise had actually been adopted, he dropped back into the party line behind Clay's leadership, which he henceforth never again forsook. There was an element of indolence in his nature which it needed strong impulses to overcome, so as to set the vast machinery of his mind in full motion. Such an impulse was furnished again by Jackson's attack on the United States Bank, and by other somewhat autocratic financial measures. Webster opposed this policy in a series of

speeches on currency and banking, which deserve very high rank in the literature of that branch of economics. They were not free from partisan bias in the specific application of those fundamental principles of which Webster had such a masterly grasp; but notwithstanding this, his deep insight into the nature and conditions of credit, and his thorough study and profound judgment of the functions of banking, made him an invaluable teacher of the science of public finance. Nobody has ever depicted the vices and dangers inherent in an unsound currency, and the necessity of grounding the monetary system upon a firm basis of value, with greater force and more convincing lucidity.

But in spite of the brilliancy and strength of his efforts in opposing Jackson's wilful and erratic policies, Webster never became the real leader of the Whig party. Although greatly the superior of Clay in wealth of knowledge, in depth of thought, in statesmanlike breadth of view, in solidity of reasoning power, and in argumentative eloquence, he fell far behind him in those attributes which in contests for general leadership are apt to turn the scale. The spirit of initiative, force of will, that sincere self-confidence which extorts confidence from others, bold self-assertion in doubtful situations, and constant alertness in watching and directing the details of political movements. Clay therefore remained the general leader of the Whig party; while Webster, with New England at his back, stood now by his side, now behind him, as in feudal times a great duke, rich in treasure and lands and retainers, himself of royal blood, may have stood now behind, now by the side of his king. Unhappily for himself, Webster was not satisfied with the theatre of action on which his abilities fitted him for the greatest service, and on which he achieved his highest renown. At a comparatively early period of his career he ardently wished to be sent as minister to England, and he bore a grudge to John Quincy Adams for his failure to gratify that desire. Ever since his "Reply to Hayne" had made his name a household word in the country, an ungovernable longing possessed him to be President of the United States. The morbid craving commonly called "the Presidential fever" developed in him, as it became chronic, its most distressing form, disordering his ambition, unsettling his judgment, and warping his statesmanship. His imagination always saw the coveted prize within his grasp, which in reality it never was. He lacked the sort of popularity which since the administration of John Quincy Adams seemed to be required for a Presidential candidacy. People listened to him with rapture and wonder, but as to the Presidency, the fancy and favor of the politicians, as well as of the masses, obstinately ran to other men. So it was again and again. Clay, too, was unfortunate as a Presidential candidate; but he could obtain at least the nomination of his party so long as there appeared to be any hope for his election. Webster was denied even that. The vote for him in the party conventions was always distressingly small—usually confined to New England, or only a part of it. Yet he never ceased to hope against hope, and thus to invite more and more galling disappointments. To Henry Clay he could yield without humiliation; but when he saw his party prefer to himself not

once, but twice and three times, men of only military fame, without any political significance whatever, his mortification was so keen that in the bitterness of his soul he twice openly protested against the result.

The cause of this steady succession of failures may have been, partly, that the people found him too unlike themselves, too unfamiliar to the popular heart; and partly that the party managers shrunk from nominating him because they saw in him not only a giant, but a very vulnerable giant, who would not "wear well" as a candidate. They had indeed reason to fear the discussions to which in an excited canvass his private character would be subjected. Of his moral failings, those relating to money were the most notorious and the most offensive to the moral sense of the plain people. In the course of his public life he became accustomed not only to the adulation but also to the material generosity of his followers. Great as his professional income was, his prodigality went far beyond his means; and the recklessness with which he borrowed and forgot to return, betrayed an utter insensibility to pecuniary obligation. With the coolest nonchalance he spent the money of his friends, and left to them his debts for payment. This habit increased as he grew older, and severely tested the endurance of his admirers. So grave a departure from the principles of common honesty could not fail to cast a dark shadow upon his character, and it is not strange that the cloud of distrust should have spread from his private to his public morals. The charge was made that he stood in the Senate advocating high tariffs as the paid attorney of the manufacturers of New England. It was met by the answer that so great a man would not sell himself. This should have been enough. Nevertheless, his defenders were grievously embarrassed when the fact was pointed out that it was after all in great part the money of the rich manufacturers and bankers that stocked his farm, furnished his house, supplied his table, and paid his bills. A man less great could hardly have long sustained himself in public life under such a burden of suspicion. That Daniel Webster did sustain himself, strikingly proved the strength of his prestige. But his moral failings cost him the noblest fruit of great service,—an unbounded public confidence. Although disappointed in his own expectations, he vigorously supported General Harrison for the Presidency in the campaign of 1840, and in 1841 was made secretary of state. He remained in that office until he had concluded the famous Ashburton Treaty, under the administration of President Tyler, who turned against the Whig policies. After his resignation he was again elected to the Senate. Then a fateful crisis in his career approached.

The annexation of Texas, the Mexican war, and the acquisition of territory on our southern and western borders, brought the slavery question sharply into the foreground. Webster had always, when occasion called for a demonstration of sentiment, denounced slavery as a great moral and political evil, and although affirming that under the Constitution it could not be touched by the action of the general government in the States in which it existed, declared himself against its extension. He had opposed the annexation of Texas, the war against Mexico, and the enlargement of the republic by

conquest. But while he did not abandon his position concerning slavery, his tone in maintaining it grew gradually milder. The impression gained ground that as a standing candidate for the Presidency, he became more and more anxious to conciliate Southern opinion. Then the day came that tried men's souls. The slave power had favored war and conquest, hoping that the newly acquired territory would furnish more slave States and more Senators in its interest. That hope was dashed when California presented herself for admission into the Union, with a State constitution excluding slavery from her soil. To the slave power this was a stunning blow. It had fought for more slave States and conquered for more free States. The admission of California would hopelessly destroy the balance of power between freedom and slavery in the Senate. The country soon was ablaze with excitement. In the North the antislavery feeling ran high. The "fire-eaters" of the South, exasperated beyond measure by their disappointment, vociferously threatened to disrupt the Union. Henry Clay, true to his record, hoped to avert the danger by a compromise. He sought to reconcile the South to the inevitable admission of California by certain concessions to slavery, among them the ill-famed and ill-fated Fugitive Slave Law; a law offensive not only to antislavery sentiment, but also to the common impulses of humanity and to the pride of manhood.

Webster had to choose. The antislavery men of New England, and even many of his conservative friends, hoped and expected that he would again, as he had done in Nullification times, proudly plant the Union flag in the face of a disunion threat, with a defiant refusal of concession to a rebellious spirit, and give voice to the moral sense of the North. But Webster chose otherwise. On the 7th of March 1850, he spoke in the Senate. The whole country listened with bated breath. While denouncing secession and pleading for the Union in glowing periods, he spoke of slavery in regretful but almost apologetic accents, upbraided the abolitionists as mischievous marplots, earnestly advocated the compromise, and commended that feature of it which was most odious to Northern sentiment,—the Fugitive Slave Law. From this "Seventh of March Speech"—by that name it has passed into history—Webster never recovered. It stood in too striking a contrast to the "Reply to Hayne." There was indeed still the same lucid comprehensiveness of statement. The heavy battalions of argument marched with the same massive tread. But there was lacking that which had been the great inspiration of the "Reply to Hayne,"—the triumphant consciousness of being right. The effect of the speech corresponded to its character. Southern men welcomed it as a sign of Northern submissiveness, but it did not go far enough to satisfy them. The impression it made upon the antislavery people of the North was painful in the extreme. They saw in it "the fall of an archangel." Many of them denounced it as the treacherous bid of a Presidential candidate for Southern favor. Their reproaches varied from the indignant murmur to the shrillest note of execration. Even many of his staunchest adherents among the conservative Whigs stood at first stunned and perplexed, needing some time to gather themselves up for his defense. This was not surprising. Henry

Clay would plan and advocate the compromise of 1850 without loss of character. Although a man of antislavery instincts, he was himself a slaveholder representing a slaveholding community, a compromiser in his very being; and compromise had always been the vital feature of his statesmanship. But Webster could not apologize for slavery, and in its behalf approve compromise and concession in the face of disunion threats, without turning his back upon the most illustrious feat of his public life. Injustice may have been done to him by the assailants of his motives, but it can hardly be denied that the evidence of circumstances stood glaringly against him. He himself was ill at ease. The virulent epithets and sneers with which he thenceforth aspersed antislavery principles and antislavery men—contrasting strangely with the stately decorum he had always cultivated in his public utterances—betrayed the bitterness of a troubled soul.

The 7th of March speech, and the series of addresses with which he sought to set right and fortify the position he had taken, helped greatly in inducing both political parties to accept the compromise of 1850, and also in checking, at least for the time being, the antislavery movement in the Northern States. But they could not kill that movement, nor could they prevent the coming of the final crisis. They did, however, render him acceptable to the slave power, when, after the death of General Taylor, President Fillmore made him secretary of state. In 1852 his hope to attain the Whig nomination for the Presidency rose to the highest pitch, although his prospects were darker than ever. But he had reached the age of seventy; this was his last chance, and he clung to it with desperate eagerness. He firmly counted upon receiving in the convention a large number of Southern votes; he received not one. His defeat could hardly have been more overwhelming. The nomination fell to General Scott. In the agony of his disappointment, Webster advised his friends to vote for the Democratic candidate, Franklin Pierce. In 1848 he had declared General Taylor's nomination to be one "not fit to be made"; but after all he had supported it. Then he still saw a possibility for himself ahead. In 1852, the last hope having vanished, he punished his party for having refused him what he thought his due, by openly declaring for the opposition. The reasons he gave for this extreme step were neither tenable, nor even plausible. It was a wail of utter despair. His health had for some time been failing, and the shock which his defeat gave him aggravated his ailment. On the morning of 24 Oct. 1852 he died.

Over Webster's grave there was much heated dispute as to the place he would occupy in the history of his country. Many of those who had idolized him during his life extolled him still more after his death, as the demigod whose greatness put all his motives and acts above criticism, and whose genius excused all human frailties. Others, still feeling the smart of the disappointment which that fatal 7th of March had given them, would see in him nothing but rare gifts and great opportunities prostituted by vulgar appetites and a selfish ambition. The present generation, remote from the struggles and passions of those days, will be more impartial in its judgment. Looking back upon the

time in which he lived, it beholds his statuesque form towering with strange grandeur among his contemporaries,—huge in his strength, and huge also in his weaknesses and faults; not indeed an originator of policies or measures, but a marvelous expounder of principles, laws, and facts, who illumined every topic of public concern he touched, with the light of a sovereign intelligence and vast knowledge; who, by overpowering argument, riveted around the Union unbreakable bonds of constitutional doctrine; who awakened to new life and animated with invincible vigor the national spirit; who left to his countrymen and to the world invaluable lessons of statesmanship, right, and patriotism, in language of grand simplicity and prodigiously forceful clearness; and who might stand as its greatest man in the political history of America, had he been a master character as he was a master mind.

Consult: Curtis, 'Life of Daniel Webster' (1870); Wilkinson, 'Webster: an Ode' (1882); Lodge, 'Daniel Webster' in 'American Statesman Series' (1883); McMaster, 'Daniel Webster' (1902); and the histories of Schouler, Rhodes, and Von Holst. Webster's private correspondence was published in 1857, and his speeches, etc., in six volumes.

CARL SCHURZ,
Author of 'Life of Henry Clay.'

Webster, Ebenezer, American patriot, father of Daniel Webster (q.v.): b. Kingston, N. H., 1739; d. Franklin, N. H., 1806. In his youth he served under Gen. Amherst in the "old French war," and in 1761 was one of the original settlers of that part of the town of Salisbury now known as Franklin. He united, as was common at the time, the occupations of farmer and innkeeper, took an active part in public matters, and at the outbreak of the Revolution led the Salisbury militia to Cambridge. Subsequently he fought at White Plains and Bennington, and served in other campaigns until the close of the war, when he had attained the rank of colonel of militia. He was at various times a member of both branches of the legislature, and in 1791 was appointed judge of the court of common pleas, which office he held till his death. In personal appearance he resembled his son Daniel, being of a large frame, with a swarthy complexion and dark piercing eyes.

Webster, Henry Kitchell, American author: b. Evanston, Ill., 7 Sept. 1875. He was graduated from Hamilton College, Clinton, N. Y., in 1897, and in the following year was instructor in rhetoric at Union College. With Samuel Merwin (q.v.), he has written: 'The Short Line War' (1899); and 'Calumet "K"' (1901). His own work includes: 'The Banker and the Bear' (1900); 'Rogers Drake, Captain of Industry' (1903); etc.

Webster, Herbert Tracy, American eclectic physician and author: b. Portland Township, Chautauqua County, N. Y., 14 Oct. 1847. He was graduated at the Eclectic Medical Institute of Cincinnati in 1869, and in 1882 was appointed professor of materia medica in the California Medical College (now located at San Francisco), and now fills the chair of principles and practice of medicine in the same institution. He has written 'Principles of Medicine'; 'Dynamical Therapeutics,' and 'The New Eclectic Practice of Medicine.'

Webster, John, English dramatist: b. about 1580; d. about 1625. He appears to have followed the occupation of his father, a tailor, and in 1604 was a freeman of the Merchant Taylors' Company. In 1602 he began to write plays in collaboration with other playwrights, but attained to his full power only when, between 1607 and 1612, he adopted independent authorship. He added to 'The Malcontent,' a play by John Marston, and was associated with Dekker in writing the two vigorous prose comedies, 'Westward Ho' (acted 1604), and 'Northward Ho' (acted 1605). 'The White Devil,' or 'Vittoria Corombona,' a tragedy published in 1612, was his first independent work, and is now recognized as one of the best tragedies of its age. 'Appius and Virginia,' published in 1614, followed soon afterward, and in 1616 his masterpiece, 'The Duchess of Malfi,' was first produced at the Blackfriars Theatre. It was first published in 1623. This great tragedy, which has won enthusiastic praise from Charles Lamb and many subsequent critics of eminence, is based on a Neapolitan story found in Bandello. 'The Devil's Law Case' was published in 1623, and appears to have been Webster's last play. Of other plays sometimes ascribed in part to Webster, only 'A Cure for a Cuckold' (published 1661) seems to contain any of his work. Webster wrote in 1624 a pageant for the Lord Mayor of London, and in 1612 was associated with Heywood and Tournear in producing 'Three Elegies to the Memory of Prince Henry.' He also contributed verses to other works. There are editions of Webster's works by Dyce (1830; new eds. 1857 and 1886) and Hazlitt (1856). J. A. Symonds edited a selection in the 'Mermaid Series' in 1888, and there is an edition of 'The Duchess of Malfi' in the 'Temple Dramatists' by C. E. Vaughan (1896). Consult: Hazlitt, 'Dramatic Literature of the Age of Elizabeth' (ed. 1840); Vopel, 'John Webster: Researches on his Life and Plays' (1887); Gosse, '17th Century Studies' (1883); Swinburne, 'Studies in Prose and Poetry' (1894). Lamb was the earliest among 19th century critics to give due praise to Webster, and Swinburne enthusiastically places him next to Shakespeare among English dramatists.

Webster, Julia Augusta Davies, English poet and dramatist: b. Poole, Dorsetshire, 30 Jan. 1837; d. Kew, Surrey, 5 Sept. 1894. She was a daughter of Admiral George Davies, and was married to Thomas Webster, a fellow of Trinity College, in 1863. In 1879 she was elected to the London School Board. Her first work was published under a pseudonym, which she soon discarded, and her early inclinations led her to make translations from the Greek in which field she did admirable work. As a dramatic poet she takes high rank, but her verse appeals most nearly to highly cultured readers. Her works include: 'Dramatic Studies' (1866); 'Portraits' (1870); the dramas 'Disguises' (1879); 'In a Day' (1882) and 'The Sentence' (1887); 'The Medea of Euripides,' translation (1868); 'A Housewife's Opinions' (1878); 'Daffodil and the Croaxaxicans' (1884); etc.

Webster, Noah, American lexicographer: b. Hartford, Conn., 16 Oct. 1758; d. New Haven, Conn., 28 May 1843. In 1774 he entered Yale College, but his studies were interrupted by the outbreak of the Revolutionary War, in which

he served under his father as a volunteer. He was graduated in 1778, and was admitted to practise law in 1781, but the unsettled state of the country prevented his obtaining a suitable opening in his profession, and in 1782 he removed to Goshen, N. Y., where he taught a classical school. Soon after he published his 'Grammatical Institute of the English Language,' in three parts, Part 1 (1783) containing 'A New and Accurate Standard of Pronunciation'; Part 2 (1784), 'A Plain and Comprehensive Grammar'; Part 3 (1785) 'An American Selection of Lessons in Reading and Speaking.' The first part of this work afterward became popularly known as 'Webster's Spelling-book.' In 1889 it was stated that 62,000,000 copies of the work had then been published. His literary activity was henceforth very great, and among works issued by him during the next few years are 'Sketches of American Policy' (1784-5), an argument for the formation of a national constitution. In 1787, after the adjournment of the Constitutional convention, he published the pamphlet, 'Examination of the Leading Principles of the Federal Constitution'; and 'Dissertations on the English Language' (1789). He began the practice of law at Hartford in 1789, but removed in 1793 to New York, where he established a daily paper, the *Miner* (later *The Commercial Advertiser*), for the purpose of supporting the government. He published in 1794 a pamphlet on the 'Revolution in France,' and wrote ten essays under the signature of 'Curtius,' in favor of the Jay treaty with Great Britain. These publications had a powerful influence in stemming the tide of feeling in favor of a French alliance. In connection with the visitation of yellow fever he made a special study of the history of pestilential diseases, and wrote a work on contagious diseases which was published in England and America in 1799. In the previous year he had removed to New Haven. In 1802 he published 'Historical Notices of the Origin and State of Banking Institutions and Insurance Offices.' His great work was the 'American Dictionary of the English Language.' He devoted many years to the collection of new words and preparation of more free and exact definitions. In 1824, when the book was nearly finished, he visited Europe to procure such information as he had been unable to obtain in America. After a short stay in Paris he went to England, where he finished his dictionary during an eight months' residence in Cambridge. In June 1825, he returned to America. An edition of 2,500 copies of his dictionary was published in 1828, followed by an edition of 3,000 in England under the superintendence of E. H. Barker. The work contained 12,000 words and 40,000 definitions not to be found in any similar publication. In 1840-1 he published a second edition in two volumes, with extensive additions to the vocabulary and corrections of definitions. His 'Collection of Papers on Political, Literary and Moral Subjects' was a reprint of some of his earlier writings. Webster was throughout life associated with many of the most eminent men of the country, and always took an active share in public life, supporting his party chiefly by his pen. Several enlarged and improved editions of his dictionary have been published since his death both in America and in England, and it has always held its place as a standard work.

Among his further writings are: 'Letters to Dr. Priestly' (1800); 'Origin, History and the Connection of the Languages of Western Asia and of Europe' (1807); and a 'History of the United States' (rev. ed. 1838). Consult the 'Life' by Scudder (1882) in the 'American Men of Letters' series.

Webster, Sir Richard Everard, 1st Baron ALVERSTONE, English jurist: b. 22 Dec. 1842. He was educated at Cambridge, was called to the bar in 1868, became queen's counsel in 1878 and was attorney-general in Lord Salisbury's cabinet in 1885-6, 1886-92, and 1895-1900. He was returned to Parliament for Launceston in 1885, and in 1885-1900 was member for the Isle of Wight. He was knighted in 1885, created a baronet in 1900 and in that year was raised to the peerage. In 1893 he was one of the British representatives before the Bering Sea Arbitration Tribunal. He was Master of the Rolls, May-October 1900, and was then appointed chief justice. He served as a member of the Alaskan Boundary Tribunal in 1903.

Webster, Mass., town in Worcester County; on the French River, and on the New York, N. H. & H., and the Boston & A. R.R.'s; 15 miles south of Worcester. It is in an agricultural region and has considerable industrial interests connected with farm products. A lake (1,225 acres) is one of the attractions of the town. It has cotton and woolen mills, shoe factory, and machine shops. It has a good water system. There are 11 churches, a high school, 13 graded public schools, three graded parish schools, and a public library. There is one national and one savings bank. The savings bank has deposits amounting to about \$2,000,000. The government is administered by annual town meetings. Webster was set off from Dudley and Oxford and in 1832 was incorporated. Pop. (1910) 11,509.

Webster-Ashburton Treaty, The, in American history, a treaty between the United States and Great Britain, negotiated by Daniel Webster and Lord Alexander Baring Ashburton in August 1842. By this treaty the frontier line between the State of Maine and Canada was definitely agreed to. By this agreement seven twelfths of the disputed ground, and the British settlement of Madawaska, were given to the United States, and only five twelfths of the ground to Great Britain; but it secured a better military frontier to England, and included heights commanding the Saint Lawrence, which the award of the king of Holland, who had been chosen arbiter, had assigned to the Americans. By the 8th and 9th articles, provisions are made for putting an end to the African slave-trade; and the 10th article provides for the mutual extradition of suspected criminals. See TREATIES; UNITED STATES—ARBITRATION IN THE.

Webster City, Iowa, county-seat of Hamilton County; on the Boone River, and on the Webster City & S., the Chicago & N., and the Illinois C. R.R.'s; about 70 miles north of Des Moines. It is in an agricultural region, in which there are a number of coal mines. It has a shoe factory, foundry, machine shops, iron furnaces, flour mill, grain elevators, and large coal yards. It has a high school, graded public and parish schools. The four banks have a com-

bined capital of \$275,000 and deposits (1903) amounting to \$1,210,000. Pop. (1880) 1,248; (1890) 2,829; (1900) 4,613; (1910) 5,208.

Webworms, a name applied to various species of caterpillars or lepidopterous larvæ because of their habit of spinning webs of silk enclosing leaves upon which they feed and also serving as a shelter. As a rule neither the web-spinning nor the social habit is so highly developed as in the tent-caterpillars (q.v.), but there is no sharp distinction in the application of the two names. The species of caterpillars exhibiting such habits are quite numerous and belong to a number of genera and families of moths (q.v.). Some of them are of considerable economic importance. The fall webworm is the larva of the small white moth (*Hyphantria cunea*). As soon as they leave the egg all of the larvæ hatching from a mass spin a common web enclosing several leaves. After these are eaten the caterpillars wander farther and farther in search of food, sometimes destroying the entire foliage of a tree, but always return to the shelter of the nest to rest when not feeding. The web may be extended to include whole branches. The caterpillars are covered with long hairs, and there are two broods, one in the spring and one in the fall, the latter being unusual among species of similar habit, wherefore the name. All kinds of shade and ornamental trees suffer from their attacks. As typical of a large and quite distinct group of caterpillars is the garden webworm (*Loxostege similalis*). This is a small, nearly naked caterpillar, which feeds in company on all kinds of garden vegetables, the leaves of which are drawn together in small webs. Some of the related species form large colonies and one small form is often very destructive to dried clover hay. The root webworms are the caterpillars of the little roll-wing moths. *Crambus vulvivagellus* is a common species which spins a web about the stalks and roots of grass to which, as well as to corn, it is sometimes very destructive. The true tent-caterpillars (q.v.) belong to the genus *Clisiocampa* and family *Bombycidae* or silk-spinning moths. A quite unrelated species is *Catania cerasivorana*, which forms veritable silken tents, sometimes covering small trees entirely. The general method of combating webworms is to destroy their eggs in winter, to burn the newly-formed tents, and to spray the foliage about the tents with arsenical solutions. The ground-webs may be checked by fall plowing.

Consult: Harris and Flint, 'Insects Injurious to Vegetation' (New York 1884); and publications of the U. S. Department of Agriculture.

Wedderburn, wêd'ér-bérn, Alexander, BARON LOUGHBOROUGH and 1st EARL OF ROSSLYN, British politician: b. Edinburgh 13 Feb. 1733; d. near Windsor, England, 2 Jan. 1803. He was educated at the University of Edinburgh, was called to the English bar in 1757, entered Parliament in 1761 as member for Ayr, and subsequently represented various constituencies. He pleaded the great Douglas case in 1768-89, and in 1771 left the ranks of the opposition to become a firm supporter of Lord North, who had appointed him solicitor-general. He strenuously opposed the claims of the American colonists, defending the policy of Lord North throughout

WEDDERBURN — WEDGWOOD WARE

the American war. He was made chief justice of the court of common pleas in 1780, at the same time being raised to the peerage as Baron Loughborough, and in 1783 assisted in forming the coalition ministry, but in 1784 he joined the forces of Fox. He subsequently made friends with Pitt and gained from him the place of lord chancellor, after which he joined the supporters of George III. Upon his retirement from the chancellorship in 1801 he was created Earl of Rosslyn.

Wedderburn, James, Scottish psalmist: b. Dundee, Scotland, about 1500; d. England, about 1564. He studied at the University of Saint Andrew, became interested in the Scottish Reformation, and fled to France to escape prosecution as a heretic. He edited, with his brothers Robert and John, the principal song book used in Scotland, 'Ane Compendius Buike of Godly and Spirituall Songs, Collectit Out of Sundrie Partes of the Scripture, wyth Sundrie of Uther Ballates Changed Out of Prophane Songs, for Avoyding of Sinne and Harlotrie' (about 1548). Later editions of this work have been edited by David Laing (1868) and Mitchell (1897). He is also credited with the authorship of 'The Complaynt of Scotland' (1548), 'the only classic work in old Scottish prose.' Consult Mitchell, 'The Wedderburns and Their Work' (1898).

Wedding Anniversaries, or celebrations held as follows: The Cotton wedding, 1 year; the Paper wedding, 2 years; the Leather wedding, 3 years; the Wooden wedding, 5 years; the Woolen wedding, 7 years; the Tin wedding, 10 years; the Silk and Fine Linen wedding, 12 years; the Crystal (Glass) wedding, 15 years; the China wedding, 20 years; the Silver wedding, 25 years; the Golden wedding, 50 years; the Diamond wedding, 75 years.

Wedding Ceremonies. See MARRIAGE.

Wedge, a piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, etc. The wedge is one of the mechanical powers, and besides being used for splitting purposes, is used for producing great pressure, as in the oil-press, and for raising immense weights, as when a ship is raised by wedges driven under the keel. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome as the breadth of the back to the length of the side, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration.

Wedgwood, wĕj'wud, Josiah, English potter: b. Burslem, Staffordshire, 12 July 1730; d. Etruria, Staffordshire, 3 Jan. 1795. He was the

son of a potter in the district and on the death of his father was employed in the pottery at nine. An incurable lameness later compelled him to give up the wheel and he removed for a time to Stoke, where he entered into partnership with other potters and where his talent for ornamental pottery was first displayed. In 1759 he returned to Burslem, and set up a small manufactory of his own, in which he made white stoneware, and the cream-colored ware for which he became so famous. He presently succeeded in producing a ware so hard and durable as to render works of art produced in it almost indestructible, and also in executing paintings on pottery without the artificial gloss so detrimental to the effect of superior work. In 1771 he erected potteries at Etruria, a village which he founded for his workmen. His improvements in pottery, which included form, substance, and decoration, in all of which he attained an excellence rarely equaled, created the great trade of the Staffordshire potteries, which even during his lifetime acquired a remarkable expansion. He made 50 copies of the Portland vase, which were sold for 50 guineas each, a sum which it is said did not cover his expenditure in their production. (See POTTERY; WEDGWOOD WARE.) Consult: Jewett, 'The Wedgwoods' (1865); Eliza Meteyard, 'Life' (1860); Rathbone, 'The Masterpieces of Old Wedgwood Ware' (1892-3); 'Life,' by Smiles (1894).

Wedgwood Pyrometer, in physics, a pyrometer in which temperature is ascertained by the contraction of baked clay, measured before and after its subjection to the action of heat.

Wedgwood Ware, a variety of English pottery first made by Josiah Wedgwood (q.v.), in which artistic designs and treatment were combined with mechanical and technical excellence. There were six distinguishing kinds of this ware, arranged in the order of their invention as follows: (1) Cream-colored ware, called Queen's ware, in various hues of cream color, saffron, and straw. (2) Egyptian black, or basaltic ware, used for seals, plaques, life-size busts, medallion portraits, etc. (3) Red ware, or Russo antico. (4) White semi-porcelain, or fine stoneware, differing from the white jasper in its pale straw-colored or grayish hue, and in its waxlike smooth surface and sub-translucency. (5) Variegated ware, of two kinds, one a cream-colored body, marbled, mottled, or spangled with divers colors upon the surface and under the glaze; the other an improved kind of agate ware, in which the colored clays in bands, twists, stripes, and waves constituted the entire substance. (6) Jasper ware, in which the chief triumphs of Wedgwood were wrought, resembling outwardly the finest of his white terra-cotta and semi-porcelain bodies. One of his earliest recipes for this last-named ware was, in percentage, barytes, 57.1; clay, 28.6; flint, 9.5; barium carbonate, 4.8; the novelty of these components being the use of the barytes and barium carbonate. A very little cobalt was occasionally added, even to the white jasper ware, to neutralize the yellowish hue, and by introducing a little Cornish stone or other felspathic material it became less opaque and more wax-like.

There are seven colors in Wedgwood ware besides the white—blue of various shades, lilac,

pink, sage-green, olive-green, yellow, and black—and it is remarkable for the absence of bubbles and holes, the flatness of the field, and the uniformity of grain. It was produced in numberless forms—cameos, intaglios, portrait medallions, statuettes, vases, etc., and the yellow variety is rare. Wedgwood's artistic work consists not only in copies of antique gems and in the adaptation of antique designs, but in the original productions of many English and foreign draughtsmen and modelers.

Wedmore, Frederick, English author: b. Richmond Hill, Clifton, England, 9 July 1844. He was educated in France, has been art critic on the London *'Standard'* since 1878, and has published an edition of Michel's *'Rembrandt'*; *'Poems of the Love and Pride of England'* with his daughter Millicent. Among works of his own are: *'Pastorals of France'* (1877); *'Life of Balzac'* (1890); *'Studies in English Art'* (1876; 1880); *'On Books and Art'* (1899); *'The Collapse of the Penitents'*, a novel; *'Turner and Ruskin'* (1900); etc.

Wednesbury, wēnz'bū-rī, England, a manufacturing town in Staffordshire, 19 miles south-southeast of Stafford. The Gothic parish church stands on the summit of a hill at the northern extremity of the town; there are several other churches and chapels, a town hall, free library, a mechanics' institute, public baths, a benevolent society, an alms-house, and several schools. The principal manufactures are railway carriages, patent axles, and general ironwork for railways; steel tubing for gas and water, and steam pipes; gun locks and barrels, springs for coaches, hinges, nails, screws, spades, shovels, edge tools, and wrought iron work of every description. Pop about 29,000.

Wednesday, the fourth day of the week. The Germans call it *Mittwoch* (mid-week). The English name is derived from the old Scandinavian deity Odin or Woden. In Anglo-Saxon it is *Wodnesdag*; in Swedish, *Odensdag*; in Dutch, *Woensdag*. See also **ASH-WEDNESDAY**.

Weed, Clarence Moores, American zoologist: b. Toledo, Ohio, 1864. He was graduated from the Michigan Agricultural College in 1883 and is at present (1904) professor of zoology at New Hampshire College. He has written: *'Insects and Insecticides'* (1893); *'Ten New England Blossoms and Their Insect Visitors'* (1895); *'Seed Travelers'* (1898); *'Insect World'* (1899); *'The Flower Beautiful'* (1903); *'The Nature Calendar Series'* (1900-3); etc.

Weed, Edwin Gardner, American Protestant Episcopal bishop: b. Savannah, Ga., 23 July 1837. He was educated at the University of Georgia and studied theology at the General Theological Seminary whence he was graduated in 1870. He took priest's orders in the Episcopal Church in 1871 and was rector of the Church of the Good Shepherd, Summerville, Ga., 1871-86. In the year last named he was consecrated bishop of Florida.

Weed, Stephen Hinsdale, American soldier: b. New York 1834; d. near Gettysburg, Pa., 2 July 1863. He was graduated from West Point in 1854, served on the Texan frontier and in the Florida wars of 1855-7, receiving rank as lieutenant in 1856, and in 1858-61 he was on

duty in Kansas and Utah. In 1861 he was promoted captain and assigned to the command of a battery in the Army of the Potomac. He was engaged in the Maryland, Peninsular and Northern Virginia campaigns, and fought at Manassas, Antietam, and Chancellorsville, receiving promotion to brigadier-general of volunteers for gallantry at the latter. He commanded a brigade of artillery at Gettysburg 2 July 1862, and was killed while holding Little Round Top against the terrific onslaught of the Confederates. The place where he fell is now called *'Weed's Hill.'*

Weed, Thurlow, American journalist and political leader: b. Cairo, Greene County, N. Y., 15 Nov. 1797; d. New York 22 Nov. 1882. He entered a printing office at 14, but left his trade for a time to serve in the army during the War of 1812; in 1815-19 he worked as a printer in New York; and in 1819 went to central New York State, where he established and edited successively *'The Agriculturist'* at Norwich, and the *'Onondaga County Republican'* at Manlius. In 1822 he became editor of the *Rochester Telegraph*, a daily paper, and later its proprietor. During the Anti-Masonic excitement he stopped the publication of the *Telegraph*, and issued the *Anti-Masonic Enquirer*. He was twice elected to the State Legislature on the Anti-Masonic ticket, and while in Albany became noted as a shrewd political manager. In 1830 he moved to Albany and established the *Albany Evening Journal*, which he edited till 1865. This paper was first used as a means of attacking the Albany *'Regency,'* a body of politicians under the leadership of Martin Van Buren, and it soon became the leading journal of the Whig party in the State. Through the influence of this paper and his political skill, Weed became the dominant State manager of the Whig, and later of the Republican, party. He held no public office himself, but for many years practically controlled the nominations for State officers; his control being used as a rule for the public good; some of the most efficient governors of the State were elected under his management. He also took a leading part in national politics as early as 1824, and when J. Q. Adams was nominated for the presidency was instrumental in uniting the Clay and Adams factions; was particularly influential in securing the nomination of Harrison in 1840, Clay in 1844, and Taylor in 1848; and materially aided in the nomination of Scott in 1852 and Frémont in 1856. In 1860 his first choice for the presidency was Seward, but he loyally supported Lincoln after his nomination, and urged his renomination in 1864. Weed had long been a personal friend of Seward, and was for some time closely associated with Seward and Greeley in what was known as *'the political firm of Seward, Weed and Greeley.'* In 1861 he went to Europe on a diplomatic mission to place the North in a favorable light before foreign governments, and to prevent their intervention in behalf of the South. After 1865 he was for a time a member of the editorial staff of the *New York Times*; in 1867-8 was editor of the *Commercial Advertiser* in New York. His health then forced him to resign continuous journalistic work, but he continued to write occasionally for newspapers and periodicals, and though he took no active part in politics, his advice was sought by Republican leaders, and

WEED--WEEK

had no small influence in shaping the policy of the party. He published 'Letters from Europe and the West Indies' (1866); and prepared his 'Autobiography,' which was published after his death (1884). Consult: Barnes, 'Mémorial of Thurlow Weed' (1884).

Weed, Walter Harvey, American geologist: b. Saint Louis, Mo., 1 May 1862. He was graduated from the Columbia School of Mines in 1883, and in that year was appointed to the United States Geological Survey. In 1883-9 he was engaged in Yellowstone Park, where his investigations proved that the colors in hot springs and deposits in geysers are due to algae, and he also discovered Death Gulch in that park. He was occupied in a general geological exploration of Montana in 1889-98, and in 1899 published his theory of secondary enrichments of ore deposits. He was appointed commissioner and expert on copper at the Louisiana Purchase Exposition in 1904. His publications include: 'Glaciation of Yellowstone Park' (1893); 'Secondary Enrichment of Mineral Veins' (1899); etc.

Weed'en, William Babcock, American manufacturer and economic and historical writer: b. Bristol, R. I., 1 Sept. 1834. He studied at Brown University, and then engaged in the manufacture of woolen goods in Providence. In 1861 he joined the Union army as 1st lieutenant of artillery; was promoted captain after the first battle of Bull Run; was present during the siege of Yorktown, and took part in the engagements at Hanover Court House, Mechanicsville, Gaines' Mill, and Malvern Hill. In August 1862 he resigned and resumed business in Providence. His publications include: 'Morality of Prohibitory Liquor Laws' (1875); 'Social Law of Labor' (1882); 'Economic and Social History of New England, 1620-1789' (1890).

Weeds are plants growing where they are not desired. There are no plants which are weeds, *per se*, since in nature each plant has its place, and since in cultivated areas any plant, useless or useful, may become a weed. Thus grass would be considered a weed in a bed of garlic, and *vice versa*. Many plants, however, are popularly dubbed weeds because they are troublesome in fields and gardens, but even among these are not a few which are cultivated; for instance, purslane, lamb's quarters, and sorrel. Far from being the useless and obnoxious things that they have long been reputed to be, weeds have performed a distinct service, which they still continue, in agriculture; they have compelled the husbandman to practise clean cultivation, upon which the success of his crops very largely depends.

Weeds often must be eradicated upon land that has become foul under neglect. Upon pastures and lawns that commence to fail the two principal ways of management are to make more grass grow or to plow the land and grow some other crop upon it for a year or more. The former is usually more feasible with lawns; the latter with meadows and pastures. Often a re-seeding to grass will be sufficient. The plantain, dandelion, and similar weeds troublesome in lawns may be cut out individually, but to keep them out the growth of grass must be encouraged by sowing extra seed and by fertilizing. In

land that has lain fallow the annual weeds may be destroyed by frequent cultivation; biennial and perennial weeds, by short rotations of crops, especially such as include intertillage crops, like potatoes, beans, and turnips. The one necessity to observe in combating perennial weeds is to prevent their forming leaves and thus elaborating food. In low grounds where sedges, rushes, and bracken often abound, the land may be rid of these weeds by draining. In gardens many weeds may be "smothered" by growing leafy crops which will shade the ground. Ground which is kept free from weeds in the early months may become choked with weeds toward autumn and these may re-seed the ground for the following year. Mowing before the plants blossom, or plowing the ground are often practised. In some cases, however, the plants may be allowed to remain as a cover crop to prevent the washing of the soil during winter. This practice is most common in orchards. A cover crop sown by the orchardist is preferable.

Beside the usual means of seed dispersal, such as wind and water, weeds are frequently distributed by means of baled hay, manure, and imperfectly cleaned seeds of the crops sown. This last is particularly prevalent with such difficultly cleaned seeds as grass and clover. Hence the advisability of purchasing only the best seeds. It is not remarkable that many of the most troublesome weeds are imported from foreign countries, because being removed from their natural controls they find less resistance and spread accordingly.

Weeds are often of service in aiding the farmer to judge the needs of his land, since many kinds grow only where the conditions are peculiarly adapted to them. The character of their growth also indicates the quality of the soil. Wild carrot and the ox-eye daisy grow only upon poor soils, or soils that have been robbed of their fertility. Sheep sorrel indicates acid land and the necessity of applying lime to "sweeten" the soil. Bracken, sedge, and moss show that the land needs drainage. Dark green foliage and large size of plant and leaf are good indications of abundant nitrogenous plant food in the soil; and yellowish foliage and sparse, stringy growth shows lack of this material.

Weehawken, wē-hā'kēn, N. J., town in Hudson County; on the Hudson River, and on the New York, Ontario & Western and the West Shore R.R.'s; opposite New York. It is one of the largest, if not the largest, coal depot in the United States. It has the coal docks and freight sheds of the Erie Railroad Company, and the coal docks of the Delaware and Hudson Canal Company and the Pennsylvania Company. It has several manufacturing establishments. Two of the Hackensack Water Company reservoirs are located here. Weehawken is known as the dueling place of Alexander Hamilton and Aaron Burr. Pop. (1890) 1,943; (1900) 5,325; (1910) 11,228.

Week, a period of seven days, one of the common divisions of time. The week is not a natural division of time, and the question when, why, and by whom it was first adopted necessarily arises in connection with its actual prevalence. The only natural explanation offered is that it has been adopted as a quarter lunation; but as there is no absolute necessity for dividing the month into four, and a large fraction is

needed to make the weekly square with the lunar periods, this explanation is not satisfactory. The week is, in fact, a much closer division of a year than of a month; but the division of the year into 52 portions is so purely arbitrary that this can hardly suggest the origin of the week. The convenience of some short recurring period or cycle of days is obvious, and it is the prevalence alone, and not the occurrence of a particular cycle, that has to be accounted for. The practice of antiquity on the subject does not seem to have been so uniform as is sometimes supposed. Among the nations who adopted the week as a division of time, the Chinese, Hindus, Egyptians, Chaldeans, Jews, Persians, and Peruvians have been mentioned, but in some cases the antiquity of the practice is doubtful, and in others the name has been applied to other cycles than that of seven days. The nations with whom the weekly cycle has been traced with certainty to the greatest antiquity are the Egyptians and the Hebrews. With the former we only know of its existence, but with the latter it had a much more important character. Their earliest records speak of its existence, and refer it to a period previous to that of the nation itself. Laban, the uncle of Jacob, alludes to the week as an established measure of time in Gen. xxix. 27. The origin of the week is further ascribed in the Jewish Scriptures to the creation of the world, and is wrought into the institutions of the nation in a variety of ways, but particularly by the consecration of the seventh day to the worship of the Creator. The Hebrew word for week is of a general signification, and applies equally to a period of seven days, seven months, and seven years, each of which had a particular celebration attached to it in the Hebrew ritual, hence the use of days to represent years in the prophetic writings is according to the natural genius of the language. The number seven had a mystic significance attached to it in the symbolism of the Jewish religion in a variety of other ways. The Romans and Greeks each divided the month into three periods (see *CALENDAR*), and were not acquainted with the week till a late period. The Romans, however, had for civil uses, as the arrangement of market-days, a cycle of eight days, the ninth day being the recurring one, instead of the eighth, as with us. The use of the week was introduced into the Roman Empire about the first or second century of the Christian era from Egypt, and had been recognized independently of Christianity before the Emperor Constantine confirmed it by enjoining the observance of the Christian Sabbath. The names given by the Romans to the days of the week, and which have pervaded Europe, were derived from the planetary system, which was supposed to consist of the sun, moon, and five planets, Mars, Mercury, Jupiter, Venus, and Saturn. With the Mohammedans the week has also a religious character, Friday being observed by them as a Sabbath. It is supposed by some authorities that they introduced the week to India. The Chinese week is said to consist of five days, named after the five elements, iron, wood, water, feathers, and earth. See articles on the different days of the week.

Weekes, wēks, Henry, English sculptor: b. Canterbury 1807; d. 29 May 1877. He was for many years the principal assistant of the sculptor Chantrey, was elected to the Academy

in 1863 and became professor of sculpture there in 1873. Besides the earliest bust of Queen Victoria (1837) he executed statues of Latimer, Cranmer, Bacon, Charles II., and others.

Weeks, Edwin Lord, American artist: b. Boston 1849; d. Paris 17 Nov. 1903. He was a pupil of the Beaux-Arts (Paris), of Gérôme, and Bonnat, and sketched and painted in Cairo, Jerusalem, Damascus, Tangier, and other parts of the Orient, obtaining there material for the genre-scenes from Eastern life with which he won his reputation. A frequent exhibitor at the Salon, he obtained honorable mention there in 1885. Among the other distinctions which he received were the diploma of honor at the Berlin international exhibition in 1891, and a special medal and prize in 1896 at the Empire of India exhibition (London). Specimens of his work are in the Pennsylvania Academy of Fine Arts, Philadelphia, and the Corcoran Gallery of Washington. Among his paintings are: 'A Cup of Coffee in the Desert'; 'Jerusalem from the Bethany Road'; 'Pilgrimage to the Jordan'; 'Scene in Tangier'; 'Arab Story-Teller' (exhibited at the Centennial Exhibition, Philadelphia, 1876); 'Departure for the Hunt—India'; 'Moorish Camel-Driver.' He also wrote 'From the Black Sea Through Persia and India' (1895), and 'Episodes of Mountaineering' (1897).

Weeks, Feast of (Heb. *Shabwoth*), a name employed by the Jews for the second of the great Hebraic religious festivals. It is thus called from the fact that it forms the culmination of the seven weeks succeeding the Passover feast. Primarily it appears to have been connected with the celebration of the end of the harvest, but later also with the giving of the Law on the fiftieth day after the departure from Egypt. In the New Testament it is called Pentecost (q.v.), the Greek word (*πεντηκοστή*) signifying fiftieth (from *πεντα*, day).

Weems, wēms, Mason Locke, American Protestant Episcopal clergyman: b. Maryland about 1760; d. Beaufort, S. C., 23 May 1825. He began the study of medicine, but gave it up and went to London, where he was educated for the clerical profession, but found no bishop in England to admit him to holy orders. There was then no Anglican bishop in America, and the professional plans of Weems were obstructed by peculiar difficulties. (For an account of them see McMaster's 'History of the People of the United States', Vol. I.) Returning to this country, he preached at different places, apparently never having a regular charge, although it has been said that the rectorship of Mount Vernon parish (there was no such parish) was held by him before the Revolution, as claimed by himself; also that he officiated in the old Pohick Church, of which Washington was an attendant, which indeed he may have done, but not until long after Washington's attendance there had ceased. About 1790 he became a book agent for Mathew Carey (q.v.), and traveled through the South selling works, some of which were his own. He made himself popular by exercising his talents for comedy and his skill with the violin, probably diverting and (through his sermons) exhorting the people by turns. A book of his own writing which he offered for sale was 'The Drunkard's Looking Glass, Reflect-

ing a Faithful Likeness of the Drunkard in Sunday Very Interesting Attitudes, with Lively Representations of the Many Strange Capers which he cuts in Different Stages of His Disease' (6th ed. 1818). His 'Life of Washington,' by which he is best known, first appeared in 1800, and during the 19th century the number of its editions exceeded 70. The traditional conception of Washington rests mainly upon this work, as do the story of the cherry-tree and other anecdotes which historians reject, most of which first appeared in the 5th edition (1806). His other publications, all more or less tawdry and inaccurate, include: 'Life of General Francis Marion' (1805). 'The Philanthropist, or Political Peacemaker Between All Honest Men of Both Parties' (10th ed. 1809); 'God's Revenge Against Gambling' (3d ed. 1816); 'Life of Benjamin Franklin with Essays' (1817); 'Life of William Penn' (1819); 'Hymen's Recruiting Sergeant, or the New Matrimonial Tattoo for Old Bachelors' (7th ed. 1821); and 'The Bad Wife's Looking Glass, or God's Revenge Against Cruelty to Husbands' (2d ed. 1823).

Weenix, Jan, yān vā'nīks, THE YOUNGER, Dutch painter, son of the following: b. Amsterdam 1644; d. there 20 Sept. 1719. He painted landscapes, animals, flowers, and fruit, but excelled in the representation of dead game and hunting scenes. His pictures of this class are unrivaled by any productions of the Dutch school, and command large prices. He finished with extreme neatness, and exhibited a clear and brilliant coloring and a wonderful knowledge of chiaroscuro.

Weenix, Jan Baptist, Dutch painter: b. Amsterdam 1621; d. Ter May, near Utrecht, 1660. He was instructed by Abraham Bloemart and Nicolas Moijert, and at 22 visited Rome, where he acquired a reputation by his Italian seaports and landscapes with architectural accessories. The last 12 years of his life were passed in Holland. He was a rapid painter, having been known to finish three half-length portraits with accessories in a single day, and excelled in history, portrait, animal, landscape, and marine painting, being on the whole most distinguished in the last named department.

Weeping Cross, a cross of stone or wood, erected at the side of a road, at which penitents prayed and wept for their sins. Hence the old English saying, 'To return by weeping cross,' that is, to return in sorrow from some message or undertaking. As these crosses were removed in England when that country became Protestant, the saying is now obsolete, but is met with in old writers.

Weever (variant of weaver, or of the obs. *wiwer*, from Lat. *vīpera*, viper), a fish of the genus *Trachinus*, two species of which are recognized: *T. vīpera*, 5 to 6 inches in length, and *T. draco*, 10 to 12 inches. These fishes possess sharp opercular and dorsal spines, with which they can inflict a painful wound. The sting is believed not to be poisonous, but it is very similar to that of the sting-ray (q.v.). The name weever is hence applied to any of the *Trachinidae* (q.v.).

Weevil, a general name applied not only to various genera of adult beetles but also to their larvæ. They form a group *Rhyncho-*

phora, or snout-beetles, so called from the characteristic production of the head in the form of a prominent snout, bearing the elbowed antennæ at the sides and the small mouth at its tip. There are several families, but most of these beetles belong to the Curculionidae, which is said to include upward of 600 genera and 20,000 species. All of them are vegetarians and the larvæ are little white or yellow, fat, footless grubs which mostly live within the tissues of plants, and are especially destructive to nuts, seeds and fruits. One of the most conspicuous and harmful is the cotton boll weevil, *Anthonomus grandis*. It is about one-fifth of an inch long and may be differentiated from related species by the fact that the tibiae of the first pair of legs are provided with two small spines. Immediately after transforming from the pupal state the color is reddish but some time after emergence the color becomes considerably darker. The grub-like larvæ are considerably longer than the adults, strongly curved, white with pale yellowish heads. The eggs are deposited in punctures made by means of the beak of the female weevil in the buds (called squares) and bolls. The larvæ devour the interior. Infested squares practically invariably fall to the ground but bolls always remain attached to the plant. In the case of the squares, of course, the fruit is ruined. In case of bolls only the infested like or apartment is destroyed. The life cycle is completed in about 20 days and there is an inextricable confusion of generations. The winter is passed in the adult stage, the individuals flying to the woods or seeking shelter in debris around or inside of the cotton fields.

This insect, probably originated in Central America. It was introduced into the United States near Brownsville, Texas, about 1892. By 1895 it became established as a serious pest and has continued to spread northward and eastward. It has now extended about 585 miles northward from Brownsville and to a point within 10 miles of the Mississippi River in Louisiana. Five counties in southwestern Arkansas have also become invaded. Efforts to stay the progress of the weevil have been unavailing, but an effective method of mitigating its damage has been perfected. The methods of destroying or controlling recommended by the Department of Agriculture are the removal of the plants from the fields in the fall when there is no prospect of any more fruit being allowed to mature; early planting, the use of early maturing varieties, the application of fertilizers and intensive cultivation.

The grain-weevil (*Sitophilus granarius*) is a little beetle of a dark red color, and about ¼ inch long. The eggs are deposited on wheat after it is stored, and the larvæ burrow therein, each larva inhabiting a single grain. The rice-weevil (*S. oryzae*) destroys rice and Indian-corn in a like fashion. This latter species has four red spots on the elytra or wing-covers. Another species (*Calandra palmarum*) infests palm-trees. It is common in Guiana, and attains a length of two inches, the larvæ burrowing in the pith of the trees. *C. sacchari* inhabits sugar-canes. The genus *Rhynchites*, of which the grape-weevil (*R. bacchus*) is an example, as the head broad behind. This species devas-

tates the growing vines, and strips them of their leaves. The plum curculio (*Conotrachelus nenuphar*) causes great damage to plums, cherries, and other stone fruits. The eggs are laid one at a place in the young, forming fruit, upon the flesh of which the larva feeds, causing it to drop prematurely or to become "wormy." The beetle is less than one fifth of an inch long and dark brown spotted with black and yellow. The familiar chestnut-worm is the larva of *Balaninus rectus*, remarkable for the great length of the snout, which exceeds the short robust body and which is adapted for piercing the thick burrs of the young chestnuts, permitting the deposition of an egg in the kernel. Related species of the genus infest other nuts. Equally troublesome to fruit-growers are the species of *Anthonomus*, of which one pretty little species (*A. signatus*) causes great damage to the Sharpless and other staminate varieties of strawberry. This species attacks the flowers, and the larvæ feed upon the pollen. Still quite different in its habits is the potato weevil or potato-stalk borer (*Trichobaris trinitata*), the larva of which bores passages in the stems of potatoes and wild plants of the same family. The clover-weevil (*Phytosomus punctatus*) has green larvæ which differ from all of the foregoing in living exposed to the air and light, though they feed chiefly at night. They eat the leaves and as they hibernate in the ground and begin to feed almost as soon as the clover sprouts in the spring they become most serious pests. The imagoes are nearly $\frac{1}{3}$ inch long, thick-bodied and short-snouted, with strongly knobbed antennæ.

To the family *Bruchidae* belong the extremely destructive pea and bean weevils, which have the proboscis short and curved down on the breast and the antennæ not elbowed. They are small beetles with stout bodies and the swollen abdomen often projecting beyond the tips of the wing-covers. Unlike the Curculionidæ, which become quiescent and assume an appearance of death, these beetles are extremely active and fly when disturbed. The larva of the pea-weevil (*Bruchus pini*) damages peas, the eggs being laid when the peas are ripening. They destroy much of the substance of the grain, lessen its germinating power and pupate in its interior. The mature insect is of a black color, marked with white spots, and about $\frac{1}{4}$ inch long. The *B. pini* was at one time so destructive in North America that its ravages threatened to wholly exterminate the pea crops. Several species are named corn-weevils, from their destructive effects in granaries. *B. granarius* also attacks peas, and one species infests the cocoanut. The bean-weevil (*B. fabæ*) is plain brown in color but otherwise similar.

Weevils are very difficult to control on account of their small size, inconspicuousness, and the fact that the destructive larvæ are generally beyond the effective reach of insecticides. The best measures consist in the total destruction by burning of all infested fruits, nuts, or stems, the digging or plowing in the late fall of the ground in which the pupæ hibernate, and in the case of the pea and bean weevils the fumigation with carbon bisulphide of all infested seed.

Consult: Harris and Flint, 'Insects Injurious to Vegetation' (New York 1884); Saunders, 'Insects Injurious to Fruits' (Philadel-

phia 1883); Smith, 'Economic Entomology' (Philadelphia 1896).

Weeyot. See WISHOSKAN.

Wei-Hai-Wei, wā'h'i'wā', China, a seaport and British naval and coaling station, in the province of Shantung, near the eastern extremity of the Shantung peninsula, 40 miles east of Chee-foo. It lies on the south shore of the entrance to the Gulf of Pe-chi-li, opposite Port Arthur on the north shore, about 100 miles distant. During the Chino-Japanese war, the Japanese destroyed a Chinese fleet here and captured the town, which they evacuated early in 1898. By a convention of 1 July 1898 the port of Wei-hai-wei, together with the adjacent waters and some neighboring territory, was leased to Great Britain for so long a period as Russia shall hold Port Arthur (q.v.). The leased territory includes the island of Liu Kung, all the islands in the bay, and a belt of land to miles wide along the whole coast of the bay; area, 280 square miles; pop. 120,000. By the terms of the lease Great Britain has sole jurisdiction within the limits of this territory, but within the walls of the city Chinese officials may exercise such authority as is not inconsistent with the defense of the territory. The British government may also erect fortifications and carry out other defensive works in a defined region lying outside of the leased territory. Chinese war-vessels retain the right to use the waters. Wei-hai-wei is not to be fortified, but is intended to be a naval base, place of exercise, and sanatorium for the British squadron on the China station.

Weidner, wīd'nēr, *Revere Franklin*, American Lutheran theologian: b. Centre Valley, Pa., 22 Nov. 1851. He was graduated from Muhlenberg College, Allentown, Pa., in 1869, from the Lutheran Theological Seminary, Philadelphia, in 1873, and after being ordained to the ministry was pastor at Phillipsburg, N. J., 1873-8, and at Philadelphia 1878-82. He was professor of English, history, and logic at Muhlenberg in 1875-7, and in 1882-91 was professor of dogmatics and exegesis at Augustana Theological Seminary, Rock Island, Ill. In the last named year he accepted the presidency and the chair of dogmatic theology at the Chicago Lutheran Theological Seminary, both of which posts he still (1904) holds. He has published: 'Commentary on the Gospel of Mark' (1881); 'Biblical Theology of the Old Testament' (1886); 'Annotations on the General Epistles' (1897); 'Theologia; or the Doctrine of God' (1903); 'Studies in Exodus' (1903); etc.

Weigand, vī'gānt, *August*, Belgian musician: b. Belgium; d. Oswego, N. Y., 26 May 1904. He began his musical career as organist of Saint Giles' Church, Liège, and subsequently long presided at the organ of the Sydney, N. S. W., Town-Hall—the largest instrument in the world. His achievements as organist and composer won for him a professorship in the Royal Conservatoire at Liège. He came to the United States in 1903, gave numerous concerts, opened the large organ at Brown University, and was appointed to open the grand organ at the Louisiana Purchase Exposition, Saint Louis, in June 1904. In a dozen years he gave throughout Europe more than 1,800 concerts. He was the recipient of various distinctions, and was generally known as Chevalier Weigand.

WEEVIL.

1. Uninjured cotton bolls about to open.
2. Cotton boll practically destroyed by boll weevil.
3. Larva of boll weevil in square.
4. Side view adult boll weevil.
5. Adult boll weevil, wings spread.

WEIGHING MACHINES

Weighing Machines, mechanical devices for ascertaining the weight or mass of objects. It is to be understood, however, that the element thus determined is a relative value, and is entirely independent of the magnitude of the force of gravity or the tendency of a body to fall. For example, the force of gravity decreases with elevation, but a commercial unit of weight such as a "pound" is the same at the foot as it is at the top of a mountain. In the usual method of determining weights of this character, a "unit of mass" is first adopted, and then a "set of weights" procured, each of which represents a certain predetermined number of the mass units. With these, by the aid of a machine so constructed as to be capable of establishing an equilibrium between any number of the weights and the article being weighed, the ratio of the weight of the article to that of the adopted unit of mass is determined, and this ratio identified with the ratio of the masses. Such machines may be conveniently arranged in three general classes—"equal armed" balances, "unequal armed" balances, and "spring" balances.

Equal armed balances are represented by the various forms of "scale-beams," in which the scale-pans are below the beams, and the "counter-machines" in which the scale-pans are above the beam, both forms operating by establishing an equilibrium between a known and an unknown weight. Unequal armed balances are represented by those consisting of a single steelyard, and those formed by combinations of unequal armed levers and steelyards, such as platform scales and weighbridges, in which a small known weight at one end of a multiplying beam counterbalances a heavy unknown weight at the other end. Spring balances operate on the principle that, when an elastic body is subjected to a tension, the amount of elongation increases with the increase in the force of tension. In the simplest form, it consists of a spiral spring of hard steel of a high elastic limit. As commonly used it is suspended from a fixed point by a hook at its upper end, while its lower end is bent into a hook, which is crossed by another hook to which the article to be weighed is attached. An index attached to the spring and moving along the face of a graduated plate, indicates the amount of tension in terms of the adopted unit of weight. The contrivance is so arranged that the axis of the spiral is always a plumb line, under tension or at rest, and is capable of weighing only an amount within the elastic limit of the spring. Their capacity is generally small, and they are extensively used in butcher shops, and for other purposes where a high degree of accuracy such as may be obtained by lever balances is not required. On the other hand, the various forms of dynamometers employed for registering the pull of locomotives, are made with enormous capacities. In this connection the "torsion balance" may be conveniently mentioned, although in reality it is a machine generally used for the purpose of measuring horizontal forces, rather than weights as here understood. In its simplest form it consists of a beam, supported by a wire stretched horizontally which passes through its centre of gravity. When twisted by the application of a weight to the beam, the elasticity of the wire acts the part played by the weight of the beam in an ordinary balance. For measuring horizon-

tal deflections caused by electric, magnetic, and other forces, the wire is stretched vertically.

For all forms of weighing machines of the equal armed type with small capacities, such as counter-scales, chemical and assay balances, etc., see **BALANCES AND SCALES**.

The majority of the machines of large capacity used for weighing heavy loads such as carts loaded with grain, hay, coal, building materials, etc., operate on the principle of the lever, and belong to the class designated as unequal-armed balances. They are also known as "decimal balances," and as usually arranged, the ratio between the small known weight on the weighing beam and the unknown weight on the platform or bridge, is indicated in multiples of ten. Such a balance consists of a lever (*ab*), suspended at (*h*), and connected by the rod (*o*), with two levers (*r*) and (*s*), hinged at (*t*) and (*u*), respectively. A platform (*p*), resting by means of standards upon the levers (*r*) and (*s*), accommodates the load which is counterbalanced on the long arm of the weighing beam or lever (*ab*), by a sliding weight—(*w*). When a load is placed upon the platform (*p*),

Decimal Balance.

the levers (*r*) and (*s*), are depressed, and exert a downward pull on the short arm of the weighing beam through the rod (*o*), with a consequent lifting of the long arm. This pull is counterbalanced by sliding the weight (*w*) along the long arm until it is brought into a horizontal position. The weighing beam being graduated with an adopted unit of weight and fractions thereof (usually pounds), the weight of the load on the platform is ascertained by a simple direct reading of the graduated scale. In the smaller scales, the weight (*w*) equals one pound, and counterbalances a load of 100 pounds upon the platform, but it is evident, that by varying the number of levers, and the relative lengths of their arms, any desired ratio between the load and the counter weight may be readily obtained. In scales used for weighing loaded wagons and cars, the ratio varies from 1 to 500, or 1 to 1,000. Cattle scales are capable of weighing from 10 to 200 head of cattle at a single operation, and the capacity of grain scales ranges upward of 500 bushels, while the large iron and steel manufacturing plants and gun shops, employ machines with capacities exceeding 100,000 pounds. The machine at Watervliet Arsenal, Troy, N. Y., used for weighing guns, has a capacity of 300,000 pounds.

Continuous weighing machines are employed to weigh automatically, material carried by conveyors, picking bands, etc., without interfering with the travel of the bands, and without requir-

ing the tipping of the material, such as grain, sugar, coal, etc., into a weighing hopper and back again, with the attendant amount of breakage or loss, and the annoyance of dust. The principle upon which they operate is applicable to tramways.

Weight Thermometer. See THERMOMETER.

Weights and Measures. The science of measuring and weighing holds an important place in the factors of civilization. There is scarcely an art more universal or more vitally important. Weights and measures are fundamental necessities of commerce, industry, and science. Measurement is required in the exploration of lands and waterways, in their location and transfer, in the work of construction of buildings, bridges, railroads, and other engineering works, in the manufacture of foods, in the preparation of compounds, and in the purchase, shaping and sale of materials. Weights and measures are essential to all barter of goods. Here, the accuracy may range from the "heap" or "pile" of ancient times to the one one-hundredth of a cent used in cotton and spelter quotations "on change," estimates of value which we call prices being based on a specified weight of gold. Weights and measures are essential in all construction whether the precision be the "rule of thumb," or the millionth of an inch in optical work, or the one ten thousandth of an inch in the manufacture of fine machinery. The pharmacist with his weights compounds the prescriptions which mean health and life to the sick. In the extractive and compounding industries, weights and measures are used to determine the essential proportions in analyses and compounds, and precision is the main condition of reproducibility of results. Likewise the manufacturer must accurately weigh, measure, and test his materials to secure perfect construction. Surveying and navigation would be very primitive were it not for the rigorous measurements of base lines, accurate triangulation, precise leveling, including even such delicate measurements as the variation of latitude. Weights and measurements will in fact be found necessary in the discovery and in the statement of industrial and scientific facts of all kinds. The birth of the exact sciences was coincident with the development and application of quantitative measurements to the phenomena of nature, and the rapid growth of modern science has since been parallel with that of precision. James Watt was one of the earliest to suggest international standards which would enable scientific results when published in terms of such standards to be intelligible and reproducible the world over. Precise and uniform standards made possible the interchangeability of parts in machinery, first practically applied by Eli Whitney and to-day one of the most important principles in manufacturing.

Classification.—Weights and measures ordinarily include length, area, volume, capacity, and weight (or mass). These are relatively the most important kinds of measures used by

man. However, within the last half century when such products as power, electric current, heat, light, refrigeration, and services of other kinds have entered the world's markets as commodities for manufacture, purchase, and sale,—the scope of weights and measures has widened to include units used in the measurement of velocity, pressure, energy, electricity, temperature, and illumination. Technical requirements also resulted in a series of compound units such as the knot, a unit of speed for vessels of one minute of the earth's circumference per hour; the ton-mile used in transportation rates and statistics; the foot-pound, a unit of energy; the dyne, the international unit of force, and other units of the centimetre-gram-second system of scientific units in use throughout the world. Such compound units are multiplying apace with the technical needs, and have proven of inestimable value and economy by the facility and precision which they afford in conveying exact quantitative results of experiment and observation. With advancing needs the units of weight and measure have extended to microscopic and to telescopic dimensions. The millimicron of the physicist and the still smaller Angstrom unit of which it requires 254,000,500 to make one inch, are used in spectrum analysis for measuring the dimensions of light waves, while on the other hand the "earth's orbit" is used by astronomers in measuring stellar distances. In addition, the "light-year" is used for the greatest distances, this unit being the distance which light traverses in one year, or about 6,000,000,000,000 miles. With the extension and division in size of units, the kinds of instruments and methods of application of the units themselves have multiplied. Almost every occupation has its particular units, its methods of measurements, and its special measuring instruments. A few of the thousands of the latter may be cited, such as the common rulers, carpenter's folding rules, draughtman's scales, surveyor's chains, engineer's tapes and level rods, lumberman's log rules and board measures, the merchant's yard stick, the tailor's tape, the shoe, glove, and hat-measures, machinist's scales, measuring bars, micrometers, micrometer calipers, limit gauges of ring and plug types, end and line standards of precision. In measuring volume we have the standard capacity measures, milk measures, beer measures, wooden dry measures, a vast variety of standard flasks, glass graduates such as burettes, pipettes, and other volumetric apparatus of the druggist, physicist and chemist, the gauging rods for casks and cargoes, gasometers reading in cubic feet, tanks and reservoirs with graduated scales reading volumes directly. For weighing, we have even balance scales, steelyards, platform scales, spring balances, all ranging from the most delicate analytical balances to the master scales for weighing canal boats and railway trains. Scales are especially designed for every particular need, and the countless varieties attest the high state of the art of weighing and its great importance in industrial and scientific work. Such instruments have multiplied in form and number, and the demand for them has grown so rapidly that the manufacture of weights, measures, and measuring instruments forms in itself a whole group of industries.

With the development of units of measure of the order of inter-molecular distances on the

WEIGHTS AND MEASURES

one hand and of almost interstellar distances on the other, and the multiplication of kinds of instruments used in measurement has come the invention of a large variety of measuring appliances which automatically indicate the result upon a scale. Of this class are thermometers, spring balances, aneroid barometers, pressure gauges, speedometers, and indicating meters of all kinds. Computing scales not only indicate the weight but show the computed total price of the article at each possible price per pound. Many of this class of instruments also make continuous record of the measurements showing by a curve the values at successive moments of time. Of this type are the automatic recording instruments used to record temperature, air pressure, sunshine, rainfall, electrical quantities as well as tide recorders, anemometers and many others. Equally interesting are those measuring instruments like dividing engines, trip scales, or trip measures which besides measuring definite lengths, weights or quantities automatically perform certain operations such as graduating a scale, delivering or tipping a certain weight of grain, or delivering certain volumes of liquids. Closely related are those devices which integrate quantities delivered or magnitudes measured, such as the small map wheels which measure distances on maps, or the planimeters which measure areas within irregular contours, and all forms of gas and water meters, integrating rain gauges, integrating watt meters for measuring electric power consumed. These instruments usually indicate on a dial the total number of units measured since the last zero setting.

Metrology.—Many sciences and industries have given the science of metrology their best thought and labors. Chemistry opened up new chapters in the science of the refractory metals, developing iridium and platinum of purity requisite for the world's fundamental standards of mass and length, producing in conjunction with metallurgy the remarkable "invar" nickel-steel alloy having practically a zero temperature coefficient of expansion, the alloy manganin free from temperature coefficient for electrical resistance, the Jena glass, a material for measuring flasks and thermometer bulbs which practically eliminates temperature disturbances. To optics and the glass industry we are indebted for the microscopes, telescopes, polariscopes, and other optical instruments which form essential parts of modern measuring apparatus. Optical methods based upon the interference of light waves have made possible the detection of changes of dimension far beyond the power of the microscope to detect. By such methods plane glass surfaces are produced having errors of less than a millionth of an inch, and in the interferometer is provided the most delicate and sensitive length-measuring instrument known to man. Metallurgy and engineering have developed methods of fusing, casting, and tempering materials to be used in measuring apparatus, and have developed the accurate machining of such instruments. Astronomy has given the precision measurements of time, the "second" being the unit of time in the international C. G. S. system of units. Mathematics has devoted a large section of its science to the theory of observations and added rigor in their adjustment, and in the elimination of accidental errors, and by developing the theoretical side of precision measure-

ments has rendered the greatest service to metrology.

Unit Standards.—The standards of length and mass are fundamental. From there and the unit of time practically all other standards are derived, either directly or indirectly. The derived standards include those used in the measurement of volume, density, capacity, velocity, pressure, energy, electricity, temperature, illumination, and the like. The production of copies, multiples, and subdivisions of the fundamental standards, the construction of the derived standards, and the comparison of the standards used in scientific work, manufacturing and commerce with the fundamental or derived standards of the government are functions of the Bureau of Standards in the United States and of similar bureaus in other countries. In the United States the standard of the weights and measures of trade is maintained through the State, county, and city scales of weights and measures with an efficiency dependent upon local administration. For more precise purposes, however, uniformity and precision are attained and maintained only by regular reference of the local standards to the fundamental standards of the government, at the Bureau of Standards in Washington.

The units of weight and measure in the United States are practically those used in the colonies prior to the formation of our government. While Congress has never definitely authorized the weights and measures in common use, it has sanctioned their use by its act of 14 June 1836, providing that accurate copies of the yard, pound, etc., be furnished as standards to each State of the Union. The constitutional power "to fix the standard of weights and measures," vested in Congress (I. 3, § 5, U. S. Constitution) has rarely been exercised, so that legislation on weights and measures has been confined to the individual States, and in this manner numerous differences in usage have grown up in the several States, although the same general system of weights and measures prevails throughout the country. The customary units of length are defined by reference to the yard. The yard itself was formerly defined as the length of a certain brass bar, the standard yard, kept at the Office of Standard Weights and Measures in Washington. Since 1893 the yard is defined in terms of the international metre. The yard appears to have been a unit of length in England since very early times. The name signified in Old English and in Anglo-Saxon (gyrd) a rod or stick. A standard bronze yard of 1496 still exists in England, having been used for the verification of other yards until 1588, when a new standard was made which is also in existence to-day. This yard, known as the Winchester standard, was the legal standard in England until 1824, when new standards, the Imperial standards, were authorized.

When the Coast Survey was organized it was found necessary to have a definite standard of length, and an 82-inch bar was secured from the instrument maker, Troughton, of London. This bar was nearly a copy of Troughton's scale, and had not been compared with the British standard yard, but the distance between the 27th and 63d inch marks on the bar was taken as representing the standard yard, and was made the basis of the standards sent out

WEIGHTS AND MEASURES

In accordance with the act of Congress of 1836. In 1834 the British Imperial yard was destroyed by fire and when a new standard had been prepared, copies of it were made, two of which were presented to the United States in 1836. These copies were compared with the Troughton scale, and the latter was found to be 0.00083 inch longer than the new Imperial yard at the standard temperature of 62° F. One of the copies was then accepted as standard by the United States Office of Standard Weights and Measures in place of the Troughton scale. This copy of the Imperial yard was the standard on which all measurements of length in the United States were thereafter based until 1893, when the yard was defined in terms of the International prototype metre. The matter had been left entirely to the Treasury Department, which had adopted different yards from time to time, assumed to be equal to the British Imperial yard.

The copies of the Imperial yard had shown noticeable changes relative to the standard when subsequently compared, and this led to the belief that the Imperial yard itself was not constant. Shortly after the arrival of the National prototype metre, a careful determination of the relation of the Imperial yard to the International metre at the Office of Standard Weights and Measures showed that the relation differed from that legalized in 1866 by less than the uncertainty of the comparison, and it was decided to adopt the metre as the fundamental standard of length and to define the yard in terms of it. Not only is the constancy of the length of the Imperial yard suspected, but in addition the lines, which are about 1-1000 of an inch wide, are much too broad for present requirements. On the other hand, the International metre and its copies satisfy the rigorous requirements of modern metrology. The kilogram was also declared to be the fundamental standard of mass. The present standards of the United States are therefore independent of the British standards and in part differ from them. The prevalent idea that the weights and measures in common use are identical with the British Imperial system is therefore erroneous. The United States yard is slightly longer than the Imperial yard and this inequality extends to all of its subdivisions and multiples. The present material standards of the United States are the National prototype metre No. 27 and the National prototype kilogram No. 20, received by the President of the United States on 2 Jan. 1890. These are accurate copies of the International prototype metre and kilogram which are the fundamental standards of length and mass for the entire world. The latter standards are preserved at the International Bureau of Weights and Measures in accordance with the International Metric Convention of 1875, now signed by all the leading countries of the world, including England, Russia, and the United States. These countries jointly maintain and direct the work of this bureau through official representatives forming an international committee, composed of eminent scientific men from all parts of the world.

The units of length, and the derived units of area, volume, and capacity are derived from the International metre in the ratio of 1 metre = 39.37 inches (Law of 28 July 1866). Since 1893 the Office of Standard Weights and Measures and the Bureau of Standards which superseded

that office have used the equivalent 1 yard = 3600-3937 metre (by order approved 5 April 1893). This action fixed the values, inasmuch as the reference standards are as perfect and unalterable as human skill could make them. Besides the yard, the units of length most universally employed in the United States at the present time are the inch, foot, and mile.

The "inch" is the 1-36 part of the yard and like it has been in use since ancient times. The name (derived from the Latin *uncia*, meaning the twelfth part) occurs in Anglo-Saxon in the form of *ynce*. It probably originated only as a convenient subdivision for the foot. Lengths shorter than one inch are commonly expressed in fractions of an inch. Two methods of subdivision are in common use; among builders and wood workers it is customary to use the binary subdivisions, half, quarter, eighth, etc., but machinists also divide the inch into tenths, hundredths, and thousandths. The inch is usually denoted by the symbol " "; but botanists use the symbol ' for the inch. The "miner's inch" is a rather vague unit for the flow of water varying from 1.36 to 1.73 cubic feet per minute, and is the flow of water through each square inch of an orifice under varying heads of water. The "inch or gauge of cream" is fixed by Iowa statute as equal to $\frac{1}{4}$ gallon.

The "foot" is legally defined as $\frac{1}{36}$ of the yard or 12 inches. As its name implies it was probably based on the length of the human foot. Almost every nation, ancient and modern, has had a unit called the "foot," its value differing somewhat, as might be expected with a unit of so crude an origin. Most countries, however, have now adopted the metric system, the foot being discarded as an official measure, though still widely used in English countries. Lengths shorter than one foot are usually expressed in inches and fractions of an inch, but among surveyors and civil engineers it is quite common to use decimal fractions of the foot. The foot is generally denoted by the symbol ' , but botanists use the symbol ° to denote feet. Some artisans use the foot and the inch but not the yard, others the yard and its binary divisions, but not the foot or inch. Thus the foot and inch are used to the exclusion of the yard in building, while the yard and its binary subdivisions to the exclusion of the foot and inch in measuring cloth, and surveyors in surveying public lands use neither the yard, foot nor inch. (See *LINE*.)

The "statute" or "land mile" is the unit most commonly used for longer distances and is equal to 5,280 feet. The name is from the Latin *mille passuum*, 1,000 paces, the Roman pace being a double step and consequently about five feet in length. This mile was used by the Anglo-Saxons. Almost every European nation has had a unit called the "mile" but widely at variance with one another, ranging from about $\frac{1}{3}$ of the United States mile (Holland) up to seven United States miles (Norway). The British statute mile is slightly shorter than the United States mile. Since the introduction of the metric system, these old miles are being superseded by the kilometre, which is a fixed and definite unit the world over.

The following units of length are used in special work and are arranged in the order of their magnitude. Metric units are not included, although their use is steadily increasing. (See *METRIC SYSTEM*.)

WEIGHTS AND MEASURES

Mil (.001 inch) is used in electrical work, especially in indicating the cross section of wires.

The point (1-72 inch) is used in designating the sizes of type, the point system designating the sizes of type by the number of seventy-seconds of an inch height of the type face. The em is a unit of measure used in composition and varies with the size of the type, usually being considered as the square of the face height.

The line (1-12 inch) is little used, mechanics preferring to divide the inch into tenths, hundredths, and thousandths. It is used by printers and by botanists, the latter denoting the line by the symbol λ . The line "button measure" is 1-40 inch as defined in the tariff act.

The barleycorn ($\frac{1}{3}$ inch) is an old unit still surviving in shoemakers' shoe sizes, these being graded by thirds of an inch or barleycorns, in a system of thirteens.

Four units based upon the "hand" are sometimes used. These are the nail ($2\frac{1}{4}$ inches) for measuring cloth, originally the distance from the end of the thumb nail to the joint at the base of the thumb, and later fixed as 1-16 yard; the palm (3 inches) includes the breadth of the hand exclusive of the thumb; the hand (4 inches), originally the breadth of the palm, is used in measuring horses and is almost exactly one decimetre; the finger ($4\frac{1}{2}$ inches) is about the length of the middle finger and is only used as a rough unit in cloth measure. This should not be confused with the finger breadth used in measuring charges of powder.

The surveyor's link (7.92 inches) is the length of one link or 1-100 part of a surveyor's chain, and is used in the survey of lands.

Quarter (9 inches) is sometimes used in measuring cloth (more frequently in Great Britain) to designate a quarter of a yard. A unit of the same length called the span was originally half a cubit, but probably has not been used in modern times as an officially recognized unit.

The engineers' link (12 inches) used as a unit in engineering is the hundredth part of the engineers' chain, and is decimally divided. The tenth of the engineers' link is 1.2 inches and is easily confused with the inch.

The pace is a conventional unit for measuring distances and is measured from the heel of one foot to that of the other, and a full pace measures about one yard. This is the value of the United States military pace, double time, with a cadence of 3 steps a second. The regulation military pace quick time is 30 inches with a cadence of 2 steps per second. The Roman pace was a double step of about 5 feet.

The ell, a unit still referred to but seldom used, having a value of 45 inches, varying, however, in different places.

The fathom (6 feet) is used in measuring depths of water or mines. The name comes from an Anglo-Saxon word *faethm*, signifying "embrace," and originally meant the length of rope between the two hands when the arms were held outstretched.

The rod, perch, or pole, is equal to $5\frac{1}{2}$ yards and is used in measuring land. It has varied in different places from 5 to 8 yards and is supposed to have been the length of the ancient goad used to measure the width of the first furrow.

The surveyors' or Gunter's chain (22 yards)

was so chosen that ten square chains might equal exactly one acre. This chain is the official unit prescribed for the use of surveyors surveying public lands under the supervision of the surveyor general.

The engineers' chain (100 feet) is used in engineering, and is decimally divided into feet, tenths, and hundredths of a foot. The use of the two chains in many cases for the same land for different purposes requires reduction tables. On account of the direct relation to the foot, the engineers' chain is becoming very widely used.

The bolt for measuring cloth is generally given as 40 yards, though the name means a roll of definite length simply. The customary length of the bolt varies with different fabrics and manufacturers.

The skein for yarn is often defined as 120 yards. Its length varies, however, according to the material and the locality. Consult International Yarn Tables, New York (1903).

The United States cable's length (720 feet), used by mariners, is 120 fathoms as recognized by the United States navy.

The furlong (220 yards) originally meant "length of a furrow," supposed to be the distance oxen could plow without stopping to rest.

The hank is a unit of length for yarn. In this country the length of a hank of cotton is usually 840 yards, while that of linen is 3,000 yards; different lengths, however, are also in use.

The nautical mile or geographical mile has been defined as 1-60 part of the length of a degree of a great circle of the earth. Since the earth is not a perfect sphere, however, the degree varies in length and this has led to much confusion in usage regarding the nautical mile. The definition accepted by the United States Coast and Geodetic Survey (consult Report of 1881, Appendix 12) is as follows: the 1-60 part of the length of a degree on the great circle of a sphere whose surface is equal to the surface of the earth. This makes the length of the nautical mile 6080.20 feet or 1853.248 metres. The uncertainty in the dimensions of the earth affects the last decimal place given. The nautical mile is often miscalled "knot." The latter term, however, is not a measure of length, but a measure of speed, equal to one nautical mile per hour. The admiralty "knot" of Great Britain is 6,080 feet.

The league is equal to three miles, the land league being equal to three United States statute miles (15,840 feet) and the United States marine league to three nautical miles (18,240.6 feet). Its value varies in different countries. The marine league is the distance from shore over which a country has jurisdiction under international law.

The degree is equal to about 60 nautical miles.

The astronomical unit equal to the mean radius of the earth's orbit or nearly 93,000,000 miles, is sometimes used in stating astronomical distances.

In stating interstellar distances it is sometimes found convenient by astronomers to use the light year, a still larger unit, being the distance traversed by light in one year, or 65,706 astronomical units.

Besides the measures of length given above,

WEIGHTS AND MEASURES

there are numerous very special methods of denoting length in case of special commodities. The thickness of sheet iron and steel is denoted by a system of arbitrary gauge numbers. The numbers in use differ for different products. On 3 March 1893 Congress passed an act establishing a standard gauge for sheet and plate iron and steel for use in the custom service. In this system the gauge numbers indicate thickness, or the weight per unit area. Sizes of wire are also denoted by a special system of arbitrary gauge numbers. The number of different systems which have been used is quite large. Pfeilschmidt's 'Wire and Sheet Gauges of the World' (1895) gives comparative tables for 11 systems of wire gauges. At present the most common gauges in use in this country are the Brown and Sharp gauge and the Birmingham wire gauge. The fineness or coarseness of yarn is denoted by a system of "numbers," which indicate usually the number of hanks of the yarn in question which will weigh one pound. Thus No. 10 yarn (English cotton yarn and spun silk count) is a yarn of such fineness that 10 hanks (of 84,000 yards) are required to make a weight of one pound, or again No. 1 wool (Aberdeen count) is such that one spindle (of 14,400 yards) shall weigh a pound. There are about 24 different systems of counts in use, and in order to introduce uniformity in counting textile yarn throughout the world, the international metric count was approved by the International Paris Conference of 1900. According to this count, No. 1 means that a length of 1 metre will weigh 1 gram, and 100 metres of No. 100 yarn will weigh 1 gram.

In addition to the above there are a large number of special systems of numbering particular commodities such as hats, shoes, gloves, nails, cordage, books, and other articles, too numerous for description. The growing use of the metric system is introducing uniformity and simplicity in commercial transactions and manufacturing as it has done in scientific work.

The units of superficial measure or area are usually the squares of the linear units and as such need but little comment. The circular mil (.7854 square mil) is the area of a circle .001 inch in diameter. One circular inch contains 1,000,000 circular mils, and one square inch contains 1,273,240 circular mils. The square inch is the most common small unit of area, being used in measuring pressures, strength, and other properties of materials, and in engraving, cloth analysis, and many other purposes. The square foot (144 square inches) is also largely used. It is the basis of the board foot which is 144 cubic inches of undressed lumber, being reckoned as one square foot of one inch board, or its equivalent. The "square" is a unit used in carpentry for flooring, ceiling, and shingling, and contains 100 square feet, architects' and builders' measure.

In surveyors' measure 1 acre = 10 chains = 160 square poles = 100,000 Gunter's or surveyors' links. The acre (43,560 square feet) was probably as much land as could be tilled in a day and therefore of rather indefinite extent until later times. It is a unit of the same order as the French *journal* and the German *Morgen*. The acres of various countries differ in size, for example, the Irish acre, Scotch acre, Cheshire acre, Cunningham acre, and the Imperial acre.

In subdividing public lands in the United States, the lands are laid out in townships. One township = 36 sections or square miles = 144 quarter sections = 23,040 acres. The "homestead" is a free grant of public land having a maximum area of one quarter section or 160 acres. In the Philippine Islands, the "homestead" is 64 hectares, which is almost identical with the homestead as defined above.

Among the more important units of volume are the cubic inch, the cubic foot, the cubic yard, and the cubic mile. The cubic inch is practically the smallest unit of volume based directly on linear units. It is very largely used. The cubic foot (1,728 cubic inches) is used in engineering to express volumes of gas, water, or other solids. In some States, such as Washington and Colorado, the cubic foot is established by statute as the legal unit for measuring the volume of water. A special system of units is used in the measurement of wood; 144 cubic inches or 1 foot square of one inch board equals one board foot. A timber foot, however, is 1,728 cubic inches or one cubic foot. A cord foot is a pile of wood 1 x 4 x 4 feet. A cord of wood is 3 cord feet. In the lumber business boards are usually bought and sold by the 1,000 board feet to simplify computation. In New Hampshire, a measure for lumber was adopted in 1866 based upon an "imaginary cubic foot" equal to about 1.4 cubic feet. This unit is also used in parts of Maine and Vermont. Round timber is measured as follows: "A stick of timber 16 inches in diameter and 12 inches in length shall constitute one cubic foot, and the same ratio shall apply to any other size and quantity. Each cubic foot shall constitute 10 feet of 1,000 board feet." In the practical use of this rule it is customary to consider 115 cubic feet equivalent to 1,000 board feet, instead of 100 cubic feet, according to the wording of the statute. In this case the diameter is taken at the middle of the log inside the bark. If the diameter is measured at the small end of the log, 106 cubic feet are allowed for 1,000 board feet. The New Hampshire rule is called the Blodgett Rule. The Doyle is the standard of log measurement in Arkansas for logs cut and sold or hauled. A large variety of log rules is in use throughout the country. These are locally accepted as standards, but they differ among themselves in so confusing a manner as to make it impossible to give an accurate and complete statement concerning them. The cubic yard is used largely in engineering and in computing grading, cuts, and fills, a cubic yard being equal to about one load.

The perch, in addition to being a unit of length and a unit of area, is also widely used as a unit of volume of brickwork and masonry. The perch of brickwork, however, is a widely varying unit, ranging from 16½ cubic feet to 25 cubic feet. In Colorado it is 16½ cubic feet, in Philadelphia 22 cubic feet, 25 cubic feet in North and South Dakota, 24½ cubic feet in other places. The latter perch is equal to a section of brickwork 1 x 1½ feet by 16½ feet or one perch in length.

A cord of masonry is usually reckoned at 100 cubic feet, although in some cases it is 96 cubic feet.

The cubic mile is used in expressing very large volumes, such as the silt carried by rivers.

Liquid Measure.—The fundamental unit of

WEIGHTS AND MEASURES

liquid measures in the United States is the wine gallon of 231 cubic inches—a unit abandoned by England in 1824, but now generally adopted by the various States of the Union. The British Imperial gallon measures slightly more than 277 cubic inches, and is the volume of 10 pounds of water under specified conditions. The liquid measures of the United States unfortunately bear no relation to those of England. Much confusion is occasioned by the use of the ambiguous term gallon, as there are in the United States the wine gallon (231 cubic inches), the ale, beer, or milk gallon (282 cubic inches), and the dry gallon, besides the "proof gallon," the unit for internal revenue taxation. The "proof gallon" is a wine gallon of spirits containing one half its volume of nearly pure alcohol at 60° F. and is the basis for computing the United States internal revenue tax. For example, a gallon of spirits containing 40 per cent alcohol would be 80 per cent proof and the number of proof gallons is computed by multiplying the per cent of proof by the number of wine gallons. Wisconsin and Connecticut still retain the dry gallon of 282 cubic inches as a legal standard. New Hampshire and Minnesota definitely retain the ale, beer, or milk gallon of 282 cubic inches, and Maine definitely mentions the same unit among its list of State standards. A recent Minnesota statute (1902) provides that the "Beer and milk measures shall contain the following capacities: The gallon shall contain 282 cubic inches. The half gallon shall contain 141 cubic inches, and the quart one half as much, and the pint one half as much as the quart." The milk gallon thus established is 51 cubic inches larger than the standard gallon used more generally throughout the country. There are thus three different quarts, the dry quart derived from the Winchester bushel, the liquid quart derived from the wine gallon, and the liquid quart derived from the beer or milk gallon. The differences, of course, extend proportionately to all the multiples and subdivisions of these units. The ordinary liquid measures are usually 1 gallon = 4 quarts = 8 pints = 32 gills. In addition to the capacity measurement by volume, the legal weight of a gallon of certain commodities have been fixed by statute in some States, and in several cases by Congress for certain purposes. Thus 12 pounds of strained honey is a legal gallon in Nebraska, 6½ pounds of kerosene (Kansas), and 7½ pounds of kerosene in Ohio, 11 pounds of sorghum molasses (Indiana), 8 pounds of castor oil (Kansas) are all legal gallons of the products named. These legal weights differ among themselves, and do not accord with the true volume of one gallon of 231 cubic inches.

The subdivisions of the gallon, the quart, pint, and gill are largely used in trade. In addition to the general liquid measures enumerated above, apothecaries have a special system of capacity measures based on the volume of the United States liquid pint of 28.875 cubic inches. One pint = 16 United States fluid ounces = 128 United States fluid drams = 7,680 United States minims.

The United States minim is the smallest of the units of volume and is about 0.000376 cubic inch. A minim of pure water weighs about 0.05 grain and corresponds to the "drop," which it approximates in size. The United States

minim is about 4 per cent larger than the British Imperial minim. It is denoted by the symbol *m*.

The drop varies from 0.02 to 0.1 cubic centimetre and is not a fixed unit, but is convenient for use in dispensing very small quantities of liquids. It is not subdivided and its size depends upon the liquid and the method of dropping. The ordinary form of drop pipette of the ophthalmologist delivers drops of about a half United States minim.

The United States fluid dram (60 minims) is equal to ⅙ United States fluid ounce, its volume differing from the volume of one avoirdupois dram of water, from the volume of one apothecaries' dram of water (by weight), and is about 4 per cent larger than the fluid dram in use in Great Britain. It is about 4 cubic centimetres, or an average teaspoonful, and is denoted by the symbol *f*.

The United States fluid ounce (480 United States minims) is the 1-16 part of the wine pint and has a volume of about 1.8 cubic inches. It differs from the British unit of the same name as well as from the volume of the avoirdupois ounce of water and the troy or apothecaries' ounce of water. Other measures of less definite character are often found convenient, such as the teaspoonful, dessertspoonful, tablespoonful, wineglassful, and teacupful. They do not contain exactly the quantities usually given arbitrarily, but more exactly the common spoonfuls contain the following quantities: A tablespoonful, 5 fluid drams or 20 cc.; a dessertspoonful, 2 fluid drams or 10 cc.; a teaspoonful, 60 minims or 5 cc.

Dry Measures.—The dry measures in general use in the United States bear no direct relation to the liquid measures of this country or Great Britain. The following are the ordinary units of dry measure: One bushel = 4 pecks = 32 dry quarts = 64 dry pints. The fundamental unit is the Winchester bushel, a unit abandoned by England in 1824, but still retained in general use in this country. The Winchester bushel has a volume of 2,150.42 cubic inches and is about 69 cubic inches or 3 per cent smaller than the Imperial bushel of Great Britain—a proportionate difference existing in the subdivisions of the bushel. Conflicting State laws render difficult an adequate statement of the status of the "bushel" in this country. Although the standard Winchester bushel contains 2,150.42 cubic inches, Nebraska has established 2,150 cubic inches as the volume of a legal bushel for that State, and other States have made similar changes. Several States adopted the old ale or milk gallon as the capacity of the dry gallon, this being about 5 per cent larger than the corresponding unit derived from the Winchester bushel. Moreover, special bushels have been legally established in many States for particular products, such as the charcoal bushel, which in Connecticut is 2,748 cubic inches, in Colorado 2,500 cubic inches, in Kansas 2,564 cubic inches, in Pennsylvania 2,571 cubic inches, and in Minnesota 2,419.5 cubic inches (or ½ basket). In Vermont "one bushel and three quarters of a peck" are "deemed a bushel of charcoal, lime, or ashes." In some places five pecks constitute a bushel of "screened lump coal." A lime bushel in Minnesota is 2,688 cubic inches. In Pennsylvania, however, it is equal to the Winchester bushel, although the coke bushel is 2,648 cubic

WEIGHTS AND MEASURES

inches. In the adjoining State of Ohio the bushel is 2,688 cubic inches. In Idaho, the bushel of fruit is defined as 2,564 cubic inches and in Missouri as 2,680 cubic inches. Some States require, furthermore, "heaped measure," others "struck measure," the heap sometimes being required to be "as high as the article will admit," and elsewhere "as high as may be without special effort or design," and in still other cases, as in Connecticut, the heaped bushel is definitely fixed as 2,564 cubic inches. The many objections to buying and selling agricultural products by volume, such as the difficulty of detecting error or fraud, the variation in the size of the heap, the ease of packing short quantity in a given volume, the effects of expansion, moisture, or shaking, and the general uncertainty of estimates of quantity based upon volume early led to the practice now quite general, of defining the bushels as definite weights for the different commodities. Unfortunately the matter was left to the several States with the result that the lack of uniformity in legislation and custom has introduced considerable confusion. Not only do the weights fail to equal the true volume of one Winchester bushel, but even for the same commodity and in adjoining States the values are widely at variance. In at least two cases the size of the bushel varies with the time of the year. For a few commodities like wheat and hard coal, the standard weight is fairly general—but for such commodities as fruits and vegetables there is but little uniformity. The values of the various bushels of apples vary by about 10 per cent and for beans and charcoal about the same proportion. The legal weights of the bushel of gooseberries or beets varies by about 20 per cent and for cranberries 17 per cent, for sweet potatoes and buckwheat the variation is about 28 per cent in range. The "bushel" has in fact become merely a name for a miscellaneous group of units varying from State to State and differing for the various commodities, sometimes, as in at least two cases changing with the time of the year. The uncertainty is confusing to trade and precludes the compilation of accurate statistics based upon so variable and ambiguous a term.

The barrel is a convenient receptacle for packing, transporting, and storing commodities. It varies in size, sometimes being defined in terms of units of volume, 6,253¼ cubic inches struck measure in Massachusetts. In other cases it is fixed as a definite number of units of dry measure, 100 dry quarts in New York, five bushels in Tennessee; or in some States as a definite number of liquid gallons, 36 gallons in Arkansas, 42 gallons in Tennessee, or more commonly 31½ gallons. Besides this method of definition the barrel, like the bushel and the gallon, is legally defined for certain commodities in terms of a definite number of pounds. The barrel of flour, for example, is commonly fixed at 196 pounds. Apart from this, but few States have used this method of defining the barrel and that only for a few products. Two hundred and eighty pounds of shelled corn constitute a legal barrel in Connecticut, 200 pounds of pork in Indiana, North Carolina, and Tennessee, 150 pounds of sweet potatoes in Massachusetts. In New York and some other States the several dimensions of the standard barrel are specified, although other forms con-

taining the same volume may be used. The dimensions specified in New York are head diameter 17½ inches, stave length 28½ inches, bulge not to exceed 64 inches outside measure. A barrel of crude oil is usually 31½ United States wine gallons and the barrel of refined oil 42 gallons.

The hoghead (two barrels), the pipe (four barrels), and the tun (eight barrels) are more commonly not intended as definite measures but merely convenient receptacles for liquids in bulk.

The smaller units of dry measure, such as the peck, dry quart, and dry pint, are largely used in retail trade, the pint and quart being used for smaller products like berries.

Avoirdupois System.—The avoirdupois system of weights is used for almost all commodities except the precious metals, chemicals, and jewels. The avoirdupois dram differs from the apothecaries' dram, and the avoirdupois ounce and pound differ from the troy units of the same name. Ambiguity is avoided only by properly qualifying the terms. The use of such unqualified terms as ounce, pound, or ton causes great confusion owing to the uncertainty and ambiguity of the terms. The "avoirdupois pound" or "troy ounce," however, are definite units. The avoirdupois units are as follows:

1 long ton = 20 long hundredweights = 80 long	
1 short ton = 20 short hundredweights = 80 short	
quarters = 2,240 pounds = 35,840 ounces = 173,440 grains	
quarters = 2,000 pounds = 32,000 ounces = 160,000 grains	
drams = 13,680,000 grains	
grams = 14,000,000 grains	

The fundamental unit of the avoirdupois system is the avoirdupois pound derived from the International kilogram, in accordance with the law of 1866 and the executive order of 1893, the value being 453.5924277 grams. The avoirdupois pound was probably derived from the Attic mina of 6845.3 grains Troy, the 1-60 part of the large Attic talent, divided by the Romans into 16 ounces of nearly the same weight as the modern ounce. Congress has never directly legalized any standard of weight except the Troy pound and that only for purposes of coinage. To avoid confusion in comparisons of mass, the ratio of the avoirdupois pound to the Troy pound was fixed at 7,000 to 5,760.

The United States avoirdupois dram (or drachm) is the 1-16 part of the avoirdupois ounce (28.3495 grams). This unit must not be confused with the apothecaries' dram (weight) which is the ¼ part of the apothecaries' ounce or 60 grains. The avoirdupois dram is largely used in the textile industries. The avoirdupois ounce is the 1-16 part of the pound and contains 16 drams. The avoirdupois stone is a denomination often used, especially in England, and varies with different commodity, the most common value being fixed in England as 14 pounds.

The hundredweight (cwt.) is the 1-20 part of the ton. The round hundredweight contains 100 pounds and is sometimes called the "cental," while the long hundredweight contains 112 pounds. This unit is used very largely in fixing transportation rates.

The commercial ton of 2,000 pounds is in very general use throughout the States, but 112 pounds is the legal hundredweight in many places, and 2,240 pounds the legal ton, as in

WEIGHTS AND MEASURES

England. The long ton is the national standard in this country. The gross ore ton contains 2,688 pounds. Great confusion at present exists in the use of the word "ton," as the unqualified term may mean the short ton, long ton, gross ore ton, miner's ton, varying from 2,500 to 3,000 pounds, displacement ton of 35 cubic feet, shipping ton of 40 cubic feet, timber ton of 42 cubic feet, or register ton of 100 cubic feet. The register ton varies in different countries. Accurate statistics covering more than a single State or industry are impossible to obtain, owing to the difference in the values of these units and methods of measurement. The tariff act defines the ton of coal as "28 bushels of 80 pounds each" equal to the long or United States ton, but the statutory ton of coal in Montana is defined as 26½ bushels of 76 pounds each. In some cases the ton is defined as a definite number of cubic feet, for example, 343 cubic feet is a legal ton of hay in North Dakota and Oklahoma, and in New Mexico the ton is defined as 380, 422, or 512 cubic feet, according to the time the hay has been stacked.

Troy Weights.—The Troy weights are as follows: One pound=12 ounces=240 pennyweights=5,760 grains. The Troy pound was legalized in 1828 as the standard unit to be used by the Mint of the United States in the regulation of the coinage. In view of the confusion in the weights and measures of trade, Congress found it important to legalize some particular weight for the use of the Mint, and by the act of 19 May 1828 legalized the copy of the Imperial Standard Troy pound. This copy was procured by Albert Gallatin in England in the preceding year and was received by President Adams 13 Oct. 1827. It was based upon the old Imperial Standard Troy pound of 1752, legalized in 1825. This Troy pound has not been recognized as a legal standard in England since 1855, and was declared illegal, with penalty attached, in 1878.

The grain is the 1-5760 part of the Troy pound, and is the only unit which connects the Troy system with the avoirdupois. A very old English statute (51 Henry III., 1266) provided that the English penny should weigh "thirty-two grains of wheat, well dried, and gathered out of the middle of the ear." Fifteen different values of the grain in different countries are cited, varying from 0.68 to 1.34 United States Troy grains. The Troy grain, as used in the United States, is 0.0648 gram. The diamond grain is 0.8 Troy grain. The Troy grain is practically obsolete in the avoirdupois measures. Fractions of the grain are usually indicated decimally.

The pennyweight is the 1-240 part of the Troy pound. Some 18 different values are recorded, varying from 7.42 grams to 24 United States grains.

The Troy ounce is the highest Troy denomination permitted in England, and is used in stating quantities of silver and other precious metals. In assaying the Troy ounce is frequently divided decimally. The silk Troy ounce according to Troemner is the 1-16 of the Troy pound and contains 360 grains. One hundred and seventy-five Troy ounces equals about 192 avoirdupois ounces.

The units of apothecaries' weights are as follows: One apothecaries' pound=12 ounces

=96 drams=288 scruples=5,760 grains. The apothecaries' pound is equivalent to the Troy pound in the United States, but in England the apothecaries' weights based on the Troy pound were discontinued in 1858 under authority of the medical act, and avoirdupois weights substituted in dispensing medicines. In the United States, the avoirdupois system is largely used in buying and selling drugs, although the metric system is rapidly coming into use and displacing the apothecaries' weights on account of its greater convenience. The apothecaries' grain is used in compounding prescriptions of the more powerful drugs. The United States apothecaries' scruple (20 grains) and the United States apothecaries' dram (60 grains) are still used in compounding prescriptions. The United States apothecaries' ounce (480 grains) is equal to the Troy ounce. The apothecaries' pound (equal to the Troy pound) is rarely used.

The units used in the weighing of diamonds are as follows: One diamond carat=4 diamond grains=64 parts. The carat is the jewellers' unit for weighing diamonds, the name referring to a small hard bean formerly used for that purpose. In view of the variation in the value of the carat in different countries, its weight was fixed by agreement of London, Paris, and Amsterdam jewelers, in 1878, at exactly 205 milligrams. The following varieties of carats should be carefully distinguished: The international diamond carat of 205 milligrams, a definite unit free from ambiguity; the English diamond carat (3.2 Troy grains or four diamond grains) differing, however, in different countries; the old carat (1-24 Troy ounce); the gold carat (about 150 Troy grains); and the gold carat, a ratio equal to 1-24 part by weight used in designating the purity of gold alloys.

WEIMAR—WEISHAUP

Weimar, vî'mâr. Germany, the capital of the grand duchy of Saxe-Weimar, on the Ilm, 13 miles east of Erfurt. It stands in a beautiful valley surrounded by hills, on ground partly elevated and partly flat. It is irregularly built except in the suburban portions. Its notable public edifices are the grand-ducal palace, a handsome structure erected partly under the superintendence of Goethe: the so-called Red and Yellow castles, now united and occupied by several public departments; the grand-ducal library (in the Green Castle), containing 200,000 volumes and a large collection of maps; the museum; the Stadtkirche, with an altar-piece, one of the finest works of Lucas Cranach, in which he has introduced portraits of himself and Luther and Melancthon; and the modern Gothic town-house. The public monuments comprise the Goethe-Schiller monument in bronze, statues of Herder, Wieland, the composer Hummel, the Grand-Duke Karl August, and various others, and a monumental fountain. Goethe's house is now used as a Goethe National Museum, and Schiller's contains relics of its former distinguished owner. A Goethe and Schiller Archives building was opened in 1896. Goethe and Schiller are interred in the grand-ducal vault in the new cemetery. Stretching away from the palace is a fine park on the banks of the Ilm. Weimar has a gymnasium, a real-gymnasium, academy of painting, school of drawing, normal school, and other educational institutions. It has neither trade nor manufactures of much consequence, the manufactures of iron, wood, straw, leather, and cloth being carried on to some extent, but as the capital of the duchy it is the seat of the legislature and of all the more important courts and public offices. It long ranked as a sort of "German Athens" in consequence of the enlightened patronage which the Duke Karl August (d. 1828) afforded to the four great literary men of Germany, Goethe, Schiller, Herder, and Wieland. Pop. about 30,000.

Weingartner, vin'gärt-nër, Felix, Austrian composer: b. Zara, Dalmatia, 2 June 1863. He studied at the Leipsic Conservatory, having received a government scholarship, and in 1884 his opera, 'Sakuntala,' was brought out at Weimar under the patronage of Liszt. He was musical conductor at Königsberg, Dantzic, and Hamburg in 1884-9, and in 1891 was appointed court conductor at Berlin. Ill health compelled the resignation of this post, and in 1898 he settled in Munich as conductor of the Kaim concerts. He has composed numerous songs, several symphonic poems, the operas: 'Malawika' (1886); 'Genesis' (1892); etc. He has written: 'Die Lehre von der Wiedergeburt und das Musikalische' (1895); and 'Beyreuth 1876 bis 1895' (1897).

Weir, wër, Harrison William, English artist and journalist: b. Lewes, Sussex, 5 May 1824; d. London 4 Jan. 1906. He learned the art of wood-engraving, but disliking it, turned to painting, and his first exhibition at the British Institution was in 1843. He was the last survivor of the original staff of the London 'News' and was engaged on the 'Graphic,' 'Pictorial Times,' 'Black and White,' and other London periodicals. He was an authority on the correct delineation of domesticated animals, was noted for his paintings

of country life, and as an illustrator of books and periodicals. He wrote and illustrated: 'The Poetry of Nature'; 'Every-day Life in the Country'; 'Our Cats and All About Them'; etc. Perhaps his greatest achievement was his work 'Our Poultry and All About Them' (1903), the writing and illustrating of which claimed his attention for more than 20 years.

Weir, James, American physician and author: b. Owensboro, Ky., 17 Oct. 1856; d. there, 9 Aug. 1906. He was graduated from the University of Louisville in 1878 and studied medicine there, and in New York. He published: 'Religion and Lust' (1897); 'The Dawn of Reason' (1898); 'Intelligence in the Lower Animals' (1898).

Weir, John Ferguson, American painter and sculptor, son of R. W. Weir (q.v.): b. West Point, N. Y., 28 Aug. 1841. He was a pupil of his father and became a member of the National Academy in 1866. Since 1869 he has been professor of painting in the Yale School of Fine Arts. As a sculptor he is known by his statues of President Woolsey and Prof. Silliman of Yale, and in addition to many portraits he has painted 'The Gun Foundry'; 'The Forging of the Shaft'; 'The Column of St. Mark's, Venice'; etc.

Weir, Julian Alden, American artist, son of R. W. Weir (q.v.): b. West Point, N. Y., 30 Aug. 1852. He studied with his father, and at Paris, with Gérôme, became a member of the Society of American Artists in 1877 and a National Academician in 1886. He has made a specialty of portraits and genre, his 'Idle Hours,' now in the Metropolitan Museum, New York, receiving the \$2,000 prize of the American Art Association, and his 'Breton Interior' obtaining a second class medal at the Paris Exposition of 1889. About 1887 he abandoned his former grave manner and has since been known as one of the Impressionist school.

Weir, Robert Walter, American artist: b. New Rochelle, N. Y., 18 June 1803; d. New York 1 May 1889. After studying under Jarvis he began portrait painting in 1821 and then studied in Florence under Benvenuti, 1821-3. In 1829 he became a National Academician and was professor of drawing at West Point 1837-79. He was of especial prominence as a historical painter, and among his works are the 'Embarkation of the Pilgrims' (1845) in the rotunda of the Capitol at Washington; the 'Church of the Holy Innocents' (1847), Corcoran Art Gallery, Washington; and 'Peace and War,' painted for the chapel at West Point.

Weir, a dam or dike across a river or stream to raise the level of the water for the purpose of diverting it to drive machinery, irrigate land, or to render the upper portion of the stream navigable, or for some other purpose. A weir is constructed of stone, or, as in the United States, of timber, crossing the river at right angles or obliquely. The term is also applied to an escape pipe for carrying off surplus water from a reservoir.

Weirs, Fishing. See POUND-NET FISHING.

Weishaupt, vis'howpt, Adam, German mystic: b. Ingolstadt 6 Feb. 1748; d. Gotha 18 Nov. 1830. He was the founder of the Society of the Illuminati (q.v.). Educated at Ingolstadt, he there became in 1772 extraor-

inary professor of law, and in 1775 professor of natural and canon law. His appointment to the latter post brought him into collision with the clergy, especially the Jesuits, as after the suppression of their order he became their bitter enemy, although he had been educated by them. He formed the plan of uniting a large number of men together to sustain certain perfectionist views, and his instruction-room soon became a nursery of his doctrines. In 1785 he was obliged to leave Ingolstadt, and retired to Gotha, where he was afterward made councillor of state by the duke. His most important writings are: 'Geschichte der Verfolgung der Illuminaten' (1786); 'Das verbesserte System der Illuminaten' (1787); 'Pythagoras, oder Betrachtung über die geheime Welt- und Regierungskunst' (1790); 'Materialien zur Beförderung der Welt- und Menschenkunde' (1850); 'Ueber Staatsausgaben' (1820); and 'Ueber das Besteuerungssystem' (1820).

Weismann, vis'män, August, German biologist: b. Frankfurt-on-the-Main 17 Jan. 1834. After studying medicine in Göttingen University he was clinical assistant at Rostock in 1856-7, and in the course of the three years 1858-60 visited Vienna, Italy, and Paris, devoting himself especially to studies in the natural sciences. He lived for a year at Schaumburg Castle as body physician to the Archduke Stephen of Austria, and in 1863 went to Gießen to prosecute his zoological studies under Leuckart. Having qualified as a lecturer in the University of Freiburg, he was appointed extraordinary professor there in 1866, and ordinary professor in 1873. His first published work was a treatise on the 'Development of the Diptera' (1864). It was followed by a work 'On the Influence of Isolation on the Formation of Species' (1872), and 'Studien zur Descendenztheorie' (1875-6). This work, translated into English, in 1882 by Prof. Meldola, under the title 'Studies in the Theory of Descent' (with a preface by Charles Darwin), treats of several important phenomena in natural history from the standpoint of a thorough believer in the doctrine of natural selection. His 'Beiträge zur Naturgeschichte der Daphnoiden' (1876-9) and 'Die Entstehung der Sexualzellen bei den Hydromedusen' (1883) are valuable contributions to the developmental aspect of zoology. A series of treatises followed, in which he developed his characteristic theories, among them being 'Ueber die Vererbung' ('On Heredity'), 'Ueber die Dauer des Lebens' ('On the Duration of Life'), 'Ueber Leben und Tod' ('On Life and Death'), 'Die Kontinuität des Keimplasmas als Grundlage einer Theorie der Vererbung' ('The Continuity of the Germ-Plasm as the Basis of a Theory of Heredity'), 'Die Bedeutung der sexuellen Fortpflanzung für die Selektionstheorie' ('The Significance of Sexual Reproduction for the Theory of Selection'), 'Ueber den Rückschritt in der Natur' ('On Retrograde Development in Nature'), and 'Amphimixis.' These have appeared in an English translation under the title 'Essays upon Heredity and Kindred Biological Problems' (Vol. I 1889; Vol. II. 1892). Weismann's other works include: 'Das Keimplasma' (1892), in English as 'Germ Plasm' (1893); 'Die Allmacht der Naturzüchtung' ('The Omnipotence of Natural Selection, 1893); 'Aeusserer Einflüsse als Entwick-

elungsreize' ('External Influences as Stimuli to Development,' 1894); 'Neue Gedanken zur Vererbungsfrage' ('Fresh Thoughts on the Question of Heredity,' 1895); and 'Ueber Germalselektion' ('On Germinal Selection,' 1896). See HEREDITY; WEISMANNISM.

Weismannism, the essential teaching of August Weismann (q.v.), sometimes referred to as "Neo-Darwinism." Interest and controversy have gathered mainly round his answer to the question, "How is it that a single cell of the body can contain within itself all the hereditary tendencies of the whole organism?" In all theories of heredity (q.v.) biologists have assumed that characters acquired by the individual are transmitted to offspring. Thus Weismann denies, and while biologists have concerned themselves with speculation as to the mode by which such transmissions are effected, he challenges them to prove that they are effected at all. The burden of proof is thus thrown upon his opponents, whose assumptions must give way to experimental evidence, which alone can determine, and that only after protracted record of cases, whether individually acquired characters are transmitted or not. Death, he contends, is not a primary attribute of living matter; the protozoans, or one-celled organisms, being immortal in so far that they do not die naturally. The protozoan, a microscopic jelly-like, apparently—not really—structureless mass, with no seeming unlikeness of parts, multiplies by division. Each half becomes a complete individual, and grows in like manner as the whole to which it belonged, till it also divides, and so on with the multiplication of protozoans *ad infinitum*. It cannot be said of either half that one is parent and the other offspring, for both are of the same age, and only, in a limited sense, as the subdivisions into separate individuals are repeated, can we speak of succession of generations. In these processes there is nothing analogous to death. "There are," Weismann says, "no grounds for the assumption that the two halves of an amoeba are differently constituted internally, so that, after a time, one of them will die while the other continues to live. Observations show that when division is almost complete the protoplasm of both parts begins to circulate, and for some time passes backward and forward between the two halves. A complete mingling of the whole substance of the animal, and a resulting identity in the constitution of each half, is thus brought about before the final separation." Consequently, there is unlimited persistence of the individual: potential, although not absolute, immortality so long as life lasts on the earth.

While the one-celled organisms are thus immortal, only the reproductive cells of the metazoans, the many-celled, are mortal. How has this come about? Weismann accounts for it by the failure of certain protozoans to divide equally, whereby unlikeness of parts and differences of position of parts resulted. "The first multicellular organisms were probably clusters of similar cells, but these units soon lost the original homogeneity. As the result of mere relative position there arose division of labor, some of the cells were especially fitted to provide for the nutrition of the colony, while others undertook the work of reproduction." Clearly, those on the outside, being exposed to

the direct and constant action of their surroundings, would be the media of nutrition, and the builders-up of the cell-commonwealth. So the result of this cell-clustering would be that the cells fell into two classes, body cells and germ-cells. While the body cells were solely concerned with the nutrition of the organism, losing in this specialization of function the power of reproduction, that power became concentrated in the germ-cells, or, speaking more precisely, in the germ-plasm, which is located in the nucleus of the germ-cell. It is these germ-cells which are the immortal part of the metazoans. With increasing subdivision of function there has been increasing modification of the organism, but the two-fold classification of the somatic or body cells and the germ-cells has remained. The death of the body cells is involved in the ultimate failure to repair waste, because a worn-out tissue cannot forever renew itself, and because cell-division has its limits. In brief, death is the penalty paid for complexity of structure. As it is impossible for the germ-cell to be, as it were, an extract of the whole body, and for all the cells of the body to despatch particles to the germ-cells whence these derive their power of heredity (the fundamental idea of Darwin's theory of pangenesis, q.v.), the germ-cells, so far as their essential and characteristic substance is concerned, are not derived from the body of the individual, but directly from the parent germ-cell. Heredity, Weismann contends, is secured by the transference from one generation to another of a substance with a definite chemical and molecular constitution—in other words, by the "continuity of the germ-plasm." This germ-plasm (which, Weismann's critics argue, runs perilously near a metaphysical concept) is assumed to possess a highly complex but extremely stable structure, so stable "that it absorbs nourishment and grows enormously without the least change in its complex molecular structure." Of this germ-plasm it is further assumed that a small portion contained in the parent egg-cell is not used up in the construction of the body of the offspring, but is reserved unchanged for the formation of the germ-cells of the following generations. Only variations of the germ-plasm itself are inherited, and it is upon these variations that natural selection operates. Variations are due not to the influence of external condition nor to use or disuse of organs, but to sexual conjugation. This process combines two groups of hereditary tendencies derived from the mingled germ-plasms of the male and female parents, resulting in those individual differences which form the material from which new species are produced by the action of natural selection. Those differences multiply in geometrical ratio.

The sum of the matter is that natural selection (q.v.) is the dominant factor, that use and disuse of parts and the action of the environment count for nothing, or, at the most, for but a little. (See *USE AND DISUSE*.) Here and there Weismann makes concessions as to the modifying influences of body cells on the germ-cells, and as to the ultimate origin of hereditary individual differences in the direct action of surroundings, which are a partial surrender of his main contention as to the isolation of the germ-plasm. It is not easy to reconcile the theory of an insulated germ-plasm with

the ceaseless manufacture, secretion, and expulsion of germ-cells, the materials of which are derived from the materials nourishing the entire organism, nor with the subtle influence of the nervous system on the reproductive organs.

Perhaps the most serious difficulty in Weismann's theory is in the reconciliation of psychological evolution with the continuity of the germ-plasm. For the researches of Spencer, Balfour, and others have demonstrated that the nervous system had its origin in modifications of the primitive skin due to the direct action of the environment. Be this as it may, the wide-reaching sociological significance of the doctrine of heredity—which may be regarded as the physical correlate of determinism—gives an importance to the labors of Weismann that cannot be overrated, and makes urgent the record of extended observations on the lines already laid down by Galton.

Weiss, John, American clergyman: b. Boston 28 June 1818; d. there 9 March 1879. He was graduated at Harvard in 1837, in the winter of 1842-3 studied at Heidelberg, Germany; was graduated in the last named year at the Harvard Divinity School, and settled as minister of a Unitarian church in Watertown, Mass. His anti-slavery utterances having disturbed the harmony of his pastorate, he resigned, and in 1847 became minister of a Unitarian society in New Bedford, Mass., but was soon compelled by reason of ill health to retire. Again in 1859-70 he was minister of the Watertown church, from which he finally withdrew in order to pursue his literary work. He was one of the most brilliant of the New England reformers and transcendentalists, and his writings display a mind at once mystical and scientific, strongly rationalistic on religious subjects, but endowed with a fine poetic power of interpretation, which he applied to religious history and symbolism, as well as to questions of philosophy and life, to which he brought prophetic insight and fervor. His publications include: 'Æsthetic Prose' (1845), a translation of Schiller's philosophical and æsthetic essays; 'Life and Correspondence of Theodore Parker' (1864); 'American Religion' (1871); 'Wit, Humor, and Shakespeare' (1880); and 'The Immortal Life' (1880).

Weissenfels, vis'sen-fels, Germany, a town of Prussia, in the province of Saxony, on the Saale, 20 miles south of Halle, with manufactures of sugar, machinery, paper, porcelain, shooes, woolen fabrics, gold and silver articles, etc. It has a 17th century castle, and a church containing the remains of Gustavus Adolphus. Pop. about 30,000.

WEITSPEKAN INDIANS—WELD

Weitspekan (wit'spĕk-an) Indians (from *Weitspek*, the name of one of their towns). A linguistic stock of North American Indians, comprising several small tribes collectively known as the Yurok, occupying the lower Klamath River in California from the mouth of the Trinity down. On the coast Weitspekan territory extends from Gold Bluff to about six miles above the mouth of the Klamath. The Chilula are an offshoot of the Weitspek, living to the south of them, on Redwood creek to a point about 20 miles inland, and from Gold Bluff to about midway between Little and Mad rivers.

Weitzel, vit'sĕl, Godfrey, American military engineer: b. Cincinnati, Ohio, 1 Nov. 1835; d. Philadelphia, Pa., 19 March 1884. He was graduated from West Point in 1855, became assistant professor of engineering there in 1859, was promoted lieutenant in 1860, and appointed chief of engineers in the Department of the Gulf. He was engaged in the defense of Fort Pickens, April-September 1861, later in that year was chief of engineers in the Department of the Ohio, and he accompanied Butler's expedition to New Orleans in that capacity. He became brigadier-general of volunteers in 1862, successfully conducted the Lafourche campaign, and defeated the Confederates at the battle of Labadieville. He was transferred to the Army of the James in April 1864, as chief engineer, and engaged in constructing defenses of Bermuda Hundred and Deep Bottom. He participated in the actions in Swift's Creek, Drewry's Bluff, and in the siege of Fort Harrison, and in November 1864 he was promoted major-general. He was second in command in Butler's unsuccessful expedition against Fort Fisher, and in March and April he was in command of the troops north of the Appomattox, with which he took possession of Richmond on 3 April. He was brevetted major-general in the regular army in 1865 and assigned to command the Rio Grande district, Texas. In 1866 he was mustered out of the volunteer service, appointed major in the regular army in that year, and was subsequently engaged in river and harbor improvements. He was advanced to be lieutenant-colonel of engineers in 1882.

Welbeck Abbey, England, the seat of the Duke of Portland, in Nottinghamshire, three miles south of Worksop. It occupies the site of an old Premonstratensian abbey, and came into the possession of the Portland family by marriage in 1734. It stands in a park 10 miles in circumference, and is a stately Palladian edifice of mainly the 17th and 18th centuries, but was greatly enlarged about 1864 by the fifth duke, to whom it owes its semi-underground picture gallery, ball room, and riding-school, the last 385 feet long, 104 feet wide, and 51 feet high.

Welch, Ashbel, American civil engineer: b. Nelson, N. Y., 4 Dec. 1809; d. Lambertville, N. J., 25 Sept. 1882. He was engaged as an engineer on the Lehigh Canal in 1827; was made chief engineer of the Delaware and Raritan Canal in 1835, and afterward planned the route and constructed the Belvidere and Delaware Railroad. In 1862 he became manager of the Pennsylvania railroad lines in New Jersey, and subsequently was made president. He introduced the block system (q.v.) in railroading in the United States, and published papers on

economics and civil engineering. He was elected president of the American Society of Civil Engineers in 1881.

Welch, Philip Henry, American humorist: b. Angelica, N. Y., 1 March 1849; d. Brooklyn, N. Y., 24 Feb. 1889. From 1882 to 1884 he was attached to the staff of the *Rochester Post Express*, and then removing to New York was employed by the *Sun*. He was prominent among the humorous press writers of his time and was an able satirist. He published 'The Tailor-Made Girl' (1888); and 'Said in Fun' (1889).

Welch, William Henry, American pathologist: b. Norfolk, Conn., 8 April 1850. He was graduated from Yale in 1870 and from the College of Physicians and Surgeons in New York in 1875. He studied pathology abroad, becoming in 1878 demonstrator of anatomy at the Bellevue Hospital Medical College, New York. Since 1884 he has been a professor of pathology at Johns Hopkins University. He is an eminent authority on bacteriology and pathology and is the author of 'General Pathology of Fever' and numerous professional papers.

Welcker, vĕl'kĕr, Friedrich Gottlieb, German archaeologist: b. Grünberg, Hesse, 4 Nov. 1784; d. Bonn, Rhenish Prussia, 17 Dec. 1868. He was educated at Gießen, and in 1806-9 was a tutor in the family of Wilhelm von Humboldt at Rome. In the last named year he accepted the chair of archaeology at Gießen and in 1816 became professor at Göttingen, a position he resigned in 1819 to accept the chair of archaeology at Bonn. Political troubles in 1832 caused his dismissal, but he was shortly afterward recalled and occupied the post until 1861 when he retired. As a classical scholar Welcker held high rank, his extensive writings on Greek art, history, and mythology are of great and lasting value, 'Die griechische Tragödie mit Rücksicht auf den epischen Cyclus geordnet' (3 vols., 1841) is perhaps his greatest work. He prepared editions of Alcman, Hipponax, Philostratus' 'Imagines,' Theognis, Hesiod's 'Theogony,' and 'Kleine Schriften' (6 vols.). Among the most notable of his other works are: 'Aechnische Trilogie' (1824); 'Der epische Cyclus' (1835-49); 'Alte Denkmäler' (1849-64); 'Griechische Götterlehre' (1863); etc. Consult: Kekulé, 'Das Leben Friedrich Gottlieb Welckers' (1880).

Weld, Theodore Dwight, American philanthropist and educator: b. Hampton, Conn., 23 Nov. 1803; d. Hyde Park, Mass., 3 Feb. 1895. He was the son of Ludovicus and Eliza (Clark) Weld, and of lineal descent from Jonathan Edwards. He entered Phillips-Andover Academy, but left school because of impaired sight. He was one of the 63 original founders of the American Anti-Slavery Society, and in 1833 was secretary of that society; and in 1830 he was agent of the Society to Promote Manual Labor in Schools. He entered Lane Theological Seminary, Cincinnati, Ohio, and taught colored youth evenings. He was conspicuous for unselfish charities and fair dealing, and did not hesitate to denounce slavery and the slave trade openly and publicly. He left the seminary when the trustees suppressed the local anti-slavery organization and began a course of lectures. He was repeatedly mobbed, but his commanding

presence and athletic attainments, as well as his fearless and wonderful eloquence, enforced respect; at Granville, Ohio, when advised that the church would be burned if he lectured as advertised, he informed the trustees that he would then speak from its foundations; to threatening letters he replied: "Come, but bring your own winding sheets, which I cannot supply"; six undisturbed lectures followed. At Painesville, Ohio, such was his eloquence that the leader of the mob kicked in the head of the bass drum with which he had thought to drown the speaker's voice. In 1836, his voice partially failed him, but he taught school and used his pen vigorously. In 1838 he married Angelina Emiline, daughter of Judge John Grinke, of South Carolina, who, having become a Quaker in 1835, emancipated her inherited slaves. He edited the American Anti-Slavery Society's publications in Washington, D. C., and was confidential adviser with Congressmen who favored abolition of slavery in the District. In 1854 he established a school at Englewood, N. J., for the joint education of white and black youth; in 1864 removed to Hyde Park, Mass., and aided in founding the Historical Society, the public library and the school system. He was one of the most intimate friends of the poet Whittier, and participated in the celebration of Whittier's 80th birthday, on which occasion Elizur Wright, a former secretary of the Anti-Slavery Society, and Arnold Buffum, who escorted Frederick Douglass to England, the only survivors of the famous 63 men of 1833, were present. In 1837 he published 'The Bible on Slavery' and 'Abolition of Slavery in the District of Columbia'; in 1839, 'American Slavery as It is from the Testimony of 1,000 Voices'; and in 1841, in London, 'Slavery and the Slave Trade in the United States.'

Of his eloquence, the late President Joseph F. Tuttle of Wabash College, Indiana, said: "He was the Thunderer of the West," and as late as 1863 Rev. S. J. May, of Syracuse, N. Y., wrote: "If Weld could only again take the platform, Wendell Phillips is his only possible rival in the cause of liberty."

The town of Hyde Park celebrated the centennial anniversary of Weld's birth in 1903, in their new library building in the Historical Society's apartment, which, in memoriam, bears the name "Weld Hall."

HENRY B. CARRINGTON,
Cor. Sec. Hyde Park Historical Society.

Welde, weld, Thomas, American Puritan clergyman: b. England about 1590; d. there 23 March 1662. Graduated from Cambridge in 1613, he took orders in the English Church and was minister at Terling, Essex, 1624-31. Being there deprived of his living on account of his Puritan views, he came to New England, arriving in Boston 5 June 1632, and in July was ordained as the first minister of the church at Roxbury, becoming a colleague of John Eliot (q.v.) in the following November. At the trial of Anne Hutchinson (1637) he was one of her opponents and with John Eliot and Richard Mather engaged in preparing the version of the Psalms, commonly known as the 'Bay Psalm Book,' the actual title of which was 'The Book of Psalms faithfully translated into English Metre' (Cambridge, 1640), the first book printed in New England. Weld was sent with Hugh

Peters to England in 1641 as colonial agent, a position he filled till his dismissal in 1646. He was afterward pastor at Gateshead, England (1649), and in 1662 was driven from his living on account of his nonconformity. He published 'A Short Account of the Rise, Reign and Ruin of the Antinomians, Familists, and Libertines that Infected the Churches of New England' (1644). This controversial tract was answered by John Wheelwright (q.v.) in his 'Mercurius Americanus' (1645).

Welding is the intimate union produced between the surfaces of two pieces of malleable metal, when heated almost to fusion and hammered together. This union is so close that when two bars of metal are properly welded the place of junction is as strong, relatively to its thickness, as any other part of the bar. Practically, iron is the only metal welded. To weld bar iron to another piece of iron requires an intense white heat. See also **ELECTRIC WELDING**.

Welding, Electric. The heat of an electric arc may be employed in fusing or welding metals, or the heat given out in the body of metal acting as a resistance to the passage of a heavy current, without any arc or spark, may effect that result. The arc method appears to have been first employed by De Meritens in 1881. In this instance leaden pieces designed to be united in the form of storage battery plates were arranged together as an extended positive electrode, and an arc was drawn between them and a negative carbon rod manipulated by means of an operating handle. Part of the heat energy of the arc served to melt the lead and cause union of the adjacent pieces, but much the larger proportion of the energy escaped by radiation and convection. The electric arc was thus akin to a gas blowpipe as commonly used in lead-burning in the construction of tanks for the chemical industries. Following De Meritens, heating by electric arcs has been applied to the fusing and welding of metals, notably of iron and steel, by Bernardos and Olszewski, Coffin, and others. When, as in the Bernardos and Olszewski method, the carbon electrode is made positive to the work, carbon is transported through the arc and is likely to enter the metal undergoing the process, which constitutes the negative pole. This addition of carbon may render iron or steel hard and unworkable, and cause cracks to be formed during the cooling of the fused mass at the joint or filling. By the employment, instead of carbon, of an electrode of the same metal as that of the work, Slaviennoff overcame this difficulty. The gradual melting of the metal electrode furnishes metal for forming joints, or for repairing or supplementing castings which are defective; such as those which are incomplete or contain blowholes. More recently the work is made the positive pole and this results in a greater proportion of the energy than formerly being expended in heating the metal undergoing the operation. Inasmuch as the conditions of energy supply for sustaining the arc, are but little different from those often found in the commercial operation of arc lamps from constant potential mains, arc welding may often be practised by connections made to such mains. A choking or steadying resistance is put in series with the fusing arc in a branch from direct current lines at a potential difference

WELDING

of 200 volts or thereabout. With work such as that to which the Bernardos and Olszewski method has been found to be applicable, the current in the arc may vary from 150 amperes up to 500 or more. The potential across the arc itself will generally be from 100 to 150 volts. With the metal electrode used by Slavienoff the current needed will be greater and the arc potential less than the above amounts. It appears that in certain cases the current may even surpass 4,000 amperes.

While a moderate application of these arc processes for fusing and welding iron and steel has been made, the range of operations to which they are suited is somewhat limited and their success depends largely upon the skill of the workman. He must protect not only his eyesight from the glare of the large arc, but also the surface of his body, and must avoid the irritating vapors which arise there from the flame. At the same time vigorous ventilation can not be employed, for motion of the air tends to disturb the arc and render the work more difficult. A large proportion of the energy is radiated or carried off in the hot gases from the arc. To these energy losses must be added that due to the use of the steady resistance for obtaining stability in the current of the arc. On the other hand the appliances needed for arc fusing or welding are simple and the source of current energy often conveniently found in existing electric circuits.

Werdermann, in 1874, proposed to deflect an electric arc formed between the usual carbons by a jet of air, forming thereby an electric blowpipe. More recently Zerener has in a similar way employed an arc deflected by a magnet as a sort of blowpipe for welding iron. In addition, the curious electric heating action first published by Hobo and Lagrange, has been proposed for welding metals. If a negative electrode of a direct current circuit having a potential of 100 to 150 volts, is of small surface relatively to that of the positive electrode when both are immersed in a liquid bath, such as a solution of potassium or sodium carbonate, the surface of such negative electrode, where immersed, glows with light, gas bubbles arise from it, and the electrode itself heats rapidly in spite of its immersion in cold liquid. A bar of iron used as the negative electrode, may thus be brought to incandescence and removed for welding, or it may even be melted under the liquid of the bath. The loss of heat in such a liquid heating process is necessarily somewhat great.

The Thomson process of electric welding, which differs radically from the arc heating operations above described, was first announced in 1886. It has since gone into extensive commercial use. No electric arc is employed, but the heat which effects the welding is solely due to the resistance of those parts of the metal pieces at the contact where they are to be welded together. This resistance is, of course, extremely low, and the delivery of sufficient energy for heating and welding is the result of the passage of relatively enormous currents. Their potential is only two or three volts, more or less. The metal pieces to be welded together are held respectively in massive clamps or vises of highly conducting metal such as copper, with a slight portion only of each piece projecting to form the joint. These projections of the pieces are brought together in firm contact, for which

purpose at least one of the clamps is made movable toward and from the other, both of them being mounted on a firm support. The pieces having been adjusted to meet in correct relation for the subsequent formation of the weld uniting them, an electric current sufficient in amount to heat the meeting portions of the pieces to the temperature at which they soften and unite, is passed from clamp to clamp, thus traversing the joint and the short projecting portions of the pieces between the clamps. So heavy is the current at command that a solid bar without break spanning the space between the clamps could be heated and melted. The completion of the weld after heating is effected by pressure exerted to force one clamp toward the other, which results in a slight upsetting or extrusion of metal at the weld called a burr. For copper a pressure of about 600 pounds per square inch of section is usual, while with iron it is 1,200 and with tool steel 1,800 pounds or more. Nearly all of the metals, even those like antimony and bismuth which are brittle and crystalline, may be united by this process, and many different metals and alloys joined one to another. In some cases, as with high carbon steels, a flux such as glass of borax, is employed to facilitate union at temperatures not high enough to burn or destroy the texture of the metal. Mild steel and iron welds are usually made, as in ordinary forges, at welding heat, or that which melts or fluxes the ordinary black oxide scale upon the metal. The heavy welding currents can not be conveyed without great loss to distances of even a few feet unless conductors of prohibitive section and cost be used. The welding clamps are in practice carried directly upon the secondary terminals of a special welding transformer. The Thomson welding transformer is a construction like a lighting transformer in which the usual secondary circuit of numerous turns is replaced by a very massive conductor constituting ordinarily only a single turn around the iron magnetic core. The primary or inducing circuit is similar to that of the ordinary transformer for alternating current and it is supplied from alternating current dynamos or lines as usual in such work. It will be seen that the secondary conductor is unique in character, being often a bar or casting of many square inches of section of copper of short length. The circuit of this single turn secondary is completed only by the meeting ends of the work pieces in the clamps. It will thus be evident that the chief resistance or opposition to the flow of the low voltage current in the single secondary turn will be at the proposed joint or weld between the clamps. Here it is then that the transformed energy is for the most part given out as heat, the section of metal which can be welded depending upon the scale of the apparatus used and the energy of the primary source which is available. The welding transformer has found convenient application in the heating of metal pieces for forging, bending, shaping, brazing or the like, in addition to welding. It has also in the Lemp process been divested of its welding clamps and applied to the local annealing of the hardened face of armor plates, so as to facilitate drilling and tapping, or cutting into desired shapes. The welds made by the Thomson process are usually butt welds, though lap welds are also made with almost equal facility. In butt welding there is of course an upset, burr, or

WELDON—WELDON AND SOUTH SIDE RAILROADS, RAID ON

extrusion of metal at the joint. In many cases this is not removed, and it renders the joint stronger than other adjacent sections. Oftentimes the joint is pressed or forged while still hot so as to remove the burr at the joint. In other cases the joint is finished by filing or grinding. The welding clamps are modified in form and disposition to suit the shape and size of the pieces to be held, and the pressure used to effect the weld is either manually applied by levers or is obtained from a strained spring, or again, in large work, by hydraulic means under control by suitable valves. The heating effects of the electric current are so perfectly adjusted by regulating appliances that most of the metals formerly regarded as unweldable, yield good results with the process. Even leaden pieces, such for example, as sections of lead pipe, may be joined together with great ease. The operation of the electric welder is characterized by uniformity, rapidity, flexibility, cleanliness, neatness, accuracy and economy. It has found extensive application to repetition work; single machines making sometimes as many as 2,000 welds per day of ten hours. It is used widely in the wagon and carriage industry for tires, axles, bands, fifth wheels, etc., and for wire bands for affixing rubber tires to wheels. Many parts of bicycles and automobiles are built up by electric welding. In the construction of tools and parts of machinery and particularly in the wire industry it plays an important part. Another important field is in the welding of wire or strip into hoops or bands for barrels, tubs, pails, etc. Machines are in operation producing electrically welded wire fencing, in which the wires which in the fence are horizontal are welded to verticals at intervals, the action somewhat resembling that of a loom. In joining pipe into continuous lengths or coils, and also in welding *in situ* street railway rails into a continuous track the electric weld possesses a special adaptability. An interesting application of the electric welder is found in the production of steel tubing by the progressive welding of a longitudinal seam. A long strip of flat sheet or *skelp* is rolled up so as to cause the lateral edges to meet. It then passes between welding rolls whereby the heating current locally traverses the meeting edges and welds them. The operation is progressive from one end of the pipe to the other as it is fed through the machine. The result is a pipe of uniform diameter with walls of even thickness, having a delicate bead along one side where the weld has been made. This bead is removed if the pipe be subsequently mandrel drawn with a reduction of its diameter. In the earlier electric welders the operations of clamping the pieces in place, applying and cutting off the electric current and exerting mechanical pressure, were usually manually controlled. Machines more or less automatic are now frequently employed. In recent types adapted for rapid repetition of work upon identical pieces, the action is entirely automatic; the machine runs continuously and its sequence of actions is definitely determined by its construction. These machines are power driven, movements being imparted for clamping the pieces as they are fed to the machine, for closing the current switch, for exerting pressure to complete the weld, for cutting off the current and for releasing the pieces from the clamps after the operation. In wire fence

and chain machines the stock is itself fed automatically and the welding continued until the machine is stopped or the material exhausted. The energy required to effect electric welds naturally varies with the size of the pieces and with the material. It also depends upon the time consumed in the work, which time may be made shorter or longer even with exactly similar pieces. The following table gives the results of some tests made upon different sections of iron, mild steel, brass and copper in the form of bars. The figures are only approximate and would vary considerably if the welds had been made in times different from those given. In general, working at a greater rapidity would lessen the total power used but require larger apparatus for the increased output required during the welding:

ENERGY USED IN ELECTRIC WELDING BY THE THOMSON PROCESS.

ELIHU THOMSON,
Electrical Expert and Inventor.

Weldon, N. C., a town in Halifax County, on the Roanoke River and the Seaboard Air Line and Atlantic Coast Line railways, 97 miles east of Raleigh. It is at the head of steamboat navigation on the Roanoke. Here are located six churches, a state bank, a winery, several mills, and a weekly newspaper. There is excellent water-power. The surrounding region is an agricultural one. Pop. (1890) 1,286; (1900) 1,433; (1910) 1,999.

Weldon and South Side Railroads, Wilson's Raid on. The first movement in the siege of Petersburg, June 1864, was to sever its railroad communication with the south and for this purpose Gen. Meade ordered Gen. J. H. Wilson to lead an expedition to destroy the roads, after which he was authorized to cross into North Carolina and make his way to the coast or to join Gen. Sherman in northern Georgia. When Wilson suggested a possibility that he might have to return northward, he was assured that the enemy's cavalry would be fully employed by Sheridan and that it was the intention for the Army of the Potomac immedi-

WELL--WELLAND CANAL

ately to cover the Weldon and South Side railroads, so that no infantry could be sent from Petersburg to bar his return. Wilson, at 3 o'clock on the morning of 22 June, moved from Mount Sinia church on the Blackwater to destroy the Petersburg and Lynchburg, and Richmond and Danville railroads, his objective point being Burkesville, the intersection of these roads. He had two brigades of his own division, and Gen. Kautz's division of four regiments, in all about 5,500 men with 16 guns. He crossed the Weldon Railroad at Reams' Station, destroying the station and some of the road, reached the Lynchburg road, near Ford's Station, about 14 miles from Petersburg, and destroyed it as far south as Burkesville, a distance of 30 miles, and then turned to and moved along the Danville road, destroying it to Staunton River, about 30 miles. The Confederate cavalry division of Gen. W. H. F. Lee had followed him closely, and near Nottoway Court House succeeded in interposing between his two divisions. At Staunton River Kautz found the bridge guarded by about 600 militia with artillery intrenched, which he attacked without success. At the same time W. H. F. Lee attacked Wilson's rear, and the latter, now nearly 100 miles from Petersburg, and having accomplished the object of his expedition and unable to go farther, determined to return. Marching at midnight, he moved eastward 80 miles, through Christianburg and Greensboro, crossing the Meherrin River, at Safford's bridge, and arriving at the Double Bridges of the Nottoway in the afternoon of the 26th. He was then ten miles west of Jarratt's Station of the Weldon Railroad. Ascertaining that but 1,000 Confederate cavalry and infantry held Stony Creek Depot, on the Weldon Railroad, ten miles northeast, he moved rapidly to cross the railroad two miles south of that point. Gen. Lee had been kept well informed of Wilson's movements and, to intercept his return, had sent Gen. Hampton, with his cavalry division, on the 27th to Stony Creek Depot, where he arrived at noon of the 28th. Fitzhugh Lee's division following as far as Reams' Station, ten miles north of Stony Creek and about the same distance south of Petersburg. When Wilson arrived at the crossing of the Stony Creek Depot and the Dinwiddie Court House roads, he was attacked by Hampton's outpost, the contest continuing until 7 p.m. Wilson now endeavored to evade Hampton by marching westward to the old stage road to Petersburg, thence entirely around him to reach the left of the Army of the Potomac. Kautz led the advance, but before Wilson could withdraw all of his own division, early in the morning of the 29th, he was attacked in flank and front by Hampton and driven back on the road to the Double Bridges, and his command much scattered. Hampton following two miles, then turning back to intercept him should he attempt to cross the Weldon Railroad at or near Reams' Station; but Wilson's main body had passed the stage road before Hampton reached it, who only struck Wilson's rear. Wilson reached Reams' Station at 9 a.m., where he found Kautz, who had preceded him two hours, and engaged Fitzhugh Lee's cavalry and some of Gen. Mahone's infantry intrenched. Wilson had expected to find the Weldon road held by the Army of the Potomac; and now, finding himself so nearly surrounded, he issued all his ammunition, de-

stroyed his wagons and caissons, and at noon began to move back by the Boynton road and Double Bridges to the south side of the Nottoway, intending, after crossing the river, to move eastward about 20 miles and then turn north again. But Fitzhugh Lee had moved his division past his left and two brigades of infantry, under Gen. Mahone, sent down the railroad from near Petersburg, attacked Wilson in front, Fitzhugh Lee attacked him in flank and rear, Kautz was cut off, and Wilson's whole rear was thrown into confusion. Kautz escaped, crossed the railroad near Reams' Station, and got within the lines of the Army of the Potomac, abandoning his artillery, and having 1,000 of Wilson's men with him, 500 of his own remaining with Wilson. At Stony Creek Wilson's rear was again attacked and thrown into some disorder; but pushing on, he crossed the Nottoway before midnight, and then moved eastward to Jarratt's Station, where he halted until daylight of the 30th, when he continued eastward, crossed the Nottoway again at Peter's bridge, rested five hours, and at 6.30 p.m. resumed the march for Blunt's bridge over the Blackwater. The bridge had been in great part destroyed, and the river was not fordable. A hard hour's work repaired the bridge, which was crossed and destroyed, just as Hampton and Fitzhugh Lee came up. The Confederates here ceased pursuit, and Wilson arrived at Light House Point, in the afternoon of 2 July. He had been gone ten days, had marched over 330 miles, and had destroyed more than 60 miles of railroad. His loss in both divisions was 240 killed and wounded, and 1,261 captured or missing; 12 field-guns and 4 mountain howitzers were abandoned; and all his wagons were burned or captured. Consult: 'Official Records,' Vol. XL; Humphreys, 'The Virginia Campaign of 1864-5.'

E. A. CARMAN.

Well, a natural flowing spring; excavations for water, which are among the most ancient permanent human constructions. The wells of the Sahara are square holes cut in the sand, beneath which, in most places, lies a continuous sheet of water at convenient distances for digging. The Greek and Roman wells were provided with a curb, long before well sweeps or pulleys were invented, as the deeply worn grooves in the curbs of ancient wells prove.

Welland Canal, Ontario, Canada, a ship canal extending from Port Colborne to Port Dalhousie, across the neck of land west of the Niagara River and Falls, and maintaining continuous navigation between Lake Erie and Lake Ontario. It traverses Welland County, and near Welland, the capital [pop. (1901) 1,863], the Welland or Chippewa River forms part of its course. The canal is 26½ miles long, 14 feet deep, and surmounts a rise of 362¾ feet by 25 locks. It was begun in 1824 and was opened to travel in 1833. It was enlarged in 1871, and again in 1900, the total amount expended on its construction to 30 June 1900 amounting to \$24,233,587. The canal is open to navigation on an average about 240 days in the year; an average of 2,200 vessels, transporting 700,000 tons of freight, pass through annually; and the annual collection of tolls on freight, passenger, and vessels averages about \$225,000. See CANALS.

WELLDON—WELLESLEY COLLEGE

Well'don, James Edward Cowell, English prelate and educator: b. Tonbridge, Kent, 25 April 1854. He was educated at Cambridge, was head master of Dulwich College 1883, and of Harrow School, 1885-98. In the last named year he was appointed to the bishopric of Calcutta and as such was metropolitan of India. He resigned in 1902 and returned to England, where he was made canon of Westminster. Besides standard translations of Aristotle's 'Politics,' 'Rhetoric,' and 'Nicomachean Ethics,' he has published: 'Sermons Preached to Harrow Boys' (1887); 'The Spiritual Life and Other Sermons' (1888); 'The Hope of Immortality' (1898); 'The Revelation of the Holy Spirit' (1902).

Welle-Makwa, wél'k-mák'wá, Central Africa, the most important affluent of the Ubangi (q.v.), a tributary of the Kongo. Its source is on the western slope of Mount Emin Pasha, and after a course of about 400 miles through a fertile and rich country to the north and east of the Kongo, it flows into the Ubangi at Dayu, opposite Yakoma, at the confluence of two other headstreams. The identity of the Welle-Makwa, was uncertain for many years; explorers thought it was a different stream to the Ubangi, but their connection was fully established in 1888, and the river throughout its entire length is sometimes called the Welle-Makwa.

Weller, Reginald Heber, American Protestant Episcopal bishop: b. Jefferson City, Mo., 6 Nov. 1857. He studied at the University of the South 1875-7, and was graduated from the Nashotah Theological Seminary, Wisconsin, in 1884. Ordained to the priesthood in the last named year he was rector of Eau Claire, Wis., 1884-8; of Waukesha, Wis., 1888-90; and of Stevens Point, Wis., 1890-1900. He was consecrated bishop-coadjutor of Fond du Lac in November 1900, the somewhat spectacular ceremonial practised on this occasion calling forth more or less criticism.

Welles, wélz, Oideon, American statesman: b. Glastonbury, Conn., 1 July 1802; d. Hartford, Conn., 11 Feb. 1878. He studied at Norwich University, Vt., but did not complete the course there, and for a time turned his attention to the study of law. In 1826, however, he entered journalism as editor of the *Hartford Times*, which under his management became one of the leading Democratic papers of the State. He was one of the first publicly to advocate Andrew Jackson's election to the presidency, and always warmly supported him. In 1827-35 he was a member of the Connecticut legislature, and both as legislator and editor advocated the abolition of imprisonment for debt, opposed the practice of special legislation, and succeeded in obtaining the passage of general laws for the incorporation of business corporations. In 1836 he resigned the editorship of the *Times*, but continued to write for that paper. In 1835, 1842, and 1843 he was chosen State comptroller; in 1836-41 he was postmaster of Hartford; and in 1846 was appointed chief of the bureau of provisions and clothing in the Navy Department, which office he held till 1849. He had always been opposed to the extension of slave territory, and on the organization of the Republican party in 1855, became identified with it, and was Republican

candidate for governor of Connecticut in 1856; and a member of the national committee. In 1861 he was appointed secretary of the navy, and conducted the affairs of his department with marked executive ability throughout the Civil War; he continued in office under President Johnson till 1869. He was later affiliated with the Liberal Republicans, and in 1876 was a supporter of Tilden. He wrote 'Lincoln and Seward' (1874).

Wellesley, wélz'li, Arthur. See **WELLINGTON, ARTHUR WELLESLEY, DUKE OF**.

Wellesley, Richard Colley, Viscount and MARQUIS, British statesman: b. Dublin 20 June 1760, d. London 26 Sept. 1842. He was educated at Oxford and on his majority took his seat as Earl of Mornington in the Irish House of Peers. Three years after he was returned to the British House of Commons as member for Beccalston and afterward sat for Windsor (1787-96), and for Old Sarum (1796-7). He was appointed governor-general of India in 1797, and in 1799 created Marquis Wellesley in the Irish peerage. His administration, both for its ability and the large accessions of territory made under it by the conquest of Mysor and the humbling of the Marhattas, and in 1809 became foreign secretary under Mr. Perceval. In 1812 he resigned his place chiefly because he was in favor of Catholic emancipation, and did not return to office till 1821, when he became lord-lieutenant of Ireland. This post he retained till 1825, when he was removed from it by his brother, the Duke of Wellington, who was an opponent of emancipation and had become prime minister. In the Grey ministry he held the office of lord-steward till 1833, when he again became lord-lieutenant of Ireland. Displaced in the following year by the Peel ministry, he afterward held the office of lord-chamberlain for a few months of 1835. Consult. Martin, 'Indian Despatches, Minutes, and Correspondence of the Marquis Wellesley' (1836-7), and biographies by Torrens (1880), Malleison (1889), and Hutton (1893).

Wellesley, Mass., town in Norfolk County: on the Boston & Albany Railroad, 14 miles west of Boston. It was incorporated as a town in 1881, and includes the villages of Wellesley, Wellesley Hills, and Wellesley Farms. It is principally a residential town, with many broad streets and handsome residences. It is the seat of Wellesley College (q.v.), and also of Dana Hall, a secondary school for girls; Wellesley School, and Rock Ridge Hall, secondary schools for boys; and two Roman Catholic academies, the Academy of the Assumption for girls, and Saint Joseph's Academy for boys. There is also a public high school at Wellesley Hills, founded in 1865, and a public library of about 12,000 volumes (1904). The government is vested in the town-meeting and the selectmen, chosen annually. The water-works are owned and operated by the town. Pop. (1910) 5,413.

Wellesley College, a college for women located at Wellesley, Mass. It was founded by Henry F. Durant to give "to young women opportunities for education equivalent to those usually provided in colleges for young men." The charter was obtained in 1870, and the college first opened to students in 1875. It is non-sectarian in control; three representatives

WELLESLEY ISLANDS — WELLINGTON

of the alumnae serve on the board of trustees. In 1888-94 the system of elective courses was established which is still in force. The college confers one baccalaureate degree, A.B., and the graduate degree, A.M. Certain courses are required in mathematics, philosophy, physiology, Bible history, English, some foreign language, and natural sciences; in addition to the required studies every candidate for the degree must take a sufficient amount of elective work to complete the equivalent of 57 one-hour courses, a one-hour course being a course given once a week for one year; before 1905 the requirement was 59 one-hour courses. Of these electives 18 one-hour courses must be taken in one of the following ways: 9 in each of two subjects, related or unrelated; 9 in one subject with 9 divided between two tributary subjects; 12 in one subject with 6 in a tributary subject; 12 in one subject with 6 divided between two tributary subjects. Pedagogical courses are offered in the history and science of education and in methods of teaching; art and music are included in the curriculum; the courses in history and theory in both departments count toward the degree; studio work in art counts toward the degree after one course in history is completed; the regular practical work in music does not count toward a degree. A full course in music leading to the certificate of the department may be taken by candidates for the A.B. degree who remain at the college five years. The college contributes toward the support of the American School of Classical Studies in Athens, the American School of Classical Studies in Rome, the Marine Biological Laboratory at Wood's Holl, and the women's table at the Zoological Station at Naples. There are 44 scholarships for undergraduates and one graduate fellowship. The students maintain literary and dramatic societies and a number of the Greek letter societies. The campus has a particularly beautiful situation within the limits of the town; it includes a lake which affords excellent opportunity for rowing and skating; on this lake is held the annual "Float." The buildings include College Hall, the Farnsworth Art Building, the observatory, Houghton Memorial Chapel, and the residence halls or "cottages" for students. In 1903 an addition to the endowment of \$150,000 was raised to offset the gift from John D. Rockefeller of a central heating plant; the productive funds amount to \$836,342 (in 1904). The library contains 67,000 volumes, including the Gertrude Memorial Library, the Library of American Linguistics, and other special and departmental libraries. The students in 1910 numbered 1,375 and the faculty 125; about 42 per cent of the graduates have become teachers.

Wellesley Islands, Australia, in the Gulf of Carpentaria, are politically attached to Queensland. Mornington, the northernmost and largest island, is 40 miles long by 15 miles broad.

Wellhausen, vèl'how-zèn, Julius, German Orientalist and Biblical scholar: b. Hameln, Hanover, 17 May 1844. He studied theology in the University of Göttingen, in 1872 was appointed professor of theology in Greifswald University, but resigned in 1882 because he could no longer hold the accepted views of Scriptural inspiration. He went to Halle as extraordinary

professor of Oriental languages, and in 1885 was appointed to an ordinary professorship at Marburg, whence in 1892 he removed to Göttingen to occupy a similar post. In 1871 he published a text-critical work on the books of Samuel, and in 1874 appeared his treatise 'Die Pharisäer und die Sadducäer.' The first volume of a 'Geschichte Israels' was issued in 1878, and a second edition of it in 1883, under the title 'Prolegomena zur Geschichte Israels' (5th ed., 1899). The 'Prolegomena' was translated into English in 1885 by Black and Menzies, with a preface by W. Robertson Smith, the volume containing also a reprint of his article 'Israel' contributed to the 'Encyclopædia Britannica' (9th edition). The last-mentioned article was published separately in 1881 as a 'Sketch of the History of Israel and Judah' (3d ed., 1891), and included in a German form, as an 'Abriss der Geschichte Israels und Judas,' in the 1st volume of his 'Skizzen und Vorarbeiten' (1884-92). More recently the 'Abriss' has been amplified to form a work on 'Israelitische und Jüdische Geschichte' (1894; 4th ed. 1901). His masterly treatise on 'Die Composition des Hexateuchs und der historischen Bücher des Alten Testaments' (1885; 3d ed. 1899) originally appeared in the 'Jahrbücher für deutsche Theologie' (1876-7). Later works are: 'Muhammad in Medina' (1882); 'Der arabische Jospus' (1897); 'Reste arabischen Heidentums' (2d ed. 1897), first published in the 'Skizzen und Vorarbeiten'; 'Die Kleinen Propheten übersetzt, mit Noten' (1892; 3d ed. 1898); 'Das Evangelium Marci' (1903).

Wellington, James Clarke, American educator: b. Trenton, N. J., 14 July 1825; d. Hartford, Conn., 4 Sept. 1894. He was graduated from Princeton in 1844, was appointed associate principal in the New York Collegiate School in 1848, and in 1856-65 was literary editor of the Washington 'National Intelligencer.' He was clerk of the United States court of claims in 1862-7, in 1867-70 was president of Saint John's College, Annapolis, Md.; occupied the chair of belles-lettres at Princeton in 1870-1; and in 1871-94 was president of Columbian University, Washington, D. C. He was a regent of the Smithsonian Institution, president of the Corcoran Gallery of Art, and also of the Philosophical and the Anthropological Societies of Washington.

Wellington, Arthur Wellesley, DUXE OF, British soldier and statesman: b. 1769; d. Walmer Castle, England, 14 Sept. 1852. He was the fourth son of the 1st Earl of Mornington. His mother was the eldest daughter of the 1st Viscount Dungannon. He was educated at Eton, privately at Brussels, and finally at the Military College of Angers. On 7 March 1787 he received a commission as ensign in the 73d Foot. He was gazetted under the name of Wesley, the family name till changed by his brother to Wellesley. After a rapid series of changes and promotions he attained by purchase in September 1793 the command as lieutenant-colonel of the 33d Regiment, in which he had attained his majority in April of the same year. In 1790 he was returned to the Irish Parliament for the family borough of Trim, in the country of Meath. In May 1794 he sailed with his regiment for Flanders to join the army of the Duke of York. In 1796 he joined his regiment at the

WELLINGTON

Cape, arrived at Calcutta in February 1797, and was attached to the Bengal service. Later the 33d Regiment was attached to the Nizam's contingent in the Deccan with Wellesley in command. The army entered Mysore in March 1799. An engagement took place at Mallavelly on the 27th, in which Wellesley, who commanded the left wing, turned the right of the enemy. He was subsequently employed to dislodge the enemy from their posts in front of Seringapatam, and after the capture of that capital was appointed, July 1799, to its command. During his administration he was compelled to take up arms against Dhundiah Waugh, a robber chief, who styled himself "King of the Two Worlds." Wellesley overtook and routed him with a small body of cavalry to Sept. 1800. In April 1800 Wellesley attained the rank of major-general. Early in 1803 he was appointed to the command of a force destined to restore the Peshwa of the Mahrattas, driven from his capital by Holkar. This operation successfully performed, the other Mahratta chiefs, Scindia and the Raja of Berar, showed hostile designs against the British, and Wellesley was appointed to the chief military and political command in the operations against them. After an active campaign, in which he took Ahmednagar and Arungabad, he encountered a powerful Mahratta army, assisted by French officers, at Assaye (23 September) and entirely defeated it. The parallel successes of General Lake, and the defeat of the Raja of Berar by Wellesley at Argaum on 29 November, compelled the submission of the Mahrattas, and peace was restored on conditions drawn up by the successful general. The fame of Wellesley's achievements had now spread over India. Before leaving Madras he received his appointment as K.C.B. and the thanks of both houses of Parliament. He sailed for England on 10 March 1805 and arrived in September.

On 10 April 1806 Wellesley married Lady Catherine Pakenham, third daughter of the Earl of Longford. He had previously been elected and distinguished himself in the House of Commons by the defense of his brother's administration in India. In April 1807 he was appointed chief secretary for Ireland, and in August received the command of the reserve in the expedition to Copenhagen under Lord Cathcart and Admiral Kioke. He took Kioke 29 April, the only land operation of importance. On returning he resumed his duties as secretary, and received the thanks of Parliament for his share in the expedition. On 25 April 1808 he attained the rank of lieutenant-general.

In June Wellesley received the command of a force destined to operate in the north of Spain and Portugal in aid of the revolt against Napoleon. On 30 July he anchored in Mondego Bay, and landed his troops at Figueira. The English began their southward march on 8 August. Wellesley moved on the coast road to Torres Vedras. At Roliça he encountered about 5,000 men under Delaborde, whom Junot had sent in advance to arrest his progress. This corps, after a spirited resistance, was driven back and retired to Torres Vedras. Wellesley now drew nearer the coast, reaching Vimeiro on the 19th, where he was reinforced by two brigades from England, raising his force to 17,000. At the same time he was superseded in the command. The government had determined

to increase their army in the Peninsula, and had appointed Sir Hew Dalrymple to the chief command, with Sir Harry Burrard as second, and Wellesley, Moore, Hope, Paget, and Fraser as divisional commanders. Junot determined to attack the English on the land side while they were in the immediate neighborhood of the sea. The attack was made on 21 August, and Junot was beaten. After the battle Junot proposed an armistice, the result of which was the famous Convention of Cintra, by which the French agreed to evacuate Portugal on condition of being conveyed to France with their arms and baggage. Public feeling in England over the excessive liberality of the terms ran so high that the generals were recalled to be examined by a board of inquiry, but their conduct was approved of and commended. Wellesley proceeded to Ireland in December as chief secretary, and early in 1809 received the thanks of both houses of Parliament for his conduct of the campaign.

In the latter part of 1808 Napoleon overran Spain with 200,000 men, and Sir John Moore, pursued by Soult, carried the British army to Coruña, where it embarked for England. Lisbon was still held by Sir John Cradock, and a British force occupied Cadiz, when Wellesley was appointed to assume the chief command in the Peninsula. He arrived at Lisbon 22 April 1809. He advanced against Soult at Oporto, and the French were thrown into confusion and retreated precipitately. Soult now retired to Galicia, followed by Wellesley to the frontiers of Portugal, and harassed by the insurgent Portuguese. The Peninsula was at this time occupied by about 250,000 French troops; but after the departure of Napoleon the independence or insubordination of the French marshals prevented effective co-operation of the different armies, and the French command never extended beyond the districts occupied by their armies. The British commander had a series of difficulties to contend with. First was the smallness of the armies on which he could rely. The numbers of the British were always comparatively insignificant, and reinforcements were slowly and scantily supplied. Almost as formidable was the difficulty of co-operating with his allies. Spain and Portugal were without regular governments. The Portuguese officers even had mostly fled to Brazil, but the Portuguese troops, carefully drilled by Beresford and placed under the command of British officers, soon became a tractable and efficient force. It was far otherwise with the Spaniards. The junta and the generals were alike ignorant, incompetent, and self-conceited, and with the raw levies which constituted the Spanish armies it was positively dangerous to co-operate. Even with the Portuguese government Wellington had natural but formidable difficulties to contend with. The subsistence of the armies was a constant source of danger and embarrassment both in Spain and Portugal. The resources of the country were oppressed by the armies of three nations. The French took all they wanted and wasted much more. The Spanish armies, numerous and inefficient, were a sufficient weight for the junta, which always supplied with reluctance the wants of the British, who had commonly much greater difficulty in procuring provisions for money than either of the other armies had in seizing them.

WELLINGTON

Through all these difficulties Wellington adhered with undeviating patience and constancy to the strict principles of discipline he had laid down. He remonstrated with herculean labor, and with admirable spirit, as his despatches show, with authorities of all kinds; but he never under the great temptation took, or suffered others to take, violent means to supply his most pressing wants.

By a misunderstanding between Soult, who held the command in the north of Spain, and Ney, who was under him, Galicia was evacuated by both marshals, and never afterward recovered, a valuable result of Wellesley's first campaign. To co-operate with the Spanish armies, Wellesley had determined to advance into Spain, which he did in July by the north of the Tagus. Nearly every important fortress in Spain was in the hands of the French.

The victory of Talavera, 27-28 July, earned Wellesley the titles of Baron Douro and Viscount Wellington. Next day the French retreated across the Alberche, and broke up their army. The first invasion of Spain had resulted in nothing but a series of movements among the French troops. Wellington at this time surveyed the lines of Torres Vedras, and formed his plan of fortifications for their defense. Anticipating that invasion would come from the north, he left General Hill to guard the Tagus, and fixed his headquarters at Viseu.

The French in the meantime were largely reinforced. Soult was in Andalusia with 60,000 men threatening the south of Portugal, while in the north the army of Portugal was concentrating to the extent of 70,000 to 80,000, and the veteran Masséna was appointed to command it. Wellington was able to bring into the field from 50,000 to 60,000 British and Portuguese troops. The French invested the Spanish fortress of Ciudad Rodrigo early in June, and took it on 10 July. They then advanced to the Coa, from which the British retired. Almeida was captured on 27 August. Wellington fell back on the valley of the Mondego. In the middle of September Masséna began his march down the right bank of the river. At the Sierra de Busaco, a high ridge in front of Coimbra, Wellington made a stand and repulsed the French. After the battle Masséna turned Wellington's position, who retreated to Leiria, where he halted two days. On 8 October he entered his lines, just as the autumnal rains were beginning to fall. A powerful fleet and a flotilla of gunboats on the Tagus contributed to their defense. Masséna was wholly unprepared for his reception, and after some vain demonstrations he retired from their front. The Portuguese parties had cut off his communications with Spain, and sickness was rapidly diminishing his numbers. On 15 November he fell back to Santarém. Napoleon recommended to waste the English with continual engagements of advanced guards, and sent Soult instructions to co-operate with Masséna. But Soult, with the blockade of Cadiz and with the Spaniards on his hands, could only spare a sufficient force to besiege Badajoz. In March 1811 Masséna was compelled to begin his retreat, which he conducted with great skill. The French crossed the Agueda on 6 April. Wellington estimated their loss in the campaign at not less than 45,000. Wellington blockaded Almeida, and cantoning his army between the Coa and the Agueda, returned to Badajoz, which

had been taken by Soult and invested by Beresford. He was speedily recalled by an aggressive movement of Masséna to relieve Almeida. Wellington took up a position to cover the fortress at Fuentes de Onoro, where he was attacked by Masséna with a superior force. In this battle he performed the exceedingly critical operation of changing his front in presence of the enemy. The maneuver was successful, and Masséna was repulsed. Almeida surrendered a few days after the battle, and Masséna was about the same time superseded by Marmont. Soult in the meantime had been defeated by Beresford at Albuera in an attempt to relieve Badajoz. Wellington returned to prosecute the siege, and Marmont also moved south to join Soult, but afterward returned to Salamanca. This induced Wellington to push the siege of Ciudad Rodrigo in preference to that of Badajoz, and he returned to the Agueda. Marmont, however, advanced with a superior force, and he withdrew to the Coa. Marmont returned to Salamanca.

During the winter Wellington continued to occupy himself with preparations for this siege, collecting his stores at Almeida under pretext of repairing it. On 6 Jan. 1812, he moved his headquarters to Gallegos, invested Ciudad Rodrigo on the 8th, and took it by assault on the 12th. An earldom, a pension, and a Spanish dukedom rewarded this achievement. Wellington now went south with his principal force to take Badajoz, and Marmont, who had collected his forces to raise the siege of Ciudad Rodrigo, invaded Portugal by Sabugal, and ravaged the country. Badajoz was taken on 6 April, with a heavy loss. Having secured the frontier fortresses Wellington determined again to invade Spain. Leaving Hill on the southern frontier he moved north with his main army, and on 17 June reached Salamanca, Marmont retiring to Toro. The French general, when he had concentrated his forces, attempted by a series of pretentious maneuvers to surprise the British commander, his ultimate object being to cut him off from his communications. With this purpose he crossed the Tormes followed by Wellington, who took up his position between the river and two hills called the Arapiles. Here Marmont's overdisplay of tactics recoiled on himself. Having gained the outer Arapile, in extending his left to attack the British right he gave Wellington the opportunity he had long desired of attacking him. Marmont was wounded, and the French left and centre broken. Clausel, who attempted to re-form the army, was routed. Numerous prisoners were taken by the cavalry in pursuit, and the French retired to Burgos. Wellington reached Valladolid on 31 July, and turning on Joseph, who had advanced to support Marmont, followed him to Madrid, which he entered on 12 August. Hill was now advancing to join Wellington, and Joseph fell back from Toledo to Almansa in Murcia. These successes compelled Soult to abandon Andalusia, and an Anglo-Spanish force from Cadiz took Seville. Wellington's next movement was against the army he had defeated under Clausel, which had been largely reinforced. He left Hill in Madrid (1 September), and advanced to Burgos, being joined on his way by a body of Spaniards. The French retired, leaving a garrison in the castle, which Wellington deemed it necessary to take before advancing. The siege, for want of proper artillery, occupied him till 21 October. In the

WELLINGTON

meantime the northern army under Souham was again advancing, and Soult with a powerful army marching on Madrid, which Hill had abandoned to fall back on Salamanca. Wellington abandoned the siege and retreated, closely followed by the French, who repeatedly attacked his rear. At Palencia he was joined by a brigade from England. At Tudela Souham halted to wait for Soult, and Wellington proceeded to the Tormes, where he was joined by Hill, and when the French crossed the Tormes in force he took up his old position at the Arapiles. The united armies of Soult and Souham amounted to nearly 90,000 men. Wellington's strength was over 50,000. The enemy, instead of attacking, threatened his communications, upon which he retreated to the Agueda, and established his headquarters at Ciudad Rodrigo. The French, not being prepared to invade Portugal, withdrew their armies to cantonments in Castile. General Hill's corps continued to occupy Estremadura, and the rest of the British were cantoned on the Portuguese frontier.

The gains of this campaign were substantial. The French had not only been compelled to reinforce their Spanish armies largely at the expense of their operations elsewhere, but had lost Andalusia, and given the British a footing in Estremadura. Wellington received (18 August) the title of marquis, and Parliament voted him thanks and £100,000. The failure of the Russian campaign compelled Napoleon to recall Soult from Spain, and Wellington was able to open the campaign of 1813 with a force of 70,000 British and Portuguese. He had also been appointed commander-in-chief of the Spanish armies. He opened the campaign in May by an advance in the former direction, and on 12 June reached Burgos, the French retreating to the Ebro. Wellington turned their position by crossing the Ebro near its source, and after some unsuccessful fighting they fell back on Vittoria. In a strong position commanding the principal roads through the town they were defeated by the British on 21 June. Being driven from the town, while the British left had seized the Bayonne road, by which they retreated, they were thrown into confusion and routed. Wellington now occupied the passes of the Pyrenees, and besieged Pampeluna and San Sebastian. He was created field-marshal and received the Spanish title of Duke of Vittoria. Soult was despatched by Napoleon, with the title of lieutenant of the emperor, to restore matters in the Peninsula. He had still a powerful army (80,000), but after a series of engagements, called the battles of the Pyrenees, he retreated into France. Some time being spent in pushing the sieges of Pampeluna and San Sebastian, the former of which surrendered 31 August, the latter 31 October, Wellington crossed the Bidassoa in October, and in November the whole army descended from the Pyrenees into the French plains. Some severe fighting occurred before the armies went into winter cantonments. On 27 February Wellington defeated Soult at Orthez, and the French retreated to Toulouse. Suchet had abandoned Catalonia, and reached Narbonne. Another engagement took place in front of Toulouse on 20 April, in which the French after severe fighting were driven into the town. Next day Soult evacuated Toulouse, and Wellington entered it on the 12th. In the afternoon news arrived of Napoleon's abdication, but Soult declined to sub-

mit to the provisional government without further advice, and Wellington refused an armistice. Advances having arrived from Berthier, Soult entered into a convention on 18, and Suchet on 19 April. In a sortie of the garrison of Bayonne, before the peace was known, the British suffered severely. On 30 April Wellington, leaving his army in quarters, set out for Paris. In May he had to visit Madrid to allay political differences among the Spanish generals, and on 14 June he issued farewell orders to his army. He was created Marquis of Douro and Duke of Wellington in May, with an annuity of £13,000, commutable for £300,000, afterward £400,000. He received the thanks of both houses of Parliament. In July he went as ambassador to France, and he succeeded Lord Castlereagh as British representative in the Congress of Vienna. In April he took the command of the army assembled in the Netherlands to oppose Napoleon. (See FRANCE; NAPOLEON I.; WATERLOO.) On his return to England after the restoration of peace he received a vote of £200,000 for the purchase of the estate of Strathfieldsaye, to be held on presenting a colored flag at Windsor on 18 June each year. Numerous foreign honors were showered upon him; among others he was made field-marshal of the armies of France, Russia, Austria, and Prussia.

With the return of peace he resumed the career of politics. He accepted the post of master-general of the ordnance with a seat in the cabinet of Lord Liverpool in January 1819. In 1822 he represented Great Britain in the Congress of Vienna. In 1826 he was appointed high-constable of the Tower, and went to Saint Petersburg as ambassador on the affairs of Greece. On 22 Jan. 1827 he succeeded the Duke of York as commander-in-chief of the forces. On the accession of Canning to office (April 1828) he set the bad example of resigning this post on political grounds. He resumed it again on the accession of Lord Goderich. On 8 Jan. 1828 he accepted the premiership and, resigning the command of the forces, gave it to Lord Hill. During his first year of office he carried the repeal of the Test and Corporation Acts. In January 1829 he was appointed governor of Dover Castle and lord warden of the Cinque Ports. This year he carried the Catholic Emancipation Bill. Both this and the repeal of tests were reforms which he had steadfastly opposed, and which he yielded to necessity rather than conviction. He fought a duel in defense of his conduct on this bill with Lord Walsley on 21 March. In 1830 repeated motions for parliamentary reform were defeated, but the growing discontent throughout the country on this subject and a defeat in Parliament caused the resignation of the government in November. His opposition to reform made the duke so unpopular that he was assaulted by a mob on 18 June 1832, and his life endangered. He accepted the office of foreign secretary under Sir Robert Peel, 9 Dec. 1834, and retired with him, 8 April 1835. In the Peel ministry in 1841 he took a seat in the cabinet without office. On 10 Dec. 1842, on the death of Lord Hill, he resumed the command of the forces, which he held till his death. On the return of Peel to office in 1846 he supported him in carrying the repeal of the corn-laws, which up till then he had opposed. From this time his general policy in Parliament was to support the government of the day.

Wellington, Chile, an island off the west coast of Magallanes Territory, 138 miles long and 35 miles wide. Its northernmost extremity is Cape San Roman.

Wellington, Kan., city and county-seat of Sumner County; situated in the south central part of the State, near the southern boundary, on Slate Creek, and on the Atchison, T. & S. F., the Southern K., and the Chicago, R. I. & P. R.R.'s. It was first settled in 1871; and became a city of the third class in 1876, and a city of the second class in 1880. It is situated in an agricultural region and carries on an important export trade in grain and other agricultural products; it contains grain elevators, three flouring mills, plow works, and the shops of the Atchison, Topeka & Santa Fé Railroad. There are three banks with a combined capital of \$175,000. It is the seat of the Sumner County High School. The city government is vested in a mayor and a council of 10 members, half of whom are elected each year; the city owns the waterworks and the electric-light plant. Pop. (1910) 7,034. J. G. CAMPBELL, Editor of the 'Monitor-Press.'

Wellington, New Zealand, (1) The capital city of New Zealand, and also of the provincial district of Wellington, situated on Lambton Harbor, on the southwest of Port Nicholson, an inlet of Cook Strait, about 1,200 miles southeast of Sydney in Australia. Its fine harbor is the safest and most commodious in New Zealand. It receives most of the direct sea trade of New Zealand. The principal buildings and institutions are: Government House, a fine building in Italian style, said to be the largest wooden structure in the Southern Hemisphere; the houses of legislature, (the parliamentary library building was destroyed by fire to Dec. 1907); the government building; supreme court edifice; Anglican, Roman Catholic, Wesleyan, Primitive Methodist, Presbyterian, Congregational, and other churches; a free public library; Wellington College, a girls' high school, Saint Patrick's College (R. C.) a technical school, and other similar educational institutions; Victoria University College, affiliated to the University of New Zealand; a general hospital; a lunatic asylum; the Boys' Institute; and the botanical gardens. The city is lighted by electricity, and has a good water supply, and its streets are traversed by electric tramways. The chief industrial establishments are tanneries, candle and soap works, coffee-mills, boot factories, biscuit works, foundries, brick-works, saw-mills,

woolen-mills, breweries, and meat-preserving works. The town has a patent slip, and has been fortified. Unlike most New Zealand towns, this one is built of wood, owing to the volcanic nature of its site, where several earthquakes have already occurred. Its exports for 1908 were valued at £319,002; its imports, at £5,030,901. Pop. (est. 1909) 69,357, including suburbs. (2) A provincial district in the south of North Island, area about 11,000 square miles. Its coast is but little indented, the principal openings being Palliser Bay and Port Nicholson in the south. It is traversed throughout almost its whole length by a range of mountains, averaging about 4,000 feet in height. Parallel to this main range, and nearer the east coast, there is a series of lower ranges, and between these two chief mountain systems extends the broad Wairarapa Plain, merging northward into an undulating country. A considerable extent of fairly level country, increasing in breadth northward, is also found along the west coast. The district is well watered by several rivers and in the south are Lakes Wairarapa and Onoke. Wellington is well wooded, and timber is one of its chief exports. Much of the surface is admirably adapted for pastoral purposes, and there are now in the district over 4,000,000 sheep, in addition to large numbers of cattle and horses. Agriculture is also successfully carried on in several parts, the principal crops being oats, wheat, potatoes, and turnips. The number of cheese and butter factories is steadily increasing. Little mineral wealth has been found in the district of Wellington, but some gold has been worked. Exports for 1908 were valued at £2,924,727; imports, £5,300,329. The chief town is Wellington, the capital of the colony. Railways run from Wellington to Napier and New Plymouth.

Wellington, Ohio, village in Lorain County; on the Wheeling & L. E., and the Cleveland, C. C. & St. L. R.R.'s; about 35 miles southwest of Cleveland. It is the commercial centre of a farm and dairy section. It is noted for its large annual shipments of cheese. It has flour mills, lumber mills, a foundry, and in the vicinity are a number of butter and cheese factories. The two banks have a combined capital of \$75,000 and deposits amounting to \$520,000. Pop. (1910) 2,200.

Wellman, Walter, American journalist and explorer; b. Mentor, Ohio, 3 Nov. 1858. He obtained a secondary education in Michigan, in 1879, established the *Evening Post* of Cincinnati, and from 1884 was political and Washington correspondent of the *Chicago Herald* and *Record-Herald*. In 1892, after investigation of the subject, he located the landing place of Columbus in the New World on Watling Island (San Salvador) in the Bahamas, and built a monument on the spot as he had determined it. He led an expedition to the Arctic regions in 1894, reaching lat. 81°, northeast of Spitzbergen, and in 1898-9 a second expedition, reaching lat. 82° and discovering many islands. He wintered in Franz Josef Land and in the spring of 1899 made an unsuccessful dash for the pole. In May 1899 a party directed by E. B. Baldwin (q.v.), a member of the expedition, discovered Graham Bell Land.

Wells, Benjamin Willis, American journalist and author; b. Walpole, Cheshire County, N. H., 31 Jan. 1856. He was graduated from

WELLS

Harvard in 1877, studied also at Berlin, was a fellow of the Johns Hopkins University, in 1891-8 was professor of modern languages in the University of the South (Sewanee, Franklin County, Tenn.), and in 1898 became a member of the staff of 'The Churchman' (New York). His chief publications are 'Modern German Literature' (1895); 'Modern French Literature' (1897); and 'A Century of French Fiction' (1898), historical and critical studies. He also edited numerous German and French texts, contributed largely to periodicals, and edited (with W. P. Trent) 'Colonial Prose and Poetry' (1901), an anthology.

Wells, Carolyn, American humorous writer: b. Rahway, N. J. She took up literary work in 1895, and her many publications which are chiefly for juvenile readers, are: 'At the Sign of the Sphinx' (1896); 'The Story of Betty' (1899); 'Folly in Fairyland' (1901); 'Eight Girls and a Dog' (1902); 'The Pete and Polly Stories' (1902); etc.

Wells, Catherine Boott Gannett, American writer, daughter of E. S. Gannett (q.v.): b. England 1838. She was married in 1863 to S. Wells (d. 1903). She has been active in promoting educational advance and beside publishing Sunday School manuals has also published 'In the Clearings'; 'Miss Curtis,' a novel; 'About People,' a collection of essays; etc.

Wells, David Ames, American political economist: b. Springfield, Mass., 17 June 1828; d. Norwich, Conn., 5 Nov. 1898. He was graduated from Williams College in 1847, and from the Lawrence Scientific School in 1851, but before entering the latter institution had been assistant editor of the *Springfield Republican*, and was one of the promoters of the invention of a mechanism for folding books and newspapers in connection with the printing press. In 1851 he was appointed assistant professor at the Lawrence Scientific School, and was also lecturer on chemistry and physics at Groton Academy; during this earlier period of his life he published several text-books on the natural sciences. He first attained reputation as a political economist by an address on 'Our Burden and Our Strength,' read before a literary society of Troy in 1864; it discussed the resources of the United States in regard to the nation's debt-paying ability, and attracted the attention of the President, who summoned him to a conference in regard to the national finances. This resulted in the creation of a commission of three for the investigation of questions of taxation and revenue, of which commission Wells was chairman. In this capacity he was the first to collect economic and financial statistics for government use. In 1866 he was appointed to the office of special commissioner of revenue, was instrumental in abolishing the many petty taxes which had been imposed during the war, and originated most of the important forms and methods of internal revenue taxation adopted from 1866 to 1870. In the latter year the office which he held was abolished. He had at first been an advocate of the protectionist policy, but after a visit to Europe and a careful study of the English system, he changed his views, and advocated the system of free trade. In 1876 he was an unsuccessful candidate for Congress on the Democratic ticket. He published: 'Our Burden and Our Strength' (1864); 'The Creed

of the Free Trader' (1875); 'Why We Trade and How We Trade' (1878); 'The Silver Question, or the Dollar of the Fathers vs. the Dollar of the Sons' (1878); 'Our Merchant Marine; How it Rose, Increased, became Great, Declined, and Decayed' (1882); 'A Primer of Tariff Reform' (1884); 'Practical Economics' (1885); 'Relation of Tariff to Wages' (1888); 'Recent Economic Changes' (1898). His writings are notable for their clear and forcible presentation of a vast number of details and statistics.

Wells, Heber Manning, American politician: b. Salt Lake City 11 Aug. 1859. He was graduated from the University of Utah in 1875, and began early to take an active part in public life. He was recorder of Salt Lake City in 1888-90, and a member of the city board of public works in 1890 and in 1893. He was a member of the Constitutional Convention which framed the Constitution under which Utah was admitted as a State; in 1895 was elected governor of Utah for a five years' term on the Republican ticket, and in 1900 was re-elected for a four years' term. During the prolonged struggle between the mine owners and miners' unions in 1904, he maintained an impartial attitude as far as possible, but firmly opposed anarchy and disorder.

Wells, Herbert George, English author: b. Bromley, Kent, 21 Sept. 1866. He was educated at the Royal College of Science (South Kensington, London), published a 'Text-Book on Biology' (1892-3), and followed this by a series of works of fiction in which science and mechanics are employed for the accomplishment of various wonders narrated in the circumstantial and plausible manner of Verne. Among them are: 'The Time Machine' (1895); 'Select Conversations with an Uncle' (1895); 'The Wonderful Visit' (1895); 'The Island of Dr. Moreau' (1896); 'The Wheels of Chance' (1896); 'Thirty Strange Stories' (1897); 'The Invisible Man' (1897); 'The War of the Worlds' (1898); 'Tales of Space and Time' (1899); 'When the Sleeper Wakes' (1899); 'Love and Mr. Lewisham' (1900); 'Anticipations' (1901); 'The First Men in the Moon' (1901); 'Mankind in the Making' (1903); and 'Twelve Stories and a Dream' (1903). From 1894 to 1896 he was a member of the 'Saturday Review' staff.

Wells, Horace, American dentist: b. Hartford, Vt., 21 Jan. 1815; d. New York 24 Jan. 1848. He studied dentistry in Boston, and practised it there until 1836, then went to Hartford, Conn. For years he made investigations and experiments in search of an agent for preventing pain in the extraction of teeth, and finally became convinced that he had found such an agent in nitrous-oxide gas. In 1844 he made a practical test by having one of his own teeth extracted while he was under the influence of his supposed anæsthetic, and the operation confirmed his belief in the discovery. Thenceforth he used nitrous-oxide gas in his practice. He published 'A History of the Application of Nitrous Oxide Gas, Ether, and Other Vapors to Surgical Operations' (1847). His claims to the discovery of anæsthesia were controverted in the interest of G. Q. Colton, C. T. Jackson, W. T. G. Morton, and J. C. Warren (qq.v.), to each of whom some of the honors of its introduction

WELLS—WELLSVILLE

belong. Wells may have had a predecessor in C. W. Long (q.v.), but with regard to the first surgical use of an anæsthetic, all other names must yield priority to his. He became mentally unbalanced while advocating his claims in New York, was taken into custody, and committed suicide. A statue of Wells stands in Bushnell Park, Hartford, Conn. See **ANÆSTHETICS**.

Wells, Kate Gannett. See **WELLS, CATHERINE BOOTH GANNETT**.

Wells, Lemuel Henry, American Protestant Episcopal bishop: b. Yonkers, N. Y., 3 Dec. 1841. He was graduated from Hobart College in 1867, having during the Civil War served as a lieutenant in a Wisconsin regiment, and after being graduated from Berkeley Divinity School, Middletown, Conn., took priest's orders in the Episcopal Church in 1871. He was rector of Walla Walla, Wash., 1871-82; of Saint Louis, Tacoma, 1884-9; and of Trinity, Tacoma, 1889-92. In 1892 he was consecrated missionary bishop of Spokane.

Wells, Rolla, American capitalist and politician: b. Saint Louis, Mo., 1856. He entered business in the employ of a street railway company, and became assistant superintendent and finally general manager of the company. Giving up the latter position in 1883, he became prominently identified with a number of manufacturing and commercial corporations, and he is recognized as one of the leading business men of his native city. He has been active in local politics as a Democrat; was a delegate to the Democratic National Convention in 1896, and was elected mayor of Saint Louis in 1901 for a four years' term. Though nominated on the Democratic ticket, he received a large number of independent votes. His administration has been efficient and economical and he has taken an effective part in the preparation for the Saint Louis Exposition of 1904.

Wells, Webster, American mathematician: b. Boston, Mass., 4 Sept. 1851. He was graduated from the Massachusetts Institute of Technology in 1873, pursued special studies in civil engineering, and from 1873 was engaged in teaching at the Institute, attaining full professorship in 1893. He has written a series of mathematical text-books, among which are: 'Logarithms' (1878); 'Plane and Spherical Trigonometry' (1884); 'Higher Algebra' (1889); 'Complete Trigonometry' (1900); etc.

Wells College, a college for women, located in Aurora, N. Y. It was founded in 1868 by Henry Wells, who at that time deeded to the trustees the main building and 20 acres of land. It is undenominational in its control and policy. In 1888 the main building was destroyed by fire, but immediately rebuilt without crippling the work of the college. A preparatory course was at first maintained, but was abolished in 1896, when the range of elective system was also greatly increased. The college has now given up taking special students, as the regular applicants exceed the number that can be accommodated. Formerly the three degrees of A.B., B.L. and B.S. were conferred, but the A.B. degree is now granted for the completion of the course, which is largely elective, especially in the last two years. Biblical literature is among the required studies, courses in

the theory and history of music count toward the degree, but technical musical work does not. The discipline is by a system of student self government, based on a series of simple rules adopted and enforced by the students themselves. The college is situated on Cayuga Lake, and the College Boat Club has erected a boat house for the use of their members. The college buildings include the main hall, Morgan Hall, a dormitory (the former residence of the founder), a gymnasium, a science hall, and the administration building. The students in 1910 numbered 188, the faculty 28. Wells seeks to maintain its distinctive character as a small college, maintaining a high standard of college work, but not attempting university methods.

Wellboro, wélz'búr-ō, Pa., borough, county-seat of Tioga County; on the Fall Brook Railroad (N. Y. C. & H. R.); about 80 miles north of Williamsport. It is in an agricultural and coal mining region. It has wagon and carriage factories, marble works, lumber mills, tanneries, and machine shops. There are two banks, the combined capital of which is \$150,000. Pop. (1910) 3,183.

Wellsburg, W. Va., city, county-seat of Brooke County; on the Ohio River, and on the Pittsburg, Cincinnati, Chicago & Saint Louis Railroad; about 15 miles north of Wheeling. It is in an agricultural and sheep-raising region, and in the vicinity are numerous coal mines and natural gas. It has a fine city-hall, paper mills, glass factories, a sack factory, grist mill, and machine shop. There are three banks, having a combined capital of \$230,000. The place was founded in 1790. Pop. (1890) 2,235; (1900) 2,588; (1910) 2,680.

Wellston, wélz'tón, Ohio, city in Jackson County; on the Cincinnati H. & D., the Ohio S., and the Baltimore & O. S. W. R.R.'s; about 72 miles in direct line southeast of Columbus. It is in an agricultural and coal mining region, and has considerable iron manufacturing. In 1900 (government census) the city had 41 manufacturing establishments capitalized for \$855,606. The cost of the raw material used annually was \$505,415 and the value of the annual products was \$1,056,110. The chief industrial establishments are foundries, blast furnaces, barrel factory, machine shops, cement works, and brick works. The city has a high school, public graded schools, and a public library. There are two banks with a combined capital of \$85,000 and deposits amounting to about \$800,000. The city owns and operates the electric-light plant and the water-works. The government is vested in a mayor who holds office two years and a city council. The place was settled in 1871 and in 1876 was incorporated. Pop. (1890) 4,377; (1900) 8,045; (1910) 6,875.

Wellsville, N. Y., village in Allegany County; on the Genesee River, and on the Erie and the Buffalo & S. R.R.'s; about 25 miles southwest of Hornellsville. It is in an agricultural and dairy region, and in the vicinity are a number of oil wells. It has foundries, machine shops, creameries, flour mill, tanneries, and cigar factories. There are two national banks with a combined capital of \$150,000. It has a high school, graded elementary schools, and a public library. Pop. (1890) 3,435; (1900) 3,556; (1910) 4,382.

Wellsville, Ohio, city in Columbiana County; on the Ohio River, and on the Pennsylvania Railroad; about 85 miles southwest of Cleveland. It is in an agricultural and coal mining region, and in the vicinity are valuable deposits of fire clay. The chief manufacturing establishments are machine shops, foundries, iron and steel works, brick and tile works, potteries, nail factory, boiler works, and railroad shops. In 1900 (government census) there were 61 manufacturing establishments which were capitalized for \$1,233,863, and whose annual finished products brought \$1,548,190. There are three banks; the two national banks have a combined capital of \$150,000. There are nine churches, a high school, public and parish schools, and a public library. The city owns and operates the water-works. Pop. (1910) 7,769.

Welsbach (wēlz'bān) Light, an invention of Carl Auer von Welsbach, an Austrian, in 1884. In Europe it is known as the Auer light. It is based upon the discovery that certain materials become incandescent at a low temperature. The process followed is to saturate a combustible filament in the form of a network with a solution of a salt of a refractory earth, such as zirconium. It is then dried out and burned, the combustible element disappearing and leaving a frame of refractory material, which becomes incandescent at a low temperature. See RAILWAY TRAIN LIGHTING.

Welsh, Herbert, American reformer: b. Philadelphia, Pa., 4 Dec. 1851. He was graduated from the University of Pennsylvania in 1871; studied art in Philadelphia and in Paris with Bonnat; and practised as an artist in Philadelphia for several years. Visiting the Sioux reservation, impressed with the belief that the Indians required only a just and consistent treatment by the government and the extension of Christian missions to become civilized, he began a movement to secure to them their rights, which resulted in the organization of the Indian Rights Association in 1882. He became corresponding secretary of this association and has been active in its work, which has been instrumental in securing the passage of a bill providing for the individual ownership of land, and the application of the civil service law to the Indian service. He also took a leading part in the reform movement in Pennsylvania State politics in 1890; and in 1895 established a weekly periodical 'City and State,' published in the interests of good government. He has strongly opposed the tendency toward imperialism, and has severely criticised the government's policy and the evils attending the army's occupation of the Philippines. He has written 'Four Weeks among some of the Sioux Tribes'; 'Civilization among the Sioux Indians'; 'A Visit to the Navajo, Pueblo, and Hualapai Indians'; 'The Other Man's Country' (1900), dealing with the Philippine question.

Welsh, John, American merchant: b. Philadelphia 9 Nov. 1805; d. there 10 April 1886. He was educated in his native city, where he became prominent in business and was active in public affairs in many capacities, having large railroad and financial interests. He was a member of the Sinking Fund Commission, president of the Philadelphia Board of Trade, etc., and rendered efficient service in promoting relief

measures during the Civil War, especially in connection with the Philadelphia Sanitary Fair, in 1864, of which he was president, and which raised over \$1,000,000 for army hospital work. In 1873 he became president of the Board of Finance of the Centennial Exhibition, receiving from the citizens of Philadelphia, at its close, a gold medal, and the sum of \$50,000, with which he endowed the John Welsh chair of English literature in the University of Pennsylvania. In 1878 he went as minister to England, but in the following year resigned.

Welsh Calvinistic Methodists, a designation sometimes given to the Calvinistic Methodists, because Wales is the great seat of the sect. The Calvinistic Methodists are distinguished by their Calvinistic sentiments from the ordinary Wesleyans, who are Arminian. Whitfield is regarded as the father and founder of Calvinistic Methodism. Members of this sect have been active in recent years in seeking to bring about the disestablishment of the Anglican Church in Wales. See METHODISM.

Welsh Language and Literature. See CELTIC LANGUAGES.

Welwitschia, wēl-wich'ī-ā, a genus of plants of the order *Gnetaceae*, containing only one species, *W. mirabilis*. This species is confined to the deserts of Southwest Africa, where it was discovered in 1860 by Friedrich Welwitsch. It has a short and top-shaped stem which never grows much above the surface, but increases in thickness, until it may be three feet in diameter, and bears a pair of large opposite leaves. These leaves last throughout the whole lifetime of the plant, and become ultimately torn up longitudinally into long strips, which trail on the surface of the ground. Two cotyledons which are like short-lived leaves of much smaller size precede them. The flowers of the plant grow in cones like those of many conifers, the cones being arranged in panicles on the end of the stem between the two leaves. The female cones are much larger than the male ones, and in fruit are of a scarlet color.

Wen, an encysted tumor, moderate, but considerably varying in size, occurring in different parts of the body; commonly situated immediately under the skin, but most frequently on the scalp. The causes of their formation are unknown, but a strongly marked tendency to such swellings exists in particular individuals, leading to the belief in constitutional causes. At its commencement the wen is always exceedingly small and perfectly indolent, and it is often many years before it attains any considerable size. It is enclosed in a sac, its contents being sometimes sebaceous matter, in other cases serum, or a thin fetid brown or black fluid. Sometimes the sac contains cartilaginous or even osseous matter. Frequently the sac, especially when small, may be punctured, and its contents pressed out; but sometimes this gives rise to very severe inflammatory action. Another and safe mode of treatment is to dissect them out with the knife wherever their position will admit of it, care being taken to remove the whole of the cyst.

Wen-chow, wān' chow', China, a treaty port in the province of Che-kiang, on the estuary of the Ta-kai river, flowing into the China Sea; about 200 miles south by west of Shanghai.

Ruined palaces, gates, and triumphal arches are among the numerous signs of its vanished greatness, but it is still a comparatively clean town, with broad streets. Among buildings of recent erection are the custom-house and the branch of the Imperial Chinese Postoffice. The chief imports are cottons, kerosene, sugar, opium, iron, and woolens; the principal exports are tea, umbrellas, timber, and oranges. The average annual values of the imports and exports during several recent years were about \$850,000 and \$200,000 respectively. The tonnage of shipping is about 27,000 per annum. There is also a considerable junk trade. Pop. about 80,000.

Wenatchi. See SALISHIAN INDIANS.

Wenceslas, wén'st-s-lās or -lās, or **Wenzel**, Emperor of Germany and King of Bohemia: b. 1361; d. Schlagfluss 16 Aug. 1419. He was the son of Charles IV. (q.v.), whom he succeeded in 1378. In 1394 the Bohemian nobility formed a conspiracy against him and held him prisoner at Prague, but later released him. Through the influence of the archbishop of Mainz, whose enmity he had aroused by demanding the resignation of the rival Popes, Benedict XIII. and Boniface IX., he was deposed by the Imperial electors, while the Elector Palatine Rupert was chosen to succeed him. In Bohemia he supported John Huss (q.v.) and the latter's party, and in 1409 compelled by a decree the departure of the Germans from the University of Prague. Shortly afterward he resigned the royal title. Consult Lindner, 'Geschichte des Deutschen Reiches unter König Wenzel' (1875-80).

Wend Language. The language of the Wends is similar to the other branches of the northwestern stem of the Slavic languages, the Polish and the Bohemian. It is divided into the dialect of Lower Lusatia, which is but little developed, and that of Upper Lusatia. The latter is subdivided into the Evangelical dialect, near Bautzen; the Catholic dialect, near Kamenz and in the northwest; and the northeastern dialect. The differences are mostly confined to shades of pronunciation. The stock of words in the present language of the Wends is largely mixed with German elements. Orthography has always been in a very unsettled condition, and especially a subject of controversy between Catholics and Protestants; but in modern times attempts at reconciliation and improvement have met with approval on both sides. In their publications, the Wends have mostly made use of the German letters. There are eight vowels, *a, o, u, e, i*, all of which are pronounced as in German and Italian, *ö* (between *o* in *note* and *u* in *full*), *ê* (like long English *e*), and *y* (approaching the German *ü*). Of consonants there are 32: *j* (*y* consonant), *w* (*v*), *ŵ* (*v* soft), *b*, *ß* (soft), *p*, *f* (soft), *m*, *ñ* (soft), *n*, *ñ* (soft, Fr. *gn*), *l*, *ž* (like *v*), *r*, *ř* (soft), *s*, *š* (Fr. *j*), *z*, *ž* (*sh*), *d*, *ds*, *ds* (*dsh* soft), *ds*, *t*, *c* (*ts*), *č* (*tch* soft), *č* (*tch*), *ts*, *h*, *ch*, (*k*), *g* (hard), *k*. There is no article. The substantives are of three genders, masculine, feminine, and neuter. Substantives ending in a consonant are mostly masculine, those in *a* and *i* feminine, and those in *o* and *e* neuter. There are seven declensions, two for the masculine, three for the neuter, and two for the feminine. The language has a dual number.

There are seven cases, namely, nominative, accusative, genitive, dative, locative (to express the relation of *in*), instrumental (to express the relations of *by* and *with*), and vocative. The adjectives end in *y*, *i* (masculine), *a* (feminine), *o* and *e* (neuter). The comparative is formed by the termination *ij*, and in order to form the superlative the syllable *naj* is placed before the comparative. The personal pronouns are irregular; the others are declined like adjectives. The verb has six tenses, present, imperfect, perfect, pluperfect, future, and future perfect; five moods, indicative, subjunctive, optative, imperative, and infinitive, beside a gerund; and three participles, present and perfect active, and perfect passive. Till about the middle of the 19th century Wendish literature consisted almost wholly of ecclesiastical and religious works, and works relating to the needs of peasant life, but there has since been a revival of national feeling, accompanied by a more extended literature. There are grammars of the Wendish language by Lincus (Prague 1679), Matthäi (1721), Seiler (Bautzen 1830), and Jordan (Prague 1841).

Wendell, Barrett, American educator and author: b. Boston, Mass., 23 Aug. 1855. Graduated from Harvard in 1877, he studied also in the Harvard Law School, in 1880-8 was instructor in English at Harvard, in 1888-98 assistant professor, and in 1898 became professor. He was Clark lecturer at Trinity College, Cambridge, England, in 1902. Among his works are 'The Duchess Emilia' (1885); 'Rankell's Remains' (1897); 'English Composition' (1891); 'Cotton Mather' (1891); 'Stelligeri, and Other Essays Concerning America' (1893); 'William Shakespeare' (1894); 'A Literary History of America' (1900; in the 'Library of Literary History'), a scholarly work, though much criticised for its unjust attitude toward certain writers; and 'Raleigh in Guiana' (1902), an attempt at imitation of the Elizabethan drama. He also contributed the interesting chapter on 'The American Intellect,' to Vol. VII., 'The United States,' of the 'Cambridge Modern History.'

Wends, a former powerful Slavic tribe settled in Germany, now represented by the Slavic people of Upper and Lower Lusatia, who call themselves Serbs (*Serbo*), whence the name Sorbs, often applied to them by German authorities. In the earliest historical times the Sorbs occupied the country from the Saale to the Bober, and from the latitude of Berlin south to the Erzgebirge; but the Wends are now confined to a small territory (about 1,270 square miles) in the upper Spree valley, extending from south of Bautzen to north of Kottbus. The larger part of this Wendish region belongs to the Prussian provinces of Brandenburg and Silesia, the smaller southern part being included in the kingdom of Saxony (circle of Bautzen). The Wends are completely surrounded by Germans, and being thus cut off from contact with the other Slavs, they are becoming slowly Germanized. Their language, known as Sorbian, falls into two dialects, Upper and Lower Sorbian, which are spoken in the south and the north of the territory respectively. (See WEND LANGUAGE.) The total number of Wends is about 120,000, of whom about 50,000 live in Saxony and 70,000 in Prussia. About 12,000 are Roman Catholics, the remainder being chiefly Lutherans.

Wener, vā'nēr, or **Vener**, Sweden, the largest lake of the country, and after those of Ladoga and Onega the largest in Europe, situated centrally between the läns of Wernland, Dalsland, and Wester Götland. It is 147 feet above sea-level, and of irregular shape. Its greatest length, northeast to southwest, is about 100 miles; and its breadth may average about 30 miles, though in its lower part, where two peninsulas stretch far into it from opposite directions, it is not more than 15 miles. This distance is still further narrowed by a group of small islands, and hence the part of the lake above these peninsulas is sometimes considered as Wener proper, while the part below is called Lake Dalbo. The area covered by both is 2,242 square miles. By far the most important feeder is the Klar-elf, which pours in at its north end the accumulated water of a course of more than 250 miles. Its only proper outlet is at Wenersborg at its southwestern extremity, where its superfluous waters are received by the Göta-elf. In summer steamers and other vessels ply regularly upon the lake; in winter it is frozen for several months, and crossed by sledges. It abounds with fish, particularly trout. The Göta Canal connects Lake Wener with Lake Wetter, and the Dalsland Canal connects it with Fredrikshald in Norway.

Wenley, Robert Mark, American educator: b. Edinburgh, Scotland, July 1861. He was graduated from the University of Glasgow in 1884, and later studied in Edinburgh, and on the Continent. He was in charge of the philosophical department of Queen Margaret College, Glasgow, in 1888-95, and since 1896 has been at the head of that department in the University of Michigan. He has published: 'Socrates and Christ' (1889); 'University Extension Movement in Scotland' (1895); 'Contemporary Theology and Theism' (1897); 'Preparation for Christianity in the Ancient World' (1898); etc. He was an associate editor of the 'Dictionary of Philosophy.'

Wenlock Group, a British formation of the Upper Silurian geological series. It includes shales and limestones, and is below the Ludlow group, and above the Upper Llandovery group, these three comprising the Upper Silurian groups. The Wenlock formation is about 4,000 feet thick, and the fauna has been classed as consisting of 171 genera, and 530 species, but many supposed vegetable remains are almost certainly not such. See SILURIAN.

Wensleydale, wēnz'li-dāl, James Parks, Baron, English jurist: b. Highfield, near Liverpool, 22 March 1782; d. Ampthill Park, Bedfordshire, 25 Feb. 1868. Graduated from Trinity College, Cambridge, in 1803, he was called to the bar at the Inner Temple in 1813, went the northern circuit, and became known for his wide knowledge of common law. In 1828 he was made a justice of the court of king's bench, in 1834 was transferred to the court of the exchequer. Here he remained strongly influential until his resignation in 1856, when he entered the Lords as Baron Wensleydale of Walton (Lancaster). In Parliament he spoke rarely, and chiefly on legal questions. His judgments were highly ranked. Consult Foss, 'The Judges of England' (1848-64), or the abridgment of the same, 'Biographia Juridica' (1870); Manson, 'Builders of Our Law' (1895).

Wen'tistrap, a gastropod mollusk, allied to the turret shells and of the genus *Scalaria*, in which the shell is turreted, spiral, and ornamented with elevated rib-like processes, crossing the whorls lengthwise of the shell. In some species the spiral is closed; but in the "true" wentletraps the whorls are open, that is, separated. Of the former, some are found in northern seas, and the latter are all natives of warm seas. They are inhabitants of deep waters, but their shells are cast up in great numbers on sandy coasts. They are carnivorous in habits. The famous precious wentletrap, or royal staircase (*Scalaria pretiosa*), formerly brought prices ranging as high as \$250 when purchased for the conchologist's cabinet, but its value in the present day is small. Its shell is about two inches long, and twisted in a wide spiral form, and is generally pale-yellow with white ribs.

Wentworth, wēnt'wérth, Benning, English governor of New Hampshire: b. Portsmouth, N. H., 24 July 1696; d. there 14 Oct. 1770. He was graduated at Harvard in 1715, became a merchant at Portsmouth, which town he frequently represented in the provincial assembly, was appointed a king's councillor in 1734, and when in 1741 New Hampshire was made a distinct province he became its governor. He so continued until 1767, when he resigned. He was authorized by the crown to grant patents of unoccupied land, and in 1749 began making grants on the west side of the Connecticut River, in what is now southern Vermont. These grants were considered by the colonial government of New York as within its domain, and, as Governor Wentworth stoutly maintained for a time his authority, the collision so famous in the history of Vermont respecting the New Hampshire grants ensued. (See VERMONT, History.) Governor Wentworth exacted heavy fees for his grants of land, and thus accumulated a large property, and in all of them stipulated for the reservation of a lot for an Episcopal church. The town of Bennington, Vermont, was named in honor of him. After his resignation as governor he gave to Dartmouth College 500 acres of land, on which the college buildings were erected. For an account of his second marriage, consult Longfellow's poem 'Lady Wentworth.'

Wentworth, Charles Watson. See ROCKINGHAM, 2d MARQUIS OF.

Wentworth, George Albert, American mathematician: b. Wakefield, N. H., 31 July 1835; d. Dover, N. H., 24 May 1906. He was graduated from Harvard in 1858 and in 1858-91 was professor of mathematics at Phillips Exeter Academy. With G. A. Hill he prepared a series of text-books on algebra, arithmetic, geometry, and physics, and he was author of the Wentworth Series of mathematical works comprising about 40 volumes, among which are: 'Elements of Geometry' (1878); 'Surveying and Navigation' (1882); 'Higher Algebra' (1891); etc.

Wentworth, Sir John, English colonial governor of New Hampshire and afterward of Nova Scotia: b. Portsmouth, N. H., 9 Aug. 1737; d. Halifax, N. S., 8 April 1800. He was a nephew of Benning Wentworth (q.v.). He was graduated at Harvard in 1755, being a classmate of John Adams, became a merchant, and in 1765 was the agent of New Hampshire to present petitions in England. While there he was ap-

pointed to succeed Benning Wentworth as governor of New Hampshire. At the same time he was made "surveyor of the king's woods" for all North America. Having landed at Charleston, S. C., in March 1767, he traveled through the colonies, registering in each his commission as surveyor, and arrived at Portsmouth in June. The office of governor was at that time an extremely difficult one by reason of the increasing discontent of the colonists. At the first, Wentworth's administration was very popular. He remonstrated against the taxes imposed by the English government, but sought to maintain the loyalty of the colony, and was successful in preventing the assent of Portsmouth to the non-importation agreements until 1770. In this he was aided by the fact that the Portsmouth merchants were disinclined to forego such profits as they might still obtain despite the crippled state of commerce. When the last attempt was made to compel the colonies to receive East Indian tea, he took advantage of lack of instructions from the government, and had the consignee reship the cargo to Halifax. His authority ended, however, when it was learned that he had endeavored to comply with the request of General Gage to obtain carpenters to construct barracks for the British troops at Boston, after Massachusetts workmen had refused the task. On 14 Dec. 1774 an armed attack was made on Fort William and Mary (now Fort Constitution) on Great Island, at the entrance to Portsmouth harbor, and 100 barrels of powder and some cannon and muskets were taken. Wentworth finally found it advisable to withdraw to the fort, and then to a warship in the harbor. At the Isle of Shoals he prorogued the assembly, his last official act. He went to Boston, and thence to England. From 1792 to 1808 he was lieutenant-governor of Nova Scotia. He was active in the foundation of Dartmouth College. Nine MSS. volumes of his correspondence are in the public records of Halifax. He was made a baronet in 1795.

Wentworth, John, American journalist: b. Sandwich, N. H., 5 March 1815; d. Chicago, Ill., 16 Oct. 1898. He was graduated from Dartmouth in 1836 and the same year went to Chicago where for 25 years he was owner and editor of the 'Democrat.' He studied law, was admitted to the bar in 1841, and in 1843 was elected to Congress where he served six terms. He introduced the first steam fire engine into Chicago, was active in procuring the city charter, an earnest promoter of the public school system, and in 1857 and 1860 was elected mayor. He dissolved his connection with the 'Democrat' in 1861, but did not retire from active life for many years. He gave \$10,000 to Dartmouth College, was president of its alumni in 1883 and wrote: 'Descendants of Elder William Wentworth' (1850); and 'History of the Wentworth Family' (1878).

Wentworth, Thomas. See STRAFFORD, 1ST EARL OF.

Werff, v'erf, Adriaan van der, Dutch painter: b. Kralingen, near Rotterdam, 21 Jan. 1659; d. Rotterdam 12 Nov. 1722. He became a pupil of Van der Neer, settled in Rotterdam, and in 1696 attracted the notice of the Elector Palatine, who was thenceforward his liberal patron, and who ennobled him in 1703. Among his celebrated paintings are the 'Judgment of

Solomon'; 'Christ Carried to the Sepulchre'; 'Ecce Homo'; 'Abraham with Sarah and Hagar'; and 'Magdalen in the Wilderness.' Van der Werff was particularly noted for his small historical pieces, which are most exquisitely finished, and are still in high request. His brother and pupil, **Pieter van der Werff** (1665-1718), painted portraits and domestic pieces.

Wergild, *wér'gild*, or **Weregild**, *wér'gild*, derived from the Anglo-Saxon *werr*, a man, and *geld*, satisfaction, and meaning the price in money paid either to kinsmen or to the state, or both, as satisfaction in a case of homicide or other crime against the person. The wergild extended to offenses of the highest grade. It was also sometimes exacted when the killing was not criminal, as in the case of a thief slain in battle. It was eminently a Teutonic institution, and the amount of wergild varied with different tribes. Among the Anglo-Saxons the wergild for taking the life of the king was 7,000 shillings; for an eolderman 2,400 shillings; a king's thegn 600 and a ceorl 200. In the Anglo-Saxon period an alderman or eolderman was a much more important personage than the alderman of to-day, the aldermen of all England being the first subjects of the realm, and other aldermen being governors of counties. Even kings were called aldermen. The thegn, or thane, was a minor noble, and the ceorl, or churl, a tenant-at-will of the thane, or he might be simply a serf or farm-laborer. As the value of money, measured by its purchasing power, was far greater than to-day, the wergild for king and alderman, and even for thane, must have been prohibitory save for the wealthiest members of the community, or when the state assumed the burden of payment, as in the case of an enemy of high rank killed in war, whose relatives were able to wreak vengeance for his death.

Wergild for a homicide had to be paid to the king and the kindred, and also to the thane, or overlord of the slain man. The relatives were not obliged to accept the price of their kinsman's blood, but might, if they chose, exact life for life. If the relatives were satisfied, however, it was not difficult to make terms with the king and thane. The wergild passed away when Norman succeeded to Anglo-Saxon rule, and while fines continued to be imposed on offenders, there was no escape from the capital penalty for homicide except in trial by combat.

Wergeland, *vér'gè-lánd*, **Henrik**, Norwegian poet: b. Christiansund 17 June 1808; d. Christiania 12 July 1845. He studied at Christiania, in 1836 became custodian of the university library, and in 1840 keeper of the Norwegian archives. He was one of the leaders of the Ultra-Norwegian party, waging war on all things Danish, but found opponents in Welhaven and the latter's school. In 1830 he published the dramatic poem 'The Creation, Man and Messiah,' a work of formidable length and slight literary merit. His chief publications are the narrative poems, 'Jan van Huysum's Flower-Piece' (1840); 'The Swallow' (1841); 'The Jew' (1842); 'The Jewess' (1844), and 'The English Pilot' (1844), which take high rank in Norwegian verse. His complete collected works appeared in 1852-7, a selection in 1859. Consult the biographies by Lassen (1867), Schwanenflugel (1877), and Skavlan (1892).

Werner, vēr'nēr, Abraham Gottlob, German mineralogist; b. near Bunzlau, 25 Sept. 1750; d. Dresden 30 June 1817. In 1775 he was appointed inspector and teacher of mineralogy and mining in the Mining Academy at Freiberg, in which position he remained for the rest of his life. He was the first to separate geology from mineralogy, and to place the former on the basis of observation and experience. The geological theory with which his name is connected is that which attributes the phenomena exhibited by the crust of the earth to the action of water, and is known as the Wernerian or Neptunian theory, in contradistinction to the Huttonian or Plutonic. He was nominated counsellor of the mines of Saxony in 1792, and had a great share in the direction of the Academy of Mining, and in the administration of public works. He published 'Kurze Klassifikation und Beschreibung der Gebirgsarten' (1787); 'Neue Theorie über die Entstehung der Gänge' (1771). Consult 'Life' by Frisch (1825).

Werner, Friedrich Ludwig Zacharias, German dramatist. b. Königsberg 18 Nov. 1768; d. Vienna 17 Jan. 1823. After attending Kant's lectures in his native town, he became in 1793 chamber secretary in the Prussian service, and in 1805 obtained a government post in Berlin, but two years later he retired from the public service. In 1811 he joined the Roman Catholic Church, and in 1814 was consecrated priest at Aschaffenburg. Taking up his residence in Vienna, he became known as an eloquent preacher and later was appointed head of the chapter of the cathedral of Kammer. Werner's dramatic works reveal much of the power and pathos characteristic of Schiller, but overlaid to a constantly increasing extent, as he advanced in years, by mystical and undramatic elements. The chief of them are: 'Die Söhne des Thals' (1804); 'Das Kreuz an der Ostsee' (1806); 'Martin Luther oder die Weihe der Kraft' (1807); 'Attila' (1808); 'Wanda' (1810); 'Die Weihe der Unkraft' (1813), a sort of retraction of the earlier play on Luther; 'Kunigunde die Heilige' (1815); 'Der 24. Februar' (1815); 'Die Mutter der Makkabäer' (1820).

Wernerite, an important rock-forming mineral, occurring in cleavable-granular, indistinctly-fibrous or columnar masses, or often in large, coarse crystals. These are tetragonal prisms terminated by pyramids, and show good prismatic cleavage. The hardness is 5 to 6 and specific gravity about 2.7. The most common colors are white or gray; lilac is also quite abundant; occasionally greenish and brick-red varieties are found. Wernerite is a member of the scapolite group (q.v.) and is intermediate in composition between meionite and marialite, being a silicate of aluminum, calcium and sodium, with chlorine. It usually occurs in crystalline limestone. Among its many localities a few of the most important are Arendal, Norway; Bolton, Massachusetts; northern New York, Ontario and Quebec. The mineral was named (in 1800) in honor of the distinguished mineralogist, A. G. Werner.

Werwolf, wēr'wulf, or Werewolf, wēr'-wulf, a human being transformed into a wolf, according to a belief which has prevailed in all ages and ignorant and superstitious communities. Herodotus, with great naïveté, tells us that when he was in Scythia he heard of a people which

once a year changed themselves into wolves, and then resumed their original shape; "but," adds he, "they cannot make me believe such tales, although they not only tell them, but swear to them." But the lycanthropes of the Middle Ages, or *loup-garous*, as they were called by the French, were sorcerers, who during their wolf-hood had a most cannibal appetite for human flesh. The Germans called them *Währwölfe*. Many marvelous stories are told by the writers of the Middle Ages of these wolf-men or *loup-garous*, and numerous authentic narratives remain of victims committed to the flames for this imaginary crime, often on their own confessions.

It is certain that faith in the power of witches to assume the shape of animals, such as wolves, dogs, cats, or horses, existed at a comparatively recent time, and is probably not extinguished yet in Western Europe. In the Balkan States, or part of them, belief in the werwolf flourishes to this day, along with the kindred vampire superstition. An old writer says that "the werewolves are certain sorcerers, who, having anointed their bodies with an ointment which they make by the instinct of the devil, and putting on a certain enchanted girdle, do not only unto the view of others seem as wolves, but to their own thinking have both the shape and nature of wolves, so long as they wear the said girdle; and they do dispose of themselves as very wolves, in worrying and killing, and most of human creatures."

The werewolves were said to have in some instances a special hatred of religion and its devotees, and this, coupled with the charge of devouring human flesh, left no doubt as to the fate of anyone who fell under suspicion of being a werwolf. The superstition itself was doubtless due in part to the brutal and savage aspect of human beings who, owing to melancholia or other forms of insanity, went wild in the woods—an occurrence not infrequent in remote districts in the Middle Ages. It was also in all probability connected with the belief, which was a prominent feature of mythology, in the power of the gods and inferior spirits to enter the bodies of animals, and with the doctrine of transmigration of souls, common alike to the ancient Egyptians, the followers of Pythagoras and the Hindus. See WITCHCRAFT.

Wesel, vā'zēl, Germany, a town in the Rhine province of Prussia, on the right bank of the Rhine, at the mouth of the River Lippe, 35 miles north by west of Düsseldorf. The Rhine is here crossed by a railway and a pontoon bridge, and the Lippe by a railway and two other bridges. The fortifications were demolished in 1890, except the citadel and four outer forts, one of which, Fort Blücher, is on the left bank of the Rhine. The Berlin gate, with statues of Hercules and Minerva, dates from 1722. The principal church was founded in the 12th century, and dates in its present form from 1521. It was restored in 1883-96. The town-hall, with a Gothic façade, was completed in 1390. The other buildings and institutions include the Lower Rhine Museum, formerly a French church; the artillery barracks, formerly a Dominican monastery; a royal gymnasium and other higher educational institutions; two hospitals, an orphanage, and the fortress prison. Soap, wire, and cement are manufactured, and

there are also sugar refineries, brick works, flour and oil mills, steam saw-mills, etc., besides a trade in timber, grain, etc. There is ample harbor and quay accommodation. Wesel can be traced back to the 8th century. It was a member of the Hanseatic League, and adopted the Reformation in 1540. It came into Prussian possession in 1814.

Weser, vä'zër (Latin, *I'isurgis*), a river of Germany, formed by the junction of the Fulda and Werra at Münden, between the provinces of Hanover and Hesse-Nassau. It flows tortuously first northwest, then north-northeast between Westphalia and Brunswick and after a circuitous northwestern course, traverses the town and the territory of Bremen, forms the boundary between Hanover and Oldenburg, at Elsfleth turns almost due north, and falls by a wide mouth, encumbered with sandbanks, into the German Ocean. Its whole course is about 430 miles. It is navigable by barges to some distance up both head-streams, but the practical limit of summer navigation is Hameln. The lower part, from Bremen to Bremerhaven, has been deepened and improved for large vessels.

Wesley, wës'li, Charles, English clergyman and hymn-writer, younger brother of John Wesley: b. Epsom, Lincolnshire, 18 Dec. 1707; d. London 29 March 1788. He was educated at Christ Church, Oxford, and there he began, he says, "to observe the method of study prescribed by the university," adding, "this gained me the harmless nickname of Methodist"—a word at first apparently without religious significance, and meaning one who affected method. In 1735 he was ordained priest. Charles accompanied his brother to Georgia, where he was not very successful, and having returned to England in 1736, became unlicensed curate of St. Mary's, Islington, where he remained until 1739. In 1739-56 he was an active itinerant preacher. He differed from his brother on some doctrinal and other points, holding, for example, that perfection must be attained by a gradual process. After residing for some years at Bristol and Bath, he went to London in 1771. He is said to have written 6,500 hymns, of which many are well known, about 500 being said to be in general use. Consult the biographies by Jackson (1849) and Telford (1866), and Julian, 'Dictionary of Hymnology' (1892).

Wesley, John, English clergyman, founder of Methodism: b. Epworth, Lincolnshire, 17 June 1703; d. London 2 March 1791. He was a younger son of the Rev. Samuel Wesley (q.v.), and was educated at Charterhouse, and at Christ Church, Oxford. He took his degree in 1724, was ordained deacon in 1725 and became a fellow of Lincoln College, in which he was appointed Greek lecturer and moderator. He was of a serious and religious turn of mind, and books which impressed him powerfully were the 'Imitatio Christi' and Taylor's 'Holy Living and Holy Dying.' He took priest's orders in 1728, and about the close of 1729 was called from acting as his father's curate to perform the duties of his fellowship in person. At Oxford he found an association of students of which his brother Charles was a member. It was known by various nicknames, among which were the Holy Club, the Bible Moths, the Sacramentarians, and the Methodists. It appears that all the associ-

ation did at this time to earn these opprobrious epithets was to meet on Sunday evenings to read the Scriptures, and on other evenings to read secular literature. John Wesley joined this society, which gradually became exclusively religious in its object, and highly ascetic in its tone. Its members fasted twice and communicated once a week, visited prisons and the sick, and engaged frequently in prayer, meditation, and self-examination. Among the members were Hervey and Whitefield. At the time John Wesley joined it the society numbered very few members, but it gradually increased, though it never became a large body. This induced him to decline his father's living at Epworth, that he might continue to exercise his influence at the university. During his residence at the university he became acquainted with Law, author of the 'Serious Call to the Unconverted,' who exercised much influence over him. In 1735 he accepted an invitation from Gen. Oglethorpe to preach to the colonists of Georgia. He sailed on 10 Dec. with his brother Charles and a considerable body of Moravians. During his visit to the colony he paid his addresses to Sophia Hopkey, niece of the chief magistrate of Savannah, or rather, as the story is told, received her advances with favor, but ultimately declined to marry her. Miss Hopkey married a Mr. Williamson, and Wesley, without assigning a reason, refused to admit her to the communion. Her husband threatened legal proceedings, which were not enforced, but Wesley, on account of this event, left the colony, "shaking the dust from his feet." He reached England 1 Feb. 1738, just as Whitefield, under whose preaching Methodism had made great progress, sailed for Georgia. At this time an important event took place in the inner religious life of Wesley. He was converted, according to his own account, about a quarter to 9 o'clock on the evening of 24 May 1738, at a meeting to which he had gone very unwillingly, while Luther's 'Preface' to the Epistle to the Romans was being read. On 13 June he set out for Germany to visit Herrnhut. He met Count Zinzendorf at Marienborn, spent a fortnight at Herrnhut, and returned to England about the middle of September. Whitefield returned from Georgia soon after, and became intimately associated with Wesley. He began open-air preaching near Bristol in the following February, and his example was soon followed by Wesley. On 11 Nov. 1739 Wesley first preached at the Foundry, a disused structure, formerly employed by the government for casting brass ordnance. This he enlarged and repaired, and until 1778 it remained the Methodist headquarters in London. Somewhat later he founded the 'United Society' for week-day meetings. From the beginning of this society the inception of Methodism is generally dated.

In July 1740 Wesley separated from the Moravians, on account of doctrinal differences. He soon afterward separated from Whitefield, but without a permanent personal breach. Wesley had now sole control of the religious body which adhered to him, and he devoted his entire life without intermission to the work of its organization, in which he showed much practical skill and admirable method. His labors as an itinerant preacher were incessant. He had no permanent residence, and never inter-

mitted his journeys on account of the weather. He would ride from 40 to 60 miles in a day, read or wrote during his journeys, and frequently preached four or five times a day or oftener. He married in 1750 Mrs. Vazeille, a widow with four children, but his habits of life, which he did not attempt to accommodate to his wife, produced an alienation, and they finally separated. Wesley held strongly to the principle of episcopacy, though not a believer in the apostolic succession; and he never formally separated from the Church of England. His collected works were published by himself in 1771-74 in 32 volumes. But in these only a part of his literary output was included, his publications being of the most miscellaneous character, including grammars, an English dictionary, biographies, manuals of history, logic, medicine, which together brought him in large sums of money. In 1780 he commenced a monthly, the 'Arminian Magazine,' which he edited during his life, and which after his death was merged in the 'Methodist Magazine.'

Against pre-Revolutionary troubles in America he directed 'A Calm Address to our American Colonies' (1775), 'A Calm Address to the Inhabitants of England' (1777), and 'A Serious Address' (1778). He also wrote many hymns, which are included in the 'Poetical Works of John and Charles Wesley' (1868-72). A John Wesley bicentary was celebrated in June 1903. Consult the biographies by Hampson (1791); Coke and Moore (1792); Whitehead (1791-3); Moore (1824-5); Southey (1820), with 'Notes' by Coleridge and 'Remarks' by Knox, in 1846; Watson (1831); Tyerman (1870-1); Rigg (1875); Green (1881); and Overton (1891); Wesley's 'Journals' and 'Correspondence,' parts of which are to be found in the various editions of his collected works, first published under his own editorship in 1771-4; Taylor's 'Wesley and Methodism' (1851); Urlin, 'Wesley's Place in Church History' (1870); a bibliography by Green (1896); and standard histories of Methodism. See also **METHODIST EPISCOPAL CHURCH, THE**.

Wesley, Samuel, English clergyman and poet: b. Winterborne-Whitchurch, Dorsetshire, 17 Dec. 1662; d. Epworth, Lincolnshire, 25 April 1735. He was the father of Charles, John, and Samuel Wesley, Jr. Graduated from Exeter College, Oxford, in 1688, he was ordained priest in 1690, became rector of South Ormsby, Lincolnshire, in that year, and in 1695 of Epworth in the same county. He wrote 'Life of Christ: An Heroic Poem' (1693); 'Eupolis's Hymn to the Creator' (1778); and other works, including the posthumous 'Dissertations in Librum Jobi' (1735), etc. He is best known by the two hymns to be found in Methodist hymn books, 'Behold the Saviour of Mankind' and 'O, Thou, Who, When I Did Complain.'

Wesley, Samuel, English hymn-writer, son of the preceding: b. Spitalfields, London, 10 Feb. 1691; d. Tiverton 6 Nov. 1739. He was head-master of Bundell's grammar school in Tiverton, in 1732-30. He did not embrace Methodism with his brothers, and wrote of it as "a spreading delusion." He was graduated from Christ Church, Oxford, in 1715, and took orders. He is best known by his hymns in the Methodist hymn book. Among the titles of individual

volumes by him were: 'Poems on Several Occasions' (1736); reprinted in 1808 and 1862; and 'The Christian Poet' (1735). Consult: Tyerman, *Life and Times* (1866).

Wesleyan Methodists. See **METHODISM IN AMERICA**.

Wesleyan University, located at Middletown, Conn. It was established in 1831 under the auspices of the Methodist Episcopal Church, being the first educational institution of collegiate grade established by that church in the United States. The founders of the college were offered the buildings and site of the American Literary, Scientific and Military Institute, if an endowment of \$40,000 were raised; the gift was accepted and its conditions complied with. In 1868-78 the university's material resources were largely increased, and several new buildings erected; in 1872 women were admitted, and in the same year a new curriculum established with a wide range of electives; in 1900 the number of women admitted was limited to 20 per cent of the whole number of students in the preceding year. The university offers three courses, classical, Latin-scientific, and scientific, leading to the degrees of A.B., Ph.B., and B.S., respectively. In each of these courses the work of the first year is nearly all required; after the first year, the amount of required work is progressively diminished; a wide range of electives is offered, naturally limited to a certain extent by the degree to be obtained. Courses in graduate work are provided leading to the degrees of A.M. and M.S. There are five endowed scholarships, also the scholarships established by the trustees for the payment of the tuition of students considered worthy of such assistance. The students maintain an athletic association, a university glee club, mandolin and guitar clubs, and a number of the Greek letter fraternities; these latter have their own houses where many of the students live. Athletic sports are under the control of an athletic council on which undergraduates, alumni, and faculty are represented. The university has a campus of 14 acres on high ground overlooking the Connecticut River; the buildings include North College (the first building erected by the Military Academy), South College, the Judd Hall, the observatory, with a 12-inch equatorial telescope, Rich Hall (the library), the Wilbur Fisk Recitation Hall, and the Scott Laboratory of Physics, both erected in 1903, and the Fayerweather Gymnasium. The library in 1904 contained 63,000 volumes. In 1902-3 a movement was begun to raise \$1,000,000 to add to the endowment fund. The students in 1910 numbered 365, of whom about 50 were women; the faculty numbered 42.

Wessel, vés'sel. Johann (surnamed **GANSEVOORT** (Dutch, **GONSEVOORT**), Dutch theologian: b. Groningen 1419 or 1420; d. 1489. He passed the latter part of his life in retirement in his native country, part of the time in convents. He was a decided opponent of the scholastic theology, and in intimate relations with some of the prominent humanists, as Agricola and Höck, yet in his own views leaned strongly toward mysticism. He regarded Christianity as something entirely spiritual, confined to a man's own heart and God. The Scriptures, according to him, are the living source of all true faith; the Church is based upon a compact; there is a

WESSEX — WEST BAY CITY

general priesthood of the rational universe; faith is to be reposed only in an orthodox pope, and not in every council; sin can be forgiven by none but God; excommunication has only an external influence; indulgences refer only to ecclesiastical penalties; the true satisfaction for sin is a life in God; and purgatory is nothing but the purifying influence of a longing after God. After his death some of his works were burned as heretical; his 'Farrago Rerum Theologicarum' was published with a preface by Luther (1522). The most complete edition of his works is that edited by Lydius (1617). Consult Muusling, 'Commentatio Historica-Theologica de Wesseli' (1831); Ullmann, 'Reformatoren vor der Reformation' (1847).

Wessex, wēs'ēks, England, a former kingdom, from the 6th to the 9th century, one of the most important of the Saxon heptarchy, and that in which the other kingdoms were ultimately merged in the reign of Egbert in 827. Wessex, signifying West Saxons, as an independent unit of the heptarchy, occupied a territory now comprised in Dorset, Wilts, and parts of Somerset and Hants. See EGERT; ENGLAND.

West, Benjamin, American painter: b. Springfield, Chester County, Pa., 10 Oct. 1738; d. London 11 March 1820. After some instruction from William Williams, a Philadelphia painter, and having painted 'The Death of Socrates' for a gunsmith, he established himself as a portrait painter at Philadelphia at five guineas per portrait, and subsequently followed the same profession in New York. In July, 1760, he visited Rome, whence he proceeded to Florence, Bologna, Venice, and Parma. Returning to Rome, he painted 'Cimon and Iphigenia' and 'Angelica and Medora.' He was elected member of the Academies of Florence, Bologna, and Parma, and, visiting England in 1763, was so well patronized that he determined to make it his future residence. He executed a historical painting of 'Agrippina Landing with the Ashes of Germanicus,' for Drummond, archbishop of York, who introduced him to George III. The king became his steadfast patron, and gave him commissions for many years. In 1772 he was made historical painter to the king, in 1790 surveyor of the royal pictures. He was one of four selected to draw up a plan of the Royal Academy, was one of the original members, and there exhibited his 'Death of General Wolfe' (now in the Grosvenor gallery, London), in 1771. In this canvas West departed from the custom of the artists of the day of giving the characters Greek or Roman costumes. Reynolds, who had endeavored to dissuade him, later said, "I retract my objections. I foresee that this picture will not only become one of the most popular, but will occasion a revolution in art." Woollett's plate after this work had the largest sale of any engraving of modern times. West painted a series of historical works for Windsor, and for the chapel a series on the progress of revealed religion, divided into four series, antediluvian, patriarchal, Mosaic, and prophetic. On the death of Reynolds, in 1792, he was unanimously elected president of the Royal Academy. When George III. became insane the order for painting the religious series was abruptly recalled and the pay stopped.

West had finished 26 pictures, and sketched the entire series. He afterward painted a number of religious and historical pictures on very large canvases. Among them may be noticed 'Christ Healing the Sick' (in the National Gallery), the 'Crucifixion,' the 'Ascension,' and 'Death on the Pale Horse' (Pennsylvania Academy). The 'Battle of La Hogue' is among the best of his historical pieces. West's pictures numbered about 400. They are chiefly of heroic size, and display much inventive power and great skill in composition. But they are monotonously reddish-brown in coloring, and, despite their facility, lack spirit and imaginative value. His position in early American art has won for him a recognition somewhat in excess of his actual merit. Consult Galt, 'Life and Studies of Benjamin West' (1820); Tuckerman, 'Book of the Artists' (1867); and various dictionaries of art.

West, James Harcourt, American publisher and Unitarian clergyman: b. Melrose, Mass., 13 Jan. 1856. He was educated at Tufts Divinity School, was engaged in printing and as a newspaper correspondent in 1873-84, and in 1884-94 was minister in charge of various Unitarian and Congregational Societies. He founded the 'New Ideal Magazine' in Boston in 1889 and has been engaged as a publisher since 1888. His writings include: 'Holiday Idlesse, and Other Poems' (1886); 'Uplifts of Heart and Soul' (1887); 'The Complete Life' (1888); 'Visions of Good—Poems of Freedom' (1892); 'In Love with Love' (1894); etc.

West, Thomas, BARON DELAWARE OF DELAWARE, English colonial governor of Virginia: b. 9 July 1577, d. at sea off the Atlantic coast of America 7 June 1618. He was educated at Queen's College, Oxford, in 1597 was returned to Parliament for Lymington, fought in the Low Countries and in Ireland, in 1609 became a member of the council of the Virginia Company, and in 1610 was made first governor and captain-general for life. On 10 June he arrived at Jamestown, where he soon restored order and comparative prosperity. He established a post at Riquotau (now Hampton), and built two forts. At the time of his coming want and mismanagement had almost compelled the settlement to disperse. By June 1611 he was again in England, where he printed a very favorable report as 'The Relation of the Right Honorable the Lord De-La-Warre.' In March 1618 he set sail once more for Virginia, but he died on the voyage. Consult Neill, 'The Early Settlement of Virginia' (1878); 'Proceedings of the Virginia Company' (Virginia Hist. Soc. 1880).

West Bay City, Mich., city on the Saginaw River, and on the Grand Trunk, the Michigan C., and the Detroit & M. R.R.'s; opposite Bay City and 12 miles north of Saginaw. It is connected with Bay City by several railroad bridges. It is in an agricultural region, and it has a number of industries connected with lumber products. The chief manufacturing establishments are flour mills, lumber and planing mills, sugar-beet factory, sash and door factories, chicory factory, and salt works. It has also shipyards, foundry, and machine shops. In 1900 (government census) the city had 121 manufacturing establishments, which were capitalized for \$2,323,910 and in which were 2,153

WEST BEND—WEST INDIES

employees whose annual wages amounted to \$868,504. The raw material used in the manufacturing cost, each year, \$2,204,668 and the value of the annual products was \$3,763,522. The city owns and operates the electric-light plant and the water-works. The educational institutions are a public high school, public and parish graded schools, and a public library. The two banks have a combined capital of \$100,000 and deposits amounting to \$618,900. Bay City and West Bay City have been merged (1910) into the one municipality, Bay City (q.v.). The government of West Bay City was administered under a charter (1897) which provided for a mayor, who held office two years, and a council. Pop. (1890) 12,981; (1900) 13,119; of Bay City (1910) 45,166.

West Bend, Wis., city, county-seat of Washington County; on the Milwaukee River, and on the Chicago & Northwestern Railroad; about 35 miles north of Milwaukee. It is in an agricultural and stock-raising region. The chief manufactures are flour, beer, harnesses, spokes, hubs, and pocket-books. It has grain elevators, machine shops, foundry, and creamery. There are six churches, public and parish schools, and one bank. Pop. (1910) 2,462.

West Bromwich, brūm'ich, England, a manufacturing town in Staffordshire, between Wednesbury and Birmingham. The principal buildings include the town-hall with a massive tower; a number of fine modern churches; several chapels of different denominations; public schools; an institute, art and technical schools, a free library, and a hospital. There is a fine public park. West Bromwich has a share in the mining and manufacturing industries of this busy district, and has grown largely of late years, carrying on the manufacture of iron goods of various kinds, smelting, brass-founding, etc. Pop. about 68,000.

West Chester, Pa., borough, county-seat of Chester County; on the Wilmington & B. and the Philadelphia R.R.'s; about 27 miles west of Philadelphia. It was originally called Turk's Head, but in 1786 the county was divided, and the name was changed to West Chester when it was made the county-seat. The new county was called Delaware, but it retained the old county-seat, Chester.

West Chester has a number of manufacturing establishments, among which are carriage factories, creameries, sash and door factories, and manufactures of hosiery, umbrella tags, and wood products. The principal public buildings are the Chester County Hospital, the county court-house, prison, theatres, a large convent, and the municipal buildings. Marshall square contains a soldiers' monument and a handsome fountain. The educational institutions are a State Normal School, Villa Maria Academy, Friends' Select School, The Darlington Seminary, West Chester Business College, a public high school established in 1865, public and parish schools, a public library, a law library and three school libraries. There are eight banks; the three national and one of the state banks have a combined capital of \$650,000, and the five (national and state) have (1903) deposits amounting to \$2,864,050. Pop. (1890) 8,028; (1900) 9,524; (1910) 11,767.

West Farnham, Canada. See FARNHAM.

West Hoboken, N. J., town in Hudson County; adjoining Hoboken and near Jersey City; about one and one half miles from the Hoboken ferry on the Hudson River. It is on elevated land which rises somewhat abruptly from the land along the river at Hoboken. In 1900 (government census) the town had 177 manufacturing establishments, which were capitalized for \$4,042,373 and in which there were 3,028 employees, to whom were paid annually, \$1,248,244. The total cost of the raw material used annually was \$2,829,789, and the value of the finished products was \$5,491,760. The five silk factories were capitalized for \$3,327,900. They used annually raw material which cost \$2,117,267, and the value of the yearly products was \$3,661,054. The principal public buildings are Saint Michael's Monastery (Passionist Fathers) and the Dominican Convent. The educational institutions are a theological school, at the Monastery, for their own members, a high school established in 1897, public elementary schools, and two large parish schools. The Hudson Trust Company has a capital of \$900,000, and (1903) deposits amounting to \$8,500,000. Pop. (1890) 11,665; (1900) 23,049; (1910) 35,403.

West Houghton, hō'ton, England, a township in Lancashire, five miles west-southwest of Bolton, with manufactures of silk and cotton, and coal-mining.

West Indies (more precisely, **West Indian Islands**, the name "West Indies" having for centuries been employed to designate parts of the mainland as well, and being still so used by some good writers): the archipelago which includes the Bahamas and the Great and Lesser Antilles. The total land area is about 95,000 square miles—twice the size of New York; the islands are, however, dispersed far and wide over a region continental in size, which extends from lat. 10° N. to 28° N. and from lon. 58° W. beyond 85° W. For the geographical subdivisions of the main groups, see ANTILLES and BAHAMAS; for the geologic relations of some of them to the mainland portions of the Antillean continent, see CENTRAL AMERICA and CARIBBEAN SEA. It will presently be made clear that the resemblances between the islands are actually less marked than the differences, and it is obviously true that the latter are very much the more worthy to receive attention at a time when one island after another claims the sympathy of the world—and especially of the United States—on the ground that its conditions are exceptional; the reader is therefore referred to the separate articles PORTO RICO, CUBA, SANTO DOMINGO, DOMINICAN REPUBLIC, JAMAICA, MARTINIQUE, DOMINICA, GRENADA, GUADELOUPE, BARBADOS, etc., in which the characteristic features of each are mentioned, though briefly. The distinctions cannot be quite fairly or helpfully presented in any other way, since every important insular community must eventually form the subject of a separate study.

To pass from a western to an eastern point in this archipelago, one may be obliged to sail about 2,000 miles; and to pass from its northernmost to its southernmost island one must sail more than 1,500 miles. This wide dispersion is the fact which should be first noted. The next step is to realize fully the disjunctive political conditions, the results of the distribu-

WEST INDIES

tion of the islands among a number of competing nations. Let us now consider the political subdivisions. The British possessions are The Bahamas, including 20 inhabited and many desert islands; Jamaica, with dependent Cayman Islands, etc.; Windward Islands, including Grenada (the governor's residence), Saint Lucia, Saint Vincent and the Grenadines, Barbados, east of the Windward Islands, Leeward Islands, comprising Antigua (seat of the government of the colony), the Virgin Islands, Saint Kitts (Saint Christopher), Nevis, Anguilla, Dominica and Montserrat, and Trinidad and Tobago, near the South American coast. The annual value of the exports from the British West Indian Islands is about \$31,500,000 (approximate average for the years 1899-1901), and of their imports about \$34,000,000; revenue and expenditure (exclusive of parliamentary grants) each being about \$10,000,000 annually during the same period of three years. The Danish possessions are the small islands of Saint Thomas, Saint Croix or Santa Cruz and Saint John, with total area 138 square miles, population 120,892 (in 1901), and foreign trade about \$30,000 in the same year, imports being valued at a little more than exports. A treaty for the sale of these islands to the United States was signed 24 Jan. 1902, and rejected by the Danish Landsting 22 October next following. French possessions are: Guadeloupe and its dependencies, and Martinique, their total area being about 1,068 square miles and total population about 360,000, combined exports about \$8,500,000 and imports about \$9,500,000. A French and Dutch possession is the island of Saint Martin, 38 square miles in area, of which it has been well said: "The political complexion of Saint Martin is peculiar. Seventeen square miles of the northern section belong to France and the rest to Holland, while the settlers, largely blacks, are principally British, who outnumber both the Dutch and French. About 3,000 of the inhabitants are in the French portion of the island, and 5,000 in the Dutch" (Hill's 'Cuba and Porto Rico,' etc.); furthermore, "each maintains an administrative force as large as that of the State of Texas." The Dutch possessions — fragments on opposite sides of the Caribbean Sea — are the islands of Curaçao, Aruba, Bonaire or Buen Ayre, Saint Eustache, Saba and part of Saint Martin, as just stated. Venezuelan possessions are some of the islands, not appropriated by the English or Dutch, in the east-and-west line between Trinidad and the Gulf of Maracaibo. The list is completed by adding Cuba, a republic, subject in certain matters to the control of the United States; Porto Rico, with the small neighboring islands, a possession of the United States; and the Isle of Pines. Mr. Hill's observation in 1898 was that, "As we sail down the eastern islands, hardly a score in number . . . we find five foreign flags and no less than a dozen distinct colonial governments . . . with no shadow of federation between them, or even co-operation of any kind." For example, Dominica, though lying between Guadeloupe and Martinique, and within sight of both, is commercially farther from them than from England, because it is cut off from the French neighbors by tariff and quarantine laws.

Edwards, in his history of the British West Indies, says that the "state of the population" in the islands which he described in 1791 was as follows. Whites, 65,305, and blacks, 455,684.

The proportion of Caucasians has decreased owing to causes mentioned in the articles JAMAICA, etc. The principal attraction of these islands for immigrants from Great Britain and white residents (what there was left of it after the manumission of the slaves which was completed in 1838) ceased when the cane-sugar industry became unprofitable; an economic tendency which has so increased that between 1899 and 1903 loans or subventions amounting to more than \$4,600,000 have been provided by the British Parliament for the benefit of the dependent islands generally or specifically for the sugar producers. To speak of this as a new or temporary crisis is absurd: it is an old story. Anthony Trollope, when he wrote of 'The West Indies and the Spanish Main' in 1859, said: "That Jamaica was a land of wealth, rivaling the East in its means of riches, nay, exceeding it as a market for capital, as a place in which money might be turned; and that it now is a spot on the earth almost more poverty-stricken than any other — so much is known almost to all men." Now, such distress, long-endured and notorious, has more or less discouraged immigration, commerce, and other influences that make for uniformity in population, manners and usages. Mr. Hill's assertion that "each of these islands is breeding a different species of mankind" may seem at first view rather extravagant; but when we reflect that geography, politics and poverty combine to isolate and segregate those communities, we shall regard the following statements as decidedly moderate: "The West Indian people represent many original stocks, which have developed variations of habits and customs in their New World environment. They are practically divisible into three great races, the white, colored and black, modified by Spanish, English and French civilizations." The influence of the aboriginal stock should by no means be overlooked (see CARIB, PORTO RICO, CUBA, etc.), nor can we regard that of the Dutch and Danes as a negligible quantity. Mr. Hill writes "In the countries in which the French race habit has been implanted, Haiti, Martinique and Guadeloupe, there has resulted a more complete elimination of the Caucasian type than in either the English or (until 1898) Spanish islands. . . . The black races of the West Indies and their habits are most interesting studies. Gathered as they were from numerous tribes of Africa, and settled upon the different islands, they naturally show not only differences in inherited qualities, but in those habits acquired from different masters for which the African is noted. Thus there are English, French, Spanish, Irish, Scotch and Dutch negroes in the various islands." Again, differences in topography, soils, flora and climate, which, as we have said, require separate studies, have been summarized most intelligently by Mr. Hill, who writes: "These islands, far from being alike in natural features and economic possibilities, present great extremes. Some are low, flat rocks barely peeping above the sea; others gigantic peaks rising straight to the clouds, which perpetually envelop their summits; others are combinations of flat and rugged types. Some present every feature of relief configuration that can be found within a continental area — mountains, plains, valleys, lakes; some are made up entirely of glaring white coral sand or reef rock; others are entirely composed of black volcanic rock, and still others are a con-

WEST PITTSBURGH—WEST POINT

bination of many kinds of rocks. Many are as arid as a western desert and void of running streams, and others have a most fertile soil, cut by a hundred picturesque streams of living water, and bathed in perpetual mist and daily rainfall. Some are bordered only with the fringing salt-water plants or covered with thorny coriaceous vegetation; others are a tangled mass of palms, ferns and thousands of delicate, moisture-loving plants which overwhelm the beholder with their luxuriance and color. Some are without human inhabitants; others are among the most densely populated portions of the world" (for example, Barbados: 1,120 to the square mile). "The diverse configuration produces climatic differences, and each kind of rock weathers into its peculiar soil. . . . Some of these islands, through possibilities of a diversified agriculture and hygienic condition, are adapted to higher civilization, and others, either through sterility or ruggedness of relief, are capable of supporting only inferior races." The total number of inhabitants is approximately 5,100,000.

Finally, it is important to suggest modifications of an impression, created by publications which were widely circulated in 1903, to the effect that West Indians are all anxious to emigrate; that "every family has a son or daughter in the United States, or one saving up money with the idea of going there and making a fortune"; and that the threatened exodus from the archipelago is a new manifestation. The foregoing considerations make it clear that every sweeping generalization of this kind must be more or less misleading. And, further, we should realize that a similar phenomenon has been observed at short intervals during four centuries; that there has nearly always been a tendency toward exodus from some of the islands; that, for example, it was observed in the 16th century, when the treasures of Mexico and Peru were discovered, and the Spanish authorities found themselves fairly compelled to decree that every attempt to desert the island of Hispaniola (Santo Domingo) was an offense punishable with death. Discontent will undoubtedly continue until the archipelago as a whole regains a moderate degree of prosperity, and the inhabitants shall be free to move about among the islands, seeking employment or adventure wherever such things are offered.

Consult, beside the works already mentioned, the writings of Agassiz, Humboldt, Schomburgk, Froude, Fiske, and Mahan; for descriptions of scenery, etc., Kingsley and Hearn; for the old form of rivalry in regard to control in West Indian waters, the Earl of Leicester's personal narrative, 'The voyage of Robert Dudley, afterward styled Earl of Warwick and Leicester and Duke of Northumberland, to the West Indies in 1594-1595'; also Griffin, 'List of books, with references to periodicals on the Danish West Indies': Washington, 1901.

MARRION WILCOX,
Authority on Latin-America.

West Pittston, Pa., borough in Luzerne County; on the Susquehanna River, opposite Pittston. Two bridges span the river and connect the borough with the city. It is mainly a residential borough, many of the men who do business in Pittston have their homes in West Pittston. In 1900 (government census) West Pittston had 35 manufacturing establishments which were capitalized for \$567,287 and whose

output each year was valued at \$621,996. Pop. (1910) 6,848.

West Plains, Mo., city, county-seat of Howell County; on the Kansas City, Fort Scott & Memphis Railroad; about 125 miles south of Jefferson City. It is in a region where there are farming, fruit-growing, and lumbering interests. The city ships large quantities of apples, grapes, dairy and farm products, and lumber products. The two State banks have a combined capital of \$55,000. Pop. (1890) 2,091; (1900) 2,932; (1910) 3,200.

West Point, Ga., city in Troup County; on the Chattahoochee River, and on the Atlanta & W. P., and the Western of Alabama R.R.'s; about 85 miles southwest of Atlanta. It is in an agricultural region in which cotton is one of the chief products. It has cotton gins, cotton-seed-oil mills, cotton factories, an iron foundry, and a machine shop. It has one bank which has a capital of \$75,000. During part of the Civil War it was a supply depot for the Confederate army. Pop. (1910) 1,903.

West Point, Miss., town, county-seat of Clay County; on the Mobile & O., the Southern, and the Illinois C. R.R.'s; about 95 miles north of Meridian. It was founded in 1857. It is in an agricultural region in which cotton is one of the principal products. The chief industrial establishments are wagon and carriage factories, foundries, machine shops, brick and tile works, lumber mills, sash, door and blind factories, ice factory, milling and ginning establishment, and manufactories of electro-light dynamos. It has six churches, the West Point Military Academy, the Southern Female College, and elementary schools. There is a national bank which has a capital of \$75,000. Pop. (1890) 2,762; (1900) 3,193; (1910) 4,864.

West Point, Neb., town, county-seat of Cuming County; on the Elkhorn River, and on the Fremont, Elkhorn & Missouri Valley Railroad; about 36 miles northwest of Fremont and 75 miles northwest of Omaha. It is in an agricultural region, in which the chief products are wheat and corn. It has a flour mill, creamery, grain elevator, carriage and furniture factories, stock-yards, and coal and lumber yards. The two national banks have a combined capital of \$100,000, and the state bank has a capital of \$30,000. There are a high school and graded schools and a school library. Pop. (1910) 2,000.

West Point, N. Y., United States military post, Orange County; on the west bank of the Hudson River, on the New York, O & W., and the West Shore R.R.'s, and connected by ferry with the New York Central; 50 miles north of New York. It is also a stopping point for the Hudson River daily steamers. Its site is very picturesque, the eastern end of the point slopes abruptly to the river, on the northern side the slope is more gradual, to the northwest are Crow Nest and Storm King. The government reservation contains 2,330 acres, 2,100 of which were acquired in 1790. It was occupied as a military post by the Americans during the Revolution and was strongly fortified. A part of the fortifications consisted of a strong chain stretched across the river to Constitution Island to prevent British vessels ascending the river. It was for a time Wash-

WEST POINT—WEST VIRGINIA

ington's headquarters; and in 1780 was under the command of Benedict Arnold (q.v.) whose plan to betray it to the enemy was frustrated by the capture of André (q.v.). West Point was occupied as a military post after the Revolution, and a military school was established there as early as 1794; in 1802 the Military Academy was organized, and West Point designated as the site. See MILITARY ACADEMY, UNITED STATES.

West Point, or Eltham's Landing (Va.), Engagement at. When Yorktown (q.v.) was abandoned, 4 May 1862, it was intended by Gen. McClellan that Franklin's division, followed by Sedgwick's, Porter's, and Richardson's, should be moved in transports up York River to a place opposite West Point and, striking across to the main roads, cut off the retreat of such bodies of Gen. J. E. Johnston's army as might be below, making their way to New Kent Court House. But the day before the evacuation of Yorktown Franklin had received permission to land his men, who had been on the transports several days, and it was not until the morning of the 6th that he could get them on board again and ready to sail. About 1 p.m. that day he arrived at Eltham's Landing, above West Point, landed his men and sent the transports back for Sedgwick's division. He had no instructions except to wait for orders. The division was first encamped on a plain beyond which was high wooded ground, over which ran a road from the landing to Barhamsville and thence toward New Kent Court House. Franklin proceeded to occupy the wood. Newton's brigade was put in position on both sides of the road leading to Barhamsville. Parts of Taylor's and Slocum's brigades were on Newton's left; two batteries were in his rear, and two regiments of Taylor's brigade were in reserve. Next morning Dana's brigade of Sedgwick's division continued the left of the Union line back to the river. The presence of Franklin threatened the road through Barhamsville toward New Kent Court House, on which part of the Confederate army was retreating from Yorktown and Williamsburg, and under Gen. Johnston's orders Whiting's and Hampton's brigades had been put in position to protect the road. On the morning of the 7th, soon after Dana's brigade had come up, Whiting was ordered to advance and drive Franklin back to his landing-place. His skirmishers went forward and encountered those of Newton, and closely following came Hood's Texas brigade and Balthis' Virginia battery, supported on the right by two regiments of Wade Hampton's brigade. Newton's skirmishers were driven in and closely followed, then Newton threw forward two regiments, which were driven back, and the entire line was forced out of the wood. On Hood's right Whiting's brigade protected that flank, while on his left S. R. Anderson's Tennessee brigade had come up, and by noon Franklin had been pushed back under cover of the gunboats. The Confederates then attempted to shell the transports in York River, but the range was too great, while the fire from the Union gunboats was effective, and compelled the Confederates to withdraw about 3 p.m., and resume their position near Barhamsville. Franklin's troops resumed their former position. The Union loss was 48

killed, 110 wounded, and 28 missing; the Confederate loss, 8 killed and 40 wounded.

West Point Military Academy. See MILITARY ACADEMY, UNITED STATES.

West River, China. See SI-KIANG.

West Rutland, Vt., town in Rutland County; on Otter Creek, and on the Delaware & Hudson Railroad; about 55 miles southwest of Montpelier, the capital of the State. In 1887 it was set off from Rutland (q.v.) and organized as a separate town. The principal marble quarries, for which this region is famous, are in West Rutland. It has seven churches, graded schools, and a library. It is one with Rutland except in government. Pop. (1910) 3,427.

West Springfield, Mass., town in Hampden County; on the Connecticut River, and on the Boston & Albany Railroad; opposite Springfield. It was settled about 1655 and at first was a part of Springfield. In 1774 it was incorporated. It is mainly a residential town, many of the business men of Springfield have their homes here. There are several industrial establishments, chief of which are paper mills, railroad repair shops, and machine shops. Many of the people are interested in market gardening. The public library has about 8,000 volumes. Pop. (1910) 9,224.

West Troy, N. Y. See WATERVLIET, N. Y.

West Union, Iowa, city, county-seat of Fayette County; on the Chicago, M. & St. P. and on the Burlington, C. R. & N. R.R.'s; about 85 miles northwest of Dubuque. It is in an agricultural and stock-raising region. It has large creameries, flour mill, and stock-yards. There are three banks which have a combined capital of \$180,000 and (1903) deposits amounting to \$411,760. Pop. (1890) 6,676; (1900) 1,935; (1910) 1,652.

West Virginia, a state lying mainly on the western slope of the Appalachian Mountains; it was admitted to the Union 19 June 1863; area, 24,780 square miles, of which 135 square miles is water surface. The State lies between lat. 37° 6' and 40° 38' N. and lon. 0° 40' and 5° 35' W. from Washington. It is bounded on the north by Ohio, Pennsylvania and Maryland; on the east by Pennsylvania, Maryland and Virginia; on the south by Virginia and Kentucky; on the west by Kentucky and Ohio. The boundary is 1,170 miles in length and very irregular. Capital, Charleston, in Kanawha County.

Topography.—Though lying for the most part west of the Alleghany Mountains, West Virginia is not a geographic unity. With a general slope to the northwest, the surface of the State is broken into three great inclined planes, sloping from Spruce Mountain in Pendleton County to the east, to the north, and to the south. On the eastern and western sides there are broad valleys, which narrow into ravines as the upland hill region is approached. In the eastern part of the State are parallel ridges of mountain ranges, separated from each other by longitudinal and transverse valleys. The average elevation of West Virginia is greater than that of any other State east of the Mississippi River, being 1,500 feet; Pennsylvania is next with an average elevation of 1,100 feet. But in the alti-

WEST VIRGINIA

tude there is a vertical range of 4,600 feet, from 260 feet above the sea at Harper's Ferry to 4,860 feet at the top of Spruce Knob, in Pendleton County. The great range of altitude is equivalent in influence upon climate to a range of latitude of 15°, though the real range is 3.5°. Within the borders of the State, therefore, may be found the climate and products of South Carolina, Virginia, New England and Canada. In some parts of the State there has been frost in June; in Hampshire and Tucker counties are places where ice and frozen soil may be found all summer in the dense laurel thickets and spruce forests. The county of highest average elevation is Pocahontas; a very large area of the State lies above 2,000 feet; more than half lies above 1,500 feet, hence the principal industries of the higher regions are stock-raising, lumbering, and mining, since successful agriculture requires an elevation of less than 1,500 feet. The lowest depression west of the mountains is at Kenova, near the mouth of the Big Sandy River, 500 feet above the sea. Other elevations are: Bald Knob, Pocahontas County, 4,800 feet; High Knob, 4,710 feet, and Elkina, 1,922 feet, in Randolph County; Bayard, Grant County, 2,000 feet; Morgantown, Monongalia County, 901 feet; Parkersburg, on the Ohio River, 638 feet; Wheeling, in the Panhandle, 645 feet; Lewisburg, in Greenbrier County, 2,200 feet. The great range of altitude has many advantages: it gives abundant water power on all streams; it drains the mines of water and gas, and carries the coal from the mines, and stone from the quarries to the cars and to the boats—all by gravity. In this it has the advantage over the foreign coal fields and over all other American coal fields except those of Pennsylvania.

Climate and Rainfall.—West Virginia has perhaps the greatest diversity of climate of any State, caused by the numerous mountain ranges and the great variation in altitude. The country lying on the eastern slopes of the Alleghany Mountains has the warmer and drier climate. In the mountains a Canadian climate prevails both summer and winter. In the eastern and southern parts of the State are found sections where the winters are mild and the summers very warm. In the coldest regions the mercury sometimes falls to 30° below zero in winter, while in the warmest portions it sometimes rises to 96° above. In the northern part of the State at Morgantown the mean winter temperature ranges from 34° to 37°; the mean summer temperature, 70° to 75°. In the southern part of the State the average is 3° to 5° higher. The mean annual of the State is 54.4°. The date of the last killing frost in the northern part is about 15 April, of the first killing frost, about 15 October. The average yearly rainfall including melted snow is 44.2 inches. The average is greater on the western slope of the Alleghany than on the east, and greatest near the summit of the mountains. The rain clouds on the east come from the Atlantic; those on the west from the Pacific, modified by warm winds from the Gulf and cold ones from the northwest. The depth of the snowfall varies greatly with locality and altitude, from a few inches in the warmer regions to six or seven feet near the tops of the mountains.

River System.—The Alleghany watershed is in the eastern portion of the State, all except

eight of the counties lying on the western slope within the Ohio Basin. In the higher part of the State, where Pendleton, Pocahontas, and Randolph counties join, five rivers rise which flow across the State—two finally flowing eastward into the Atlantic, and three westward into the Ohio. The Ohio forms the western boundary and is navigable throughout its length. The eastern part of the State is drained by the Potomac and its tributaries. The Cheat and Monongahela flow through the northern counties, and the latter is now navigable as high up as Fairmont in Marion County. The Greenbrier and the Elk flow from the watershed to the southwest and join the Great Kanawha, which flows northwest into the Ohio. The Great Kanawha is navigable for 90 miles from the Ohio. The Big Sandy, flowing northwest, forms the southern boundary of the State. The river system of the State has been improved somewhat for navigation by the government engineers, but the interior rivers will always be more valuable for their water power than for facilities of navigation.

Geology, Mineral Resources, and Mining.—Beginning in the east with the oldest and lowest rocks, the first formation of importance is the Shenandoah or Trenton limestone, extending across Jefferson County and the eastern part of Berkeley County. It stands at an angle of 30° to 35°, is several thousand feet thick, produces a valuable commercial lime, and underlies the best farm lands of the State. In this region are the cities of Charles Town, Shepherdstown, and Martinsburg. The next important formation to the west is the indestructible Medina sandstone, a great mountain maker. It is seen in Mineral and Pendleton counties. Above the Medina sandstone is the Lewiston or Helderberg limestone in Mineral, Hampshire, Hardy, Grant and Pendleton counties. This limestone is valuable for cement and for fertilizing purposes. Resting upon this is the Monterey or Oriskany sandstone, a coarse, friable rock, producing after disintegration a barren soil. It is seen in Mineral and Morgan counties and as far south as Pocahontas. From it is obtained glass sand and material for silica brick. Next above to the west are the Hamilton shales in Randolph, Pocahontas, Greenbrier and Monroe counties. This is the region of the mineral springs, and summer resorts. The mountain limestone begins in Monongalia County, a thin, narrow formation, and thickens and widens toward the southern part of the State. The last formation of importance before the carboniferous measures is the Great Conglomerate or Millstone Grit, extending across the centre of the State. The western two thirds of the State is formed principally of coal measures made up of alternating layers of shales, sandstones, fire-clays and coal seams. Thus there are in the State three limestones of value, and three sandstones. Peat is forming in the shady swamps of the cold uplands of Preston, Tucker, Grant and Randolph counties.

West Virginia has no gold, silver, or other of the valuable metals, but is rich in the common minerals. Of these coal is the most important. The Appalachian coal fields, extending from northern Pennsylvania to western Alabama, extend from the north to the southwest through the entire length of the State, and here the coal fields are at the broadest extent, the average

WEST VIRGINIA

width being about 100 miles and the average length 150 miles, thus giving about 15,000 square miles of coal lands, of which 10,000 to 12,000 will be productive. There are three distinct parallel areas of distribution of coal deposits. (1) the New River—Pocahontas coal in the southwestern part of the State, extending from Randolph County southwest to McDowell County, and underlying ten counties; (2) the Alleghany-Kanawha coal measures underlying 17 counties and extending across the State through the central part from Preston County to Mingo, gradually widening toward the southwest; (3) the Pittsburgh coal is found in the northwestern part of the State from Braxton County to Monongalia and Hancock counties, underlying 15 counties. In the extreme northeast, in Morgan and Berkeley counties, some anthracite coal is found, but it is not profitable for mining. At present coal mining is carried on in four principal districts, two in the north and two in the southern part: (1) Fairmont or Upper Monongalia district, which produced in 1909 10,458,132 short tons, and to which the Baltimore & Ohio railroad furnishes transportation; (2) the Elk Garden or Upper Potomac district, opened by the Baltimore & Ohio and the West Virginia Central and Pittsburgh railroads, which produced 2,240,573 short tons in 1909; (3) the Pocahontas or Flat Top district in the southeast, on the Norfolk & Western railroad, producing in 1909, 19,639,106 short tons; (4) the New and Kanawha rivers district, producing in 1909, 18,521,107 short tons of coal, which was sent to market over the Chesapeake & Ohio railroad and the Kanawha River. The coal production in 1880 was 1,568,000 tons; in 1890, 7,391,654 tons in 1900, 22,647,207 tons, in 1909, 51,849,220 tons. West Virginia is second only to Pennsylvania in the coal production. In 1903 there were 479 coal mines in operation in 26 counties, as follows: Fayette, 104; McDowell, 5; Marion, 24; Kanawha, 85; Harrison, 45; Tucker, 8; Mercer, 13; Mineral, 10; Mingo, 35; Preston, 18; Taylor, 10; Barbour, 13; Putnam, 4; Marshall, 5; Ohio, 6; Randolph, 7; Raleigh, 16; Mason, 10; Monongalia, 6; Hancock, 4; and Brooke, 7. Five other counties have from one to five mines each. About ten counties not in the above list produce small quantities of coal. West Virginia coal is especially good for cooking purposes, and in nine counties—McDowell, Fayette and Tucker leading—are large coking establishments. In 1909, 3,943,948 tons of coke were produced, valued at \$7,525,922. In 1901, 403 electrical machines were used in coal mines, reducing labor to the equivalent of 4,817,943 tons. The average wage of a miner is \$52 per month. It is a significant fact that the amount of coal consumed within the State, excluding that used by transportation agencies, is very small, most of it being shipped from the State. Manufactures are not sufficiently developed to use large quantities of coal, and besides natural gas is used instead of coal in many establishments, and most of the railway companies are connected with the mining interests and encourage the long freight hauls. Metallic ores are not found in paying quantities. The value of the stone, principally limestone and sandstone, quarried in the State in 1909, was \$1,065,205; the value of the salt produced—150,412 barrels—was \$76,463. Valuable deposits of lime are found in Jefferson, Berkeley, Hampshire, Hardy, Greenbrier and

Monroe counties. Numerous mineral springs, well known as health and pleasure resorts, are found in Greenbrier, Monroe, Summers and Hampshire counties. The State owns Berkeley Springs in Morgan County, and Capon Springs in Hampshire County, through the bequest of Lord Fairfax, who left them to the people of Virginia forever.

Oil and Gas.—Both petroleum and natural gas are found in immense quantities in the northwestern section of the State. The development of both is drifting toward the Kanawha Valley. The counties producing the greater part of the oil and gas are Ritchie, Wood, Wirt, Gilmer, Roane, Kanawha, Cabell, Lewis, Pleasants, Doddridge, Harrison, Tyler, Marion, Wetzel, Monongalia, Marshall and Hancock. The gas produced in 1901 was worth \$3,954,722, in 1902, \$5,300,181. It is conveyed by pipe lines to the principal cities of the State, to Cleveland, Pittsburgh, and to other cities in adjoining States. In the production of crude petroleum West Virginia now ranks fourth of the States, producing in 1910, 22,000,000 barrels, valued at about \$25,000,000. Most of the oil is piped to Philadelphia and Baltimore.

Agriculture, Horticulture, and Stock Raising.—The total value of farm property in West Virginia in 1910 was \$262,458,000, which amount represents the land and buildings of the State's farms, \$56,848,000, the value of the buildings, and \$205,610,000, the value of the land and other improvements, farm implements and machinery were worth \$6,962,000.

The value of the farm products (1910) was \$44,768,979, of which amount animal products were worth \$19,073,790, and crops, \$25,696,189—more than twice the valuation in 1890. The gross farm income was \$36,608,119, the net income cannot be ascertained. The total land area is 15,772,800 acres, of which 9,061,000 are in farms. From the northeast corner of the State extending south and southwest to the Big Sandy River the country is mountainous with narrow valleys. There are no transportation soils, all being from disintegration of limestone, sandstone, or mixtures of shales and clays. The soil is generally fertile and does not wash into gullies, and the land is productive to the tops of the mountains. Clay soil is found in some of the higher portions, alluvial soil in the upland valleys, and unproductive sandy soil in the northeast. In the extreme northeastern counties the soil is of rich limestone. West of the mountains the broad flat hills furnish grazing for cattle, while the valleys produce good crops. The surface near the Ohio River is gently rolling and the soil—clay and sand loams—is rich. The average size of the farms is gradually decreasing and now ranges from 72 acres in Clay County to 305 in Hardy, the general average being 115, and the average value being \$1,446. The largest farms are found in the grain and stock-raising counties. White farmers (92,132) conduct 99.2 per cent of the farms, and 77 per cent of them own in whole or part the land they cultivate; 72 per cent of the colored farmers own in whole or part the land they cultivate. The average value of the negro farm is about half that of the white, and the average gross income about half as much. There are only 614 farms of 1,000 acres and over, most of them ranging from 50 to 90 acres.

On most of the farms the principal source of

WEST VIRGINIA

income was from stock-raising; hay and grain furnished the next most important source. Of live stock, horses, cattle, sheep, hogs, poultry and mules were valued in the order named. The value of animals sold and slaughtered was \$9,428,066; dairy products, \$5,088,153; poultry and eggs, \$3,721,427; wool, \$636,012. The principal crops and their values in 1910 were corn, \$16,266,000; hay and forage, \$12,150,000; wheat \$5,228,000; buckwheat, \$443,000; oats, \$1,260,000; potatoes, \$2,527,000; tobacco, \$1,318,400. The largest corn growing counties are Wayne, Kanawha, Jackson, and Mason, in the Kanawha Valley; Jefferson, Berkeley and Mason lead in the production of wheat; Hampshire, Hardy and Morgan in rye; and Preston in oats and buckwheat. Orchard fruits, principally apples, peaches, cherries, pears, plums and prunes are raised in Randolph and Mineral counties. The largest orchard in the Middle West is in Randolph County, containing 1,740 acres and 200,000 trees. Small fruits (berries) are raised in Brooke, Harrison, Ohio, and Wood counties; tobacco in Lincoln, Putnam and Cabell counties. The average expenditure on each farm for labor is \$22, which shows that the West Virginia farmer does most of his own work. The amount expended for fertilizers is very small, only \$4 per farm. The United States Agricultural Experiment Station is located at Morgantown and is conducted by the State University.

Timber.—There are 15,000 square miles of timber lands in the State, about 74 per cent of the total area. The largest hardwood mills in the world are in Pocahontas, McDowell and Randolph counties. The production in 1903 was: poplar, 180,000,000 feet; spruce, 75,000,000 feet; oak, 50,000,000 feet. There are large forests of white pine in the upland regions which have not been touched by the lumberman. The densest forests are in the eastern and southern counties. The principal trees of value found in the State are oak, both red and white, and chestnut, hickory, locust, maple, poplar, birch, hemlock, white pine, and spruce. The lumbering industry is rapidly increasing in importance as the interior of the State is opened up by railroads.

Manufactures.—In 1900 there were in West Virginia 2,586 manufacturing establishments, with a total capital of \$150,923,000, employing 68,864 persons. The total wages paid amounted to \$38,710,000, and the gross value of the products was \$161,060,000. Manufactures are located principally in the northern part of the State and along the Ohio River, which forms the western boundary. The 12 counties along the river furnish 59 per cent of the manufactures; the four Panhandle counties alone furnish 44 per cent. The localization of the manufactures is due to the shipping facilities offered by the Ohio River and to the local supply of natural gas and coal. About 31 per cent of the manufactures are found in the six cities of Wheeling, Parkersburg, Martinsburg, Huntington, Charleston and Benwood. The following are the most important manufacturing counties, each producing over a million dollars' worth: Ohio, Marshall, Wood, Kanawha, Cabell, Tucker, McDowell, Berkeley, Fayette, Randolph, Marion, Morgan, Mineral, Jefferson, and Grant. The manufacture of iron and steel is the most important of the manufacturing industries.—11 establishments employing 4,467 men, with an output valued at

\$16,514,212. The iron and steel industry is at present confined to Wheeling and vicinity and Parkersburg. The next important industry is the manufacture of lumber products, with 950 establishments, 5,327 wage-earners, and products valued at \$10,612,837. The industry third in rank is flour and grist milling, with 737 mills, 314 employees, and products worth \$5,541,353. West Virginia ranks next to Pennsylvania in the amount of coke produced. In 1900 there were 77 coke producing plants, with 3,131 employees and products valued at \$3,529,341. The United States Steel Corporation is erecting one of the largest plants in the world near Welch in McDowell county. When finished it will employ 10,000 men, and will have the largest coke producing plant outside of Pennsylvania. The leather industry employs 664 men in 46 establishments, and the products are valued at \$3,210,753. The oak and hemlock forests near at hand furnish an abundant supply of tanbark. The largest production of leather is in the eastern and northern counties. Glass manufacture is a rapidly growing industry, having 16 factories in 1900 with an output valued at \$1,871,895, and has quadrupled since that time. In the census reports for 1900 about 100 other industries are listed. All manufactures are rapidly expanding, especially the production of glass, steel, and coke. From 1890 to 1900 the value of manufactured products increased 117 per cent; from 1900 to 1903 it is estimated that there has been a further increase of 40 per cent.

Railroads.—There are more than 3,500 miles of railway in operation in the State. The principal lines are the Baltimore & Ohio, extending across the northern part of the State, besides numerous important branches covering most of the western part of the State; the Chesapeake & Ohio, crossing the southern part of the State along the Kanawha Valley from White Sulphur Springs to Kenova; and the Norfolk & Western, with four branch lines along the Big Sandy Valley in the southern part of the State from Wills to Kenova. The Wabash has surveyed a route and will build a road across the State from north to south. Other shorter railroads are: The West Virginia Central & Pittsburg, with main line from Cumberland to Harding, and five branch lines; the Kanawha & Michigan, the Pittsburg, Wheeling & Kentucky, the Dry Forks Railway, the Guyandotte Valley, the Charleston, Clendinning and Sutton, and several other short lines, besides a number of completed and partial surveys. About 1,500 miles of new road were being surveyed or were in process of construction in 1904. The Baltimore & Ohio and the Chesapeake & Ohio lines have in recent years absorbed numerous short lines within the State. The great production of coal, coke and lumber demanding transportation encourages the rapid development of the railroads.

Finances.—The State has no debt, having refused to assume any of the debt of Virginia; the tax rate is 25 cents on \$100 for State purposes and 10 cents for school purposes. The receipts for the year ending 30 Sept. 1902 amounted to \$2,348,987.89. The disbursements were \$2,292,533.86. The State had in stocks and bonds and investments \$650,336.44. The unused funds of the State are deposited with 63 state banks and draw 3 per cent interest. The chief sources of income in 1902 were: licenses, \$324,321; corporation license tax, \$399,845; railroad taxes

WEST VIRGINIA

\$201,321.43; interest on deposits and securities, \$72,675; fines, etc., \$29,324.42; poll taxes, \$163,415.75; land tax, \$298,875.25; buildings on land, \$45,254.20; lots, \$42,109.50; buildings on lots, \$89,340.54; intangible personal property, \$140,290.15; tangible personal property, \$75,890.90.

Banks and Banking.—In November 1909 there were 82 State banks in West Virginia, a large decrease in recent years; 88 national banks, an increase of 20 over the year 1903; no private banks and ten savings banks. In 1893 there were only 55 State banks. The State banks had in 1903 a paid up capital stock of \$7,731,510, an increase within the year of more than two and a half millions. The deposits in the state banks for 1902 amounted to \$32,872,669.70, and for 1903, to \$38,908,768.65; the total resources for 1902 amounted to \$42,735,099.93; and for 1903 to \$53,481,750.14. In November 1903 the national banks had a paid up capital of \$5,528,500, a million more than in 1902. In 1902 the deposits in the national banks were \$21,854,404.45; in 1903, they were \$23,349,827.21. The total resources of the national banks amounted in 1902 to \$33,751,891.50, and in 1903 to \$37,623,030.27, exclusive of United States deposits amounting to \$1,298,521.28. The one savings bank in the State is located at Wheeling, but the savings feature is popular with many banks, and savings deposits amounted in 1903 to \$4,500,000. The State legislature is forbidden to grant charters to banks, but has passed general laws under which the secretary of state grants charters to banks that have complied with the legal requirements. In order to obtain a charter a bank must have a capital of not less than \$25,000 and not more than \$500,000. Ten per cent of the capital must be paid in before the charter is granted, and 40 per cent must be paid in before the bank can open. A State commissioner of banking inspects each state bank once or more each year, but does not inspect national banks. It is his duty to see that the books and records are properly kept, and that the public is protected against loss from failure of a state bank. He has authority to call for books and papers and to require that his directions be followed. When he thinks it necessary he may, with the advice of the attorney general and the consent of the governor, petition the courts for a receiver to close up the affairs of a failing bank.

Education.—The educational system of West Virginia is rapidly becoming more efficient, and now compares favorably with those of the surrounding States. In 1902 the expenditure for public education was \$2,583,533.64, or \$2.69 per capita of the total population, an annual expenditure of \$14.18 per pupil. Out of 315,810 children of school age, 236,015 were enrolled in 6,001 schools for whites and 297 schools for negroes, under 7,098 white teachers and 278 negro teachers. By law the races must be kept separate in all schools. There are 6,021 school houses owned by the State. The average length of the school term is six months, and the average pay of teachers, \$32.04 per month, or \$189.03 per year. At Morgantown, Keyser and Montgomery are preparatory schools with an enrolment of 400, affiliated with the State University. For secondary and higher education there are six normal schools for whites enrolling about 2,000 stu-

dents at Huntington, Fairmont, Athens, West Liberty, Glenville and Sheperdstown, and three for blacks at Bluefield, Harper's Ferry, and at Institute in Kanawha County; the West Virginia University at Morgantown; Bethany College at Wheeling; West Virginia Wesleyan University at Buckhannon; Salem College; Broaddus Institute at Clarksburg; Lewisburg Female Institute; Morris Harvey College at Barboursville; Linsley Institute; Alleghany Collegiate Institute; private academies at Romney, Princeton, Alderson, Elkins, Burnsville, and in the larger cities; Business Colleges at Wheeling, Parkersburg, Clarksburg, and Charleston. The Roman Catholic Church has schools at Wheeling, Parkersburg, Clarksburg, Grafton, Huntington, Benwood, Charleston and Fairmont. In 1900 there were 89,105 illiterates over 10 years of age, 64,281 of whom were native whites, 4,730 were foreign born, and 11,094 were colored. Of the foreign born, 3,648 could not speak English.

The West Virginia Historical and Antiquarian Society was founded in Charleston in 1891, and the Trans-Alleghany Historical Society at Morgantown in 1901. The State Educational Association was organized in 1869. Each of the above associations publishes a periodical. There is a fine State museum at Charleston, administered by the Historical and Antiquarian Society.

Libraries.—In 1902 there were 1,082 school libraries with a total of 37,495 volumes. In 1900 the Bureau of Education reports 23 larger libraries in West Virginia with a total of 100,492 volumes. There are few large libraries, most of them having less than 5,000 volumes. Those of more than that number are the Wheeling Public Library, the State Library at Charleston, West Virginia University, the West Virginia Historical and Antiquarian Society, Storer College (colored), and the West Virginia Conference Seminary. In none of the libraries are there more than 25,000 volumes.

Charitable and Reformatory Institutions.—There are two hospitals for the insane at Weston and Spencer with 1,629 patients in 1900; an Industrial Home for Girls at Salem with 50 inmates; the Deaf, Dumb and Blind School at Romney with 209 inmates; the Reform School for Boys at Pruntyton, with 268 inmates; an Asylum for Incurables at Huntington; Miners' Hospitals at Welch, McKendree and Fairmont; and the State penitentiary at Moundsville. There were in 1902, 990 convicts in the penitentiary, of whom 450 are whites and 540 are negroes; the latter, though forming only one twentieth of the population, furnish more than half the criminals. The prison is more than self-supporting. The Episcopal Church maintains a miners' hospital at Paint Creek, in Kanawha County, and the Reynolds Memorial Hospital near Moundsville. The West Virginia Humane Society cares for aged people, children, and animals. It is controlled by a board consisting of one member from each congressional district, appointed by the governor.

Churches.—The churches in West Virginia in order of membership are: Methodist Episcopal; Baptist (North); Methodist Episcopal (South); Roman Catholic; United Brethren; Methodist Protestant; Presbyterian, in the U. S.; Disciples; Presbyterian, in the U. S. A.; Colored Baptists, Regular; Protestant Episcopal; Free-

WEST VIRGINIA.

WEST VIRGINIA

will Baptists; Lutheran, United Synod, South; Lutheran, General Synod; Baptist (South). In 1903 there were 2,024 Sunday schools in the State, with 20,545 officers and teachers and 152,955 scholars.

Population.—The population of the territory now embraced in West Virginia was 55,873 in 1790, 376,688 in 1860, 442,014 in 1870; 618,457 in 1880; 762,794 in 1890; and 958,800 in 1900. The largest city in the State is Wheeling in the Panhandle, with a population of 41,461; the other principal cities and their populations are Huntington with 31,161, Parkersburg, 17,842; Charleston, 22,996; Martinsburg, 10,698; Fairmont, 9,711; Grafton, 7,563; Moundsville, 8,918. There are 14 towns with populations ranging between 2,000 and 5,000, and 13 from 1,000 to 2,000. Of the entire population 499,242 are males and 459,558 are females, the native born number 936,349 (of whom 892,854 are white) and the foreign born 22,451, the total number of whites is 915,223, of colored, 43,567, of whom 43,499 are negroes, 56 Chinese, and 12 Indians. The foreign population is found principally in Marion, Marshall, Ohio, Tucker and Wood counties,—in the mining districts and in the cities. Among the foreigners the Germans lead with 6,537; there are 3,342 Irish, 2,921 Italians, 2,622 English and Scotch, 1,025 Magyars and Slavs, and about 600 each of Canadians, Swiss, Welsh, and Poles. The negroes are found principally in the counties of Berkeley, Cabell, Fayette, Greenbrier, Harrison, Jefferson, Kanawha, McDowell, Mineral, Ohio, and Summers. There are three distinct classes of the black population: those in the cities, the agricultural negroes, and the miners. No cities have large negro populations, Wheeling and Clarksburg having each about 1,000 and Charleston 1,700. In no county does the black population outnumber the white. The principal immigration into West Virginia, excluding foreigners, has been from New York, 2,945; North Carolina, 3,964; Ohio, 40,301; Pennsylvania, 28,927; Virginia, 61,508. Native West Virginians now living in other States are distributed as follows: in Illinois, 5,882, Indian Territory, 4,698; Iowa, 3,992; Kansas, 6,566; Kentucky, 4,383; Maryland, 9,694; Missouri, 6,153; Ohio, 30,324; Pennsylvania, 19,329; Virginia, 7,162. There are 247,979 males of voting age, of whom 14,786 are negroes. Of the white voters 23,577 or 11 per cent are illiterate, of the black voters, 5,583 or 38 per cent are illiterate. There are 186,201 families in the State, of whom 183,780 are private families; 98,469 families own their homes, and 80,799 rent homes; 94,445 families live on farms, and 70,940 own farm homes, 92,216 native whites own homes, 68,984 being farm homes; 4,269 foreign families live in their own homes, and 1,983 negro families own their homes. Pop. (1910) 1,221,119.

Militia and National Guard.—There are 200,508 males of militia age. The organized portion of the militia is known as the West Virginia National Guard, and numbered in 1904, 1,545 men. There is a brigade of two regiments under the command of a brigadier-general who has a full brigade staff. The governor is commander-in-chief and appoints the general staff. The law provides for the organization of a battery of artillery, a signal corps, and a medical department. The organized militia is supported

by appropriations from the United States and the State governments. Arms, uniforms, and equipment, and armories are provided. The national guard is subject to ten days' camp duty per year and is paid for that time.

Government.—The governor, auditor, treasurer, secretary of state, attorney-general, and superintendent of Free Schools, constitute the executive of West Virginia. All the officials above named except the attorney-general are obliged to reside at the capital. All are elected every four years. Each of the above officials reports in writing to the governor ten days before the meeting of the legislature. The governor must have resided in the State five years and must be at least 30 years of age. In case of a vacancy in the governorship within the first three years after election a new election is held. If the remainder of the term is less than one year the president of the senate acts as governor, and after him the speaker of the house is eligible. The salaries paid have been after 1904 as follows: governor \$5,000; secretary of state, \$4,000, in addition to fees amounting to about \$15,000, superintendent of free schools, \$3,000, treasurer, \$2,500; auditor, \$1,500 and fees, amounting to about \$20,000, the attorney-general, \$2,500 and fees. The auditor is not only comptroller of the currency but is also register of the land office and commissioner of insurance. Other State officials are the State librarian, the adjutant-general, the commissioner of banking, the State geologist, the secretary of the board of agriculture, the commissioner of labor, the five mine inspectors, the game and fish warden, and there are the following boards and bureaus: Geological Survey, State Board of Examiners for Teachers, State Board of Agriculture, Board of Dental Examiners, State Board of Health, the State Board of Embalmers, and the Board of Public Works which is composed of the governor, auditor, treasurer, superintendent of schools, attorney-general, and the secretary of state. This board cares for the interests of the State in matters relating to internal improvements. The elections for State officials are held at the time of the presidential election and the new officials take office on 4 March of the next year. The legislature meets biennially in January of the odd numbered years and may remain in session not more than 45 days. Half of the senators are elected every two years, and all of the members of the House of Delegates. There are 15 senatorial districts, each sending two senators to Charleston. A senator must be at least 25 years of age, but only voting qualifications are required of a delegate. The pay is \$4 per diem and mileage. Of the 30 senators, 25 are Republicans, and of the 86 delegates, 59 are Republicans, a majority on joint ballot of 30 for the Republicans. There is no pocket veto and a simple majority suffices to override the governor's veto; after five days a bill may become a law without his approval. The legislature is prohibited from anything except general legislation. The State is divided into five congressional districts, which are all represented in Congress by Republicans, and both senators are Republicans. The judiciary is composed of (1) the supreme court of appeals; (2) 18 circuit courts; (3) 8 courts of limited jurisdiction; (4) the courts of county commissioners; (5) justices of the peace; (6) city courts.

WEST VIRGINIA

The supreme court is composed of 5 judges elected for 12 years, and holds session once a year at Charleston, Wheeling, and Charles Town. The judges are paid \$4,500 and mileage. There are 18 circuit judges for 18 circuit courts; they are paid \$3,300 and mileage. A circuit court is held four times a year in each county. The constitution prohibits any change in the judicial system oftener than once in eight years. The rapid development of some parts of the State rendered more courts necessary, so the legislature created nine (now eight) courts of limited jurisdiction with appeal to the circuit courts. Each county is divided into from three to ten magisterial districts, and each district elects one justice of the peace, or two if the population is greater than 1,200. These justices have the usual powers of American justices of the peace, and jurisdiction over civil suits involving \$300 or less. The county court is not a common law court, and not a court of record, but rather an administrative board for county affairs. There are no chancery courts, but the courts of record have equity jurisdiction; in equity cases the trial court may appoint four commissioners in chancery who decide such questions as the court refers to them and upon their decisions and reports the judge bases his decrees. Notaries public and commissioners are appointed by the governor without limit as to number. The unit of local government is the county under the usual elective county officers: county commissioners, sheriff, clerk, tax assessor, surveyor, etc. The township system was adopted in 1863 but did not work satisfactorily, and in 1872 was abolished and the old county system revived. Each county is divided into magisterial districts corresponding to the beat, precinct, or township of the southwestern States. No State official may accept a pass from a railroad company for himself or family.

History and Politics—The region now embraced in West Virginia was first explored by Abraham Wood in 1671. Governor Spotswood came over the mountains in 1716, and to celebrate the crossing his party drank 11 different kinds of wine in what is now Pendleton County, and in 1725 John Van Meter explored the valley of the South Branch. In 1727 Morgan Morgan built the first cabin in what is now Berkeley County. After 1735 the South Branch Valley began to fill up with the overflow from the Shenandoah Valley and from Pennsylvania and Maryland. The settlers were of several nationalities—and the composition of the people of West Virginia has always been different from that of the country east of the mountains. Some of the land in West Virginia was embraced in the "Northern Neck" grant to Lord Fairfax, and his surveyors in 1746 planted the Fairfax stone at the head of the North Branch of the Potomac to mark the western limits of the grant. In 1768, after the expulsion of the French who claimed the territory drained by the Ohio, the Six Nations sold the land to the English, though several other Indian tribes claimed the country. But within historic times no Indians have ever occupied any part of West Virginia. The attempts of the whites to take possession of these Indian lands led to bloody conflicts that lasted until after the Revolution. The West Virginians heartily supported the Revolution and

sent troops to help New England and the Middle Colonies. The history of western Virginia before 1861 is a history of controversy with eastern Virginia. Socially, politically and economically, the two sections of the State were unlike from the first. Western Virginia was democratic; eastern Virginia was aristocratic, in institutions. The idea of separation was older than the Union, the Continental Congress had been petitioned to set up a State west of the Alleghenies; the people of the West were always ready for independence. The western counties complained that they were governed for the benefit of the eastern counties. Unlike Tennessee and Kentucky, western Virginia had to wait half a century for separate State existence. The crisis came during the secession movement in 1861. The Virginia convention passed the ordinance of secession, the delegates from the western counties opposing, and submitted it to the people. From November 1860 to May 1861 meetings were held in the western counties which made it clear that that section would not go with the South. An irregular convention of 26 counties met in Wheeling, 13 May 1861, and came near breaking away before the vote on the ordinance of secession. The western counties voted 40,000 against and 4,000 for secession. The second Wheeling convention composed of the newly elected members of the legislature and irregularly elected delegates from the counties west of the mountains, met 11 June, declared the ordinance of secession void, vacated the offices of the State of Virginia, and formed a "reorganized" government of Virginia. The legislature, calling itself the Virginia legislature, elected senators for Virginia who were received at Washington. The convention made a provision for organizing a new State by calling a third convention at Wheeling on 26 November, in which 41 counties were represented. A constitution for the new State was formed and ratified by the people in April 1862. It was at first proposed to call the new State Kanawha, but the name West Virginia was finally adopted. The "Reorganized" government of "Virginia" gave its consent to the erection of the new State, and on 31 Dec. 1862, Congress consented to admit West Virginia to the Union as soon as it should provide for gradual abolition of slavery. On 19 June 1863, the State was admitted to the Union, and the long desired separation was effected. The movement was not caused by the war; the war simply gave an opportunity to secure long-desired independence. During the Civil War no important military operations were carried on in West Virginia. The Confederates early lost control of the State, but there were skirmishes and raids until near the end of the war. However, as compared with the other Southern States, West Virginia suffered little. From the State about 29,000 soldiers entered the Union army, and about 10,000 went into the Confederate. Laws were passed by the legislature confiscating the property of Confederates, and after the war all Confederates and Confederate sympathizers were disfranchised from voting and holding office. In 1869 it was officially reported that 29,316 persons,—nearly half of the voting population—were disfranchised. In the reaction against the Fourteenth Amendment, the Flick Amendment to the State Constitution, which combined white enfranchisement

WEST VIRGINIA CAMPAIGN OF 1861

with negro suffrage, was adopted. But before its adoption in 1871 the Democrats carried the State. Thus the liberal measures were proposed by the Republicans. The Democrats retained control of the State until 1897 when the Republicans carried the elections. The change in political complexion was due to the great industrial development of the State which attracted a heavy immigration from the States to the north and west. West Virginia was the first State to begin the undoing of reconstruction; and the first to break from the ranks of the "Solid South."

WALTER L. FLEMING,
Prof. of History, Louisiana State University.

West Virginia Campaign of 1861. At the outbreak of the Rebellion West Virginia had few slaves, no sympathy with the secession movement, and adhered to the Union. Her citizens denounced the action of the State convention in adopting an ordinance of secession, and at town and county meetings passed resolutions looking to a separation of the western counties from the rest and the organization of a new State. On 13 May 1861 a delegate convention was held at Wheeling, 26 counties being represented by nearly 400 leading Union men, and an interchange of views resulted in a decision to secede from the State should the ordinance of secession be ratified by the vote of the people to be given on the 23d of May, and a provisional convention was called to meet on 11 June following. The vote cast on 23 May was large and showed a majority against secession in the west. Out of a vote of about 44,000 in 50 counties 40,000 were against the ordinance of secession.

Meanwhile Gov. Letcher had called out the militia of West Virginia and ordered officers to protect the Baltimore & Ohio Railroad and guard the frontier of the State against invasion by Ohio and Pennsylvania. The principal officer assigned to this duty was Col. Geo. A. Porterfield, who, 4 May, was ordered by Gen. R. E. Lee to Grafton to call out the militia and enroll volunteers to protect the railroad and encourage secession sentiment. Five thousand men were thought ample for the purpose, but Porterfield could not raise a tenth of that number and troops had to be sent from the eastern part of the State. Gen. Lee had informed Porterfield that it was not intended to interfere with the peaceful use of the railroad, but Gov. Letcher, incensed at the overwhelming Union sentiment and the apathy of the citizens in volunteering, and moved also by the collection of Ohio troops on the border, ordered Porterfield to make a

descent on Wheeling, seize and carry away the arms sent there by the national government, and arm his men with them, and specially commanded that should troops of Ohio or Pennsylvania endeavor to pass over the railroad to destroy it and the bridges. To seize Wheeling was impossible with the few men at his disposal, but, convinced that the Ohio troops were on the eve of a movement eastward, Porterfield burned the bridges of the railroad between Farmington and Mannington. This action was immediately followed by the occupation of the railroad and contiguous country by loyal West Virginia, Ohio, and Indiana troops, under command of Gen. McClellan, who had been assigned to the command of a military department embracing Ohio, Indiana, Illinois and West Virginia. Upon the advance of these troops from Wheeling and Parkersburg on the 27th, Porterfield abandoned Grafton on the 28th and fell back to Philippi, from which place he was driven on 3 June to Beverly. (See PHILIPPI, ENGAGEMENT AT.) Gen. Garnett was sent to relieve Porterfield and took position at Rich Mountain and Laurel Hill. Col. John Pegram's detachment at Rich Mountain was attacked and defeated by McClellan, 11 July, many men were taken prisoners and the rest retreated over Cheat Mountain. McClellan pursued through Beverly and Huttonsville, seized the summit of Cheat Mountain and intrenched a part of his command on the main Staunton turnpike leading over the mountain. (See RICH MOUNTAIN, BATTLE OF.) Garnett, who was at Laurel Hill, abandoned his position on the night of the 11th and retreated northeast toward the Northwestern turnpike, was overtaken at Carrick's Ford, on Cheat River, on the 13th, was killed, and his command, making a rapid retreat reached the Northwestern turnpike and turning southward arrived at Monterey in a demoralized condition. There are but three routes across the mountains separating West Virginia from the Shenandoah Valley that are practicable for military operations: the Northwestern turnpike on the north; the Staunton and Parkersburg turnpike farther south, and the Kanawha turnpike leading past Gauley Bridge, still farther south. While McClellan was seizing the two first, a column under Gen. Cox was operating on the latter. At the time Gen. Garnett was sent to Rich Mountain, Gen. H. A. Wise was ordered to raise a force for the defense of the Kanawha Valley, and Gen. J. B. Floyd was directed to raise a brigade for service in southwestern Virginia. It had been McClellan's intention to conduct his campaign in West Virginia by way of the Kanawha Valley, but the gathering of the Confederates near Beverly determined him to proceed to that region and postpone his Kanawha campaign till northwestern Virginia should be cleared of the enemy. Later it was found that the presence of Wise in the Kanawha Valley menaced his flank and 2 July Gen. Cox, with a brigade, was ordered to cross the Ohio at Gallipolis and conduct a campaign against Wise, and on the 6th he was ordered to march on Charleston and Gauley Bridge. Cox crossed the Ohio, with about 3,000 men, drove in some of Wise's advanced detachments, and on 11 July moved up the Great Kanawha River in transports. The river was navigable for small steamers about 70 miles, to a point 10 or 12 miles above Charleston, the only important town of the region

WEST VIRGINIA CAMPAIGN OF 1861

which is at the confluence of the Kanawha and Elk rivers. On the evening of the 16th Cox reached the mouth of the Pocotaligo, a large creek which enters the Kanawha from the north, where he heard that some of Wise's forces were in position above the mouth of Scary Creek on the south side of the Kanawha, and about three miles distant. It was necessary to dislodge this force before he could proceed farther. Troops were landed on the south side of the river, on the 17th, and the position was attacked, but Cox's men were repulsed with a loss of 14 killed and 47 wounded. (See SCARY CREEK, ENGAGEMENT AT.) This check delayed Cox until he could get land transportation, which came up on the 23d, and the next day he advanced, took Charleston on the 25th, which Wise had hurriedly abandoned, and on the morning of the 26th reached Gauley Bridge. Wise retreating before him and not halting till he reached Greenbrier and the White Sulphur Springs, where he was joined by Gen. Floyd. The whole of West Virginia, with the gateways to the East were now in Union possession, but the Confederates did not let the possession go unchallenged and made efforts to recover the lost ground.

After the defeat and death of Gen. Garnett, Gen. W. W. Loring was ordered to the command of the Confederate forces in northwestern Virginia, and being strongly reinforced began preparations to retake Cheat Mountain. Before these preparations were completed, Gen. R. E. Lee was assigned to the command of all the Confederate forces in West Virginia, and early in August joined Loring at Valley Mountain, where he remained a month, making himself acquainted with the country, bringing up reinforcements and supplies, and elaborating a plan of campaign by which he proposed to break through the Alleghanies and recover the country west to the Ohio. His point of attack was the Union position covering Beverly and the road westward. McClellan had been called to Washington, leaving Gen. Rosecrans in command in West Virginia, and Gen. J. J. Reynolds had command of the Union troops holding intrenched positions at Cheat Mountain summit, Elk Water and Huttonsville. Two Confederate columns were sent by the Staunton road against Cheat Summit and one by the Lewisburg and Huntersville road against Elk Water. At the same time another column was ordered to pierce the line between Elk Water and Cheat Summit, a distance of eight miles through a trackless mountain forest, to gain the rear of both positions. The movement began on 11 September, a part of Lee's command succeeded in reaching the rear of the Union troops at the Summit, a part attacked by the Staunton road in front, and both were repulsed. The column sent against Elk Water appeared before that position but, upon the failure of the other columns made no attack, and on the 15th all the columns retired to their old positions. Lee was greatly disappointed and deeply mortified at his failure, and was under a cloud from which he did not emerge till after he had succeeded to the command of the Army of Northern Virginia, in June 1862. No further effort was made by the Confederates to regain the ground lost in the northwest, nor was a general Union advance attempted, but there were sharp encounters at Camp Bartow and

Camp Alleghany (qq.v.) both resulting in Confederate success.

Floyd and Wise, who had united forces near Lewisburg, moved forward in the middle of August to Sewell Mountain, and on the 23d Floyd crossed to the north side of Gauley River at Carnifax Ferry to flank Cox at Gauley Bridge and drive him down the Kanawha Valley to the Ohio. He attacked and defeated the 7th Ohio at Cross Lanes, on the 26th, and on 10 September was attacked by Gen. Rosecrans and that night recrossed the Gauley and retreated to Sewell Mountain (see CARNIFAX FERRY). After some delay Rosecrans advanced to the top of Big Sewell Mountain, 34 miles from Gauley Bridge and began skirmishing with the Confederates. Lee, with a part of Loring's command, joined Floyd on the 29 September and assumed command. The two opposing armies that lay opposite each other upon the crests of Big Sewell, separated by a deep gorge, were about equal in number, but each commander had exaggerated ideas of the strength of the other, and it was difficult for either to make an offensive move. Each was looking for weak points in his adversary's position, using extraordinary energy to feed the men and animals, and waiting for the rains to cease and the roads to dry. But the rains did not cease, there was an extraordinary rise in the waters and on the night of 5 October Rosecrans began to fall back and at the end of four days his brigades were in camp between Hawks' Nest and Gauley Bridge. When Lee discovered that Rosecrans had gone he ordered the cavalry to follow; when satisfied that he had gone clear to Gauley Bridge he began repairing the road from Sewell Mountain to Lewisburg, and projected a campaign for Floyd down the left bank of New River and then to the mouth of Loop creek, the head of navigation of the Kanawha to intercept Rosecrans' communications, while an effort was being made to press him in front. Floyd lost no time in preparing for the movement to drive Rosecrans from Gauley Bridge back to Charleston, probably to the banks of the Ohio. On 10 October he started and after a difficult march over mountain roads, crossed New River at Richmond Ferry, and toiled on over the Raleigh, Fayette and Kanawha turnpike, through Fayetteville, and on the 22d camped on Cotton Hill, five miles beyond Fayetteville, in the elbow south of the junction of the New and Gauley rivers. On the next day he wrote the Confederate Secretary of War that with a proper force he could dislodge Rosecrans from Gauley Bridge and drive him back to Clarksburg, with 10,000 additional men he would win the whole Kanawha Valley before the conclusion of the campaign. Meanwhile Lee had informed him that Loring's troops would march back to the Cheat region, and this settled the fact that he would have to measure strength with Cox unaided by any advance on the Lewisburg road. On 1 November he opened on Rosecrans with artillery. Rosecrans planned to capture him, and on the 12th Floyd retreated, narrowly escaping capture (see GAULEY BRIDGE). The campaign on the Kanawha, as in the Cheat region, was ended. The inclement weather rendered extended movements impracticable, and both Union and Confederates found ample employment in getting up supplies, maintaining the

WEST VIRGINIA UNIVERSITY — WESTALL

roads in condition, providing shelter and guarding against surprise. Scouting was restricted to narrow limits and the results were unimportant. But the campaign had been one of the greatest importance. The whole line of the Alleghenies, from the Pennsylvania border on the north and beyond the Kanawha on the south, was securely guarded against incursions from the east, and westward to the Ohio River, western Virginia was in the hands of the Union government. The political transformation of West Virginia kept pace with the military movements, finally resulting in a new State.

E. A. CARMAN.

West Virginia University, the State university located at Morgantown, W. Va. In 1814 the Monongalia Academy was incorporated by the Virginia legislature and located at Morgantown; and for 50 years was the leading school in the western part of Virginia. In 1864 the provisions of the land grant act of 1862 were extended to the new State of West Virginia, and in 1867 the West Virginia Agricultural College was founded. The property of the Monongalia Academy was then transferred to this college, and the new institution opened in August 1867. In 1868 the name was changed to West Virginia University. It is open to women on equal terms with men. The university now comprises the following departments: (1) the College of Arts and Sciences, (2) the College of Engineering and Mechanic Arts; (3) the College of Agriculture; (4) the College of Law; (5) the College of Medicine; (6) the College of Veterinary Science; (7) the Summer School; (8) the School of Music; (9) the Commercial School; (10) the School of Fine Arts; (11) the School of Military Science and Tactics; (12) the three preparatory schools at Morgantown, Montgomery, and Keyser. In the College of Arts and Sciences two courses are offered, the classical and the scientific, leading to the degrees of A.B. and B.S. Certain studies are required, but both courses are very largely elective; the subjects of study arranged in three groups, language, science, and philosophy (including history and pedagogy). Each student is required to elect a major, nine courses in one group, a minor, six courses in another group, and a sub-minor, three courses in the remaining group; for the degree of B.S. the major must be in science. The degrees of A.M. and Ph.D. are conferred for graduate work. The curriculum includes history and principles of education, school administration, and the art of teaching. Courses in science and theory of music count toward the A.B. degree. The College of Engineering and Mechanic Arts offers four years' courses in civil, mechanical, and electrical engineering leading to the degrees of B.S.C.E., and B.S.M.E.; and graduate courses leading to the degrees of C.E. and M.E. The undergraduate courses include general culture subjects: class-room work is supplemented by practical field and shop work. There are also special courses in manual training for teachers, and in the mechanic arts for practical mechanics, electricians, etc. The College of Agriculture offers a four years' course leading to the degree of

B.S. in agriculture, a one year's course in agriculture, and winter courses of 12 weeks in agriculture, animal industry, horticulture, and poultry raising. A dairy course was added in 1903-4. The College of Law offers a two years' course leading to a diploma, and a four years' course leading to the degree of LL.B. The medical department is the College of Physicians and Surgeons of Baltimore, which is affiliated with the university; the course is four years; the first two years' work may be done at Morgantown or Baltimore, the last two years' work is done at Baltimore. The Woman's Medical College of Baltimore has also been affiliated with the university on the same terms. In the School of Military Science and Tactics, 225 State cadets are appointed and receive their equipment and tuition free; students of the university may join the cadet corps for military instruction. The military course is the same as that at West Point; the State cadets also take courses in other departments of the university. The College of Veterinary Science has its hospital and its clinical department in Pittsburg, Pa. The Commercial School offers a full two years' course, including electives in the College of Arts and Sciences and the preparatory school; and shorter courses in special subjects, open to students in other departments. The Summer School offers courses in the general college subjects, and also for Sunday-school workers, with a session of one week. The university is one of the institutions affiliated with the Central Oratorical League, a students' organization for the maintenance of a high standard in public speaking. There are also literary societies, a choral society, an athletic association, and a Farmers' Grange for the members of the College of Agriculture. The campus (50 acres) occupies a picturesque site bordering on the Monongahela River; the buildings include Woodburn Hall, Martin Hall, Science Hall, Commencement Hall, Mechanical Hall, the Library (completed 1903), the Armory and Drill Hall, and the Agricultural Experiment Station. The library contained, in 1910, 41,000 volumes; in addition to which there are the libraries of the College of Law and of the experiment station, and the Willey Library. The income is derived mostly from the land grant endowment, the national appropriation for agricultural colleges, and the State appropriation. The students in all departments in 1910 at Morgantown numbered 1,422; this does not include the preparatory schools at Keyser and Montgomery.

D. B. PURINGTON,

President.

West Wind Drift. See CURRENTS, OCEAN.

Westall, Richard, English painter: b. 1765; d. London 4 Dec. 1836. He was apprenticed in London to an engraver on silver in 1779; subsequently studied at the schools of the Royal Academy and began to practise his art in association with Thomas Laurence in Soho Square. Here he became very popular as an illustrator of books and for a single design in water colors sometimes received \$400 or \$500. He also painted historical subjects. His 'Elijah Restoring the Widow's Son to Life' was purchased for some \$2,250 by the directors of the British Institution; but his paintings in oil were not generally salable; his designs and

figures are monotonously conventional, although some of his scenes from peasant life are by no means destitute of freshness and charm. One of his last occupations was that of teaching drawing to Princess afterward Queen Victoria of England. His water color painting, 'Cassandra Prophesying the Fall of Troy,' is now in the South Kensington Museum; and his pictures in oil of 'Christ Crowned with Thorns' in All Souls' Church, Langham Place, London.

Westall, William, English novelist: b. White Ash, Lancashire, 7 Feb. 1834; d. 9 Sept. 1903. He was educated at the Liverpool High School, engaged in business and in journalism, and was foreign correspondent for the *London Times* and *Daily News*, traveling in North and South America and in the West Indies. He has been a prolific writer and among his publications are: 'Tales and Traditions of Saxony and Lusatia' (1877); 'In Tropic Seas' (1878); 'Harry Lohengrin' (1879); and 'The Old Factory' (1881); 'Red Rivington' (1882); 'A Queer Race'; 'A Phantom City.'

Westboro, Mass., town in Worcester County, on the Boston & Albany Railway, 12 miles east of Worcester, 32 miles west by south of Boston. It contains five churches, a public library with 12,000 volumes, the Westboro Insane Hospital, the Lyman Reform School, a savings bank, a national bank, a weekly newspaper, and numerous important manufacturing industries, the chief being those connected with straw and leather goods, boots and shoes, and automobiles. Westboro was settled about 1659, and at first known as Chauncy, but in 1717 it was incorporated under its present name. Pop. (1910) 5,446.

Westbrook, Maine, city in Cumberland County; on the Presumpscott River, and on branches of the Boston & Maine and the Maine R.R.'s; six miles northwest of Portland. Electric lines extend to Portland. The river furnishes considerable water-power, which is utilized by manufacturing, chief of which are silk and cotton mills, paper and flour mills, and machine shops. The silk and cotton products are mainly dress goods, cotton warp, and seamless bags. In 1900 (government census) Westbrook had 42 manufacturing establishments, which were capitalized for \$3,950,221, and in which were 1,405 employees. The raw material cost annually \$1,372,166, and the finished products were valued at \$2,851,660. The bank has a capital of \$50,000, and, in 1903, had \$396,760 in deposits. The city has eight churches, the Presentation Convent, a high school, public and parish elementary schools, and the Walker Memorial Library. Pop. (1890) 6,632; (1900) 7,283; (1910) 8,281.

Westbury, Richard Bethell, BARON, English jurist and statesman: b. Bradford-on-Avon, Wiltshire, 30 June 1800; d. London 20 July 1873. Graduated from Oxford in 1818, he was admitted to the bar at the Middle Temple in 1833, in 1852 became solicitor-general, and in 1856-8 was attorney-general under Lord Palmerston. This post he held a second time, in 1859-61, and in 1861 he became lord-chancellor. As chancellor he did much by his decisions to aid the development of British equity jurisprudence, especially so in joint stock-company law, ecclesiastical appeals, and patent law.

Westcott, west'kôt, Brooke Foss, English bishop and theologian: b. Birmingham January 1825; d. Bishop Auckland 27 July 1901. He was graduated from Trinity College, Cambridge, in 1848, was elected a fellow of his college in 1849, and in 1851 was ordained in the English Church. He was assistant master at Harrow 1852-69, and here he remained till 1869, when he became a residentiary canon of Peterborough. He became canon of Westminster in 1883, and on the death of his friend Lightfoot, bishop of Durham, was appointed his successor in 1890, and in this see he remained till his death. He showed a deep interest in the lot of the miners in his diocese, which won him their genuine esteem, and he was very successful in preventing and settling industrial disputes. From 1870 to 1890 he was regius professor of divinity at Cambridge, and during his tenure of the office exercised a powerful and abiding influence on undergraduates and scholars. As a scholar and theologian Westcott's position was a very high one. As a textual critic he is best known for his share in the revision of the Greek text of the New Testament, which occupied him and J. F. A. Hort for 28 years, and resulted in the publication of their important work, 'The New Testament in the Original Greek,' in 1881. The text formed the basis of the Revised Version of the New Testament. His other published works include among others: 'General Survey of the History of the Canon of the New Testament During the First Four Centuries' (1855), a standard work which has gone through many editions; 'Introduction to the Study of the Gospels' (1860), another work of much value which has gone through numerous editions; 'A General View of the History of the English Bible' (1868); 'The Paragraph Psalter' (1879); 'The Revelation of the Risen Lord' (1882); 'Christus Consummator: Some Aspects of the Work and Person of Christ in Relation to Modern Thought' (1886); 'Social Aspects of Christianity' (1887); 'Essays in the History of Religious Thought in the West' (1891), a work of profound and suggestive thought; 'The Gospel of Life' (1892); 'The Incarnation and Common Life' (1893); 'Lessons of the Revised Version of the New Testament' (3d ed., 1898); 'Christian Aspects of Life' (2d ed., 1897); 'Lessons from Work' (1901); and 'Words of Faith and Hope' (1902). He was one of the New Testament revision company. Consult 'Life,' by his son (1903).

Westcott, Edward Noyes, American novelist: b. Syracuse, N. Y., 27 Sept. 1847; d. there 31 March 1898. He was a banker in his native city, but compelled to retire because of failing health, spent the winter of 1895-6 in Italy and in the latter year completed the novel 'David Harum,' which he had begun soon after his retirement from business. It was declined by many leading publishers, but when issued in the autumn of 1898, six months after the author's death, became at once a success, reaching a sale of 400,000 copies in a little more than a year. The construction of the novel is weak, but it is a faithful reflection of certain phases of life in central New York, and its humor is undeniable.

Westerly, R. I., town in Washington County; on the Pawcatuck River, and on the

New York, New Haven & Hartford Railroad. It is in the southwestern part of the State, near Long Island Sound. The Indian name, which for a time was retained by the white settlers, was Misquamicut. On 14 May 1669 the town was incorporated, under its present name. In 1686 the name was changed to Haversham, and in 1689 it was re-named Westerlo. The town contains five villages, each with its own post-office. Noyes' Beach and Watch Hill are favorite summer resorts. The chief manufacturing establishments are cotton and woolen mills. The granite quarries of the town are known for the quality and amount of their products. There are six banks; the three savings banks have deposits amounting to about \$4,500,000. Pop. (1910) 8,696.

Western Australia, one of the States of the new Commonwealth of Australia. See AUSTRALIA, WESTERN.

Western College, located at Toledo, Iowa. It was founded by the Iowa Conference of the United Brethren in Christ; was incorporated in 1856; and was opened to students in 1857. It was first located at Western, Linn County, but was moved to Toledo in 1881. In 1889 the main building was destroyed by fire, but was immediately rebuilt. The board of trustees consists of representatives of the alumni and of five conferences of the United Brethren, and three members-at-large. The college is open to men and women on equal terms. Two regular college courses are offered, the classical and the scientific, and the degrees of A.B. and B.S. are conferred. Both courses are almost entirely elective in the last two years, the list of electives differing in the two courses. In addition to the collegiate department, there are the Academic or Preparatory School, the Conservatory of Music, the College of Commerce, the School of Elocution and Oratory, and the Department of Art. Graduates from the collegiate courses are admitted to the senior year of Yale, Chicago, and Smith without examination. The buildings include the main building, the Bright Conservatory of Music, Mary Beatty Hall (the dormitory for young women, Drury Hall (the young men's dormitory), and the College Church. For several years a movement has been under way to secure an endowment fund of \$150,000. The library in 1909 contained 7,000 volumes; the students numbered 154, and the faculty 18.

Western Empire, The, the western portion of the Roman Empire, consisting of Italy, Illyricum, Spain, Gaul, Britain, and Africa, as distinguished from the Eastern or Byzantine Empire, comprising the eastern half of the Balkan Peninsula, Greece, Egypt, Syria, and Asia Minor, so far as Persia. This partition of the Roman Empire occurred in 364 when Valentinian I. shared the imperial authority with his brother Valens, who ruled in Constantinople as Emperor of the East, while Valentinian ruled in Rome as Emperor of the West. The partition became final in 395 when Theodosius the Great divided the Roman world between his two sons Honorius, who became Emperor of Rome and the West, and Arcadius, who became Emperor of Constantinople and the East. The Western Empire terminated in 476. See BYZANTINE EMPIRE: ROMAN.

Western Federation of Miners, an organization including all workers in and around

mines, mills, and smelters, for the improvement of their industrial and social condition. The Federation opposes the truck system, child labor, contract labor, and the use of the injunction in strikes, and has made special endeavor to obtain the eight-hour day for all workers. The executive officers are a president, a treasurer, and a secretary; there is also an organizer for each district (six in 1904); and these officers constitute the executive board. The Federation holds annual conventions and also provides for referring questions of policy and government to a referendum vote of the members. The executive board must approve every strike before it receives the support of the union. The Federation is a radical and militant organization, it endorses Socialism, and political action by workingmen. Its motto, which appears on the back of every union membership card, is "Labor produces all wealth: wealth belongs to the producers thereof." Its official organ is the "Miners' Magazine." It was organized in 1893, and took the lead in the organization of the American Labor Union with which it is now affiliated. (See LABOR UNION, THE AMERICAN.) In 1894 it conducted a strike in the Cripple Creek region; considerable violence occurred and the militia was called out, but the strike was settled largely to the Federation's advantage. In 1899 it became involved in another large strike, in the Cœur d'Alene mines; a number of riots, the most serious on 29 April, resulted in martial law being declared, the county officers being very generally in sympathy with the strikers. Large numbers of the striking miners were arrested and imprisoned in a temporary prison or stockade, called the "bull pen." Men were found to take their places to some extent, and the strike was a failure. Since that time, however, the Federation has grown in numbers and in influence; it has succeeded in unionizing the majority of the mines of the Western States, and has gained a considerable amount of political control in the mining towns. In 1904 a large strike was inaugurated in the Cripple Creek region, the immediate cause being certain mine owners' discrimination against union men. The mine owners were joined by an association of business men, known as the Citizens' Alliance, whose express purpose is the destruction of the miners' organization; some violence was committed, and the situation became so serious that the governor of Colorado declared martial law. Under this law, miners were imprisoned or deported in large numbers from the vicinity of the mines. Some of the mines returned to work, but with a reduced force, or under such difficulties that they were again forced to suspend and the Federation will not admit defeat.

Western Islands. See AZORES; HEIMTUS.

Western Maryland College, located at Westminster, Md. It was founded under the auspices of the Methodist Protestant Church, and was first opened to students in 1867. It was the first college in the South to offer equal educational privileges to both sexes; but it is not strictly co-educational, as there are separate classes for women, though they are taught by the same instructors and have practically the same courses of study as the men. The courses of study are arranged in three groups, which are practically the same in the first two years, but differ in the last two, and in accordance with

the predominating study are known as the classical, the scientific, and the historical. The degree of A. B. is conferred for the completion of a four years' course in any of these groups. In addition, courses are offered in music, art, and elocution, and students who complete one of these courses may substitute it for certain studies of the Junior year. There is also a preparatory school which in 1899 was established in a separate building (Levine Hall) a short distance from the campus. There are two State scholarships for each senatorial district. The campus contains 14 acres situated on elevated ground in the western part of the city. The main building consists of a central part, the original building, and five wings: (1) Owings Hall, extending back from the central part, (2) Smith Hall, extending to the east; (3) Hering Hall, extending to the west; (4) Ward Hall, a rear extension of Hering Hall; and (5) a rear extension of Smith Hall. Other buildings are the Yingling Gymnasium, Y. M. C. A. Hall, Baker Chapel, built of white stone, and Alumni Hall, containing a large assembly room, the halls of the literary societies, etc. The students in 1910 numbered 222, and the faculty 20.

Western Reserve, or Connecticut Reserve, that portion of the Northwest Territory (q.v.) reserved by Connecticut when, in 1786, that State ceded to the United States other parts of the territory claimed under the charter of 1662, which granted to Connecticut lands limited east and west by the sea. This section of land is what is now included in the northeastern part of Ohio; it was all the territory between lat. 41° and 42° 2' N., and extending 120 miles from the western boundary of Pennsylvania. In 1795-6 Connecticut sold this land, except 300,000 acres, to a number of men who established what was known as the Connecticut Land Company. At first settlers hesitated about purchasing any of the land on the "Reserve," fearing the validity of the title, but when the State of Connecticut yielded all claim to the government, there was no longer any doubt about the title. There were a large number of colonists from Connecticut who settled on this "Reserve," counties were organized, 13 in all, which were in whole or in part from lands of the "Reserve." (See *Nowalk, Ohio*.) The people were characterized by their thrift, industry, and the manner in which they established schools. A large part of the money received by Connecticut, for the sale of the lands, was set aside "as a perpetual fund, the interest of which should be appropriated to the support of schools." This school fund was the means of influencing in Ohio a unique system of education, in some respects different from that of any other State. Consult Matthews, 'Ohio and Her Western Reserve' (1902).

Western Reserve University, located at Cleveland, Ohio, includes the College for Women, the Graduate School, the Medical School, the Law School, the Dental School, and the Library School. As a working, though not a corporate, part of Western Reserve University is Adelbert College of Western Reserve University. Adelbert College of Western Reserve University was founded as Western Reserve College in Hudson, 26 miles from Cleveland, in 1826. As the territory formerly belonged to Connecticut, and derived its name from being territory in the West reserved for special pur-

poses, so also the influence of Connecticut's great college dominated in its establishment and during its first decades. In affiliation with the college at Hudson for many years was the Cleveland Medical School. Theological instruction was also given for many years, ceasing in 1853. In 1882 Western Reserve College was moved to Cleveland. Amasa Stone (q.v.) gave to the college the sum of \$600,000. In recognition of the gift the college took the name of a beloved son of Mr. Stone, who died while a student at Yale, becoming Adelbert College of Western Reserve University. Subsequent gifts and bequests, together with gifts made by members of his family, have amounted to more than \$1,100,000. In 1884 a university charter was obtained. The following departments, in addition to the Medical School, were established. In 1888 the College for Women, in 1892 the Dental School, the Law School and the Graduate School, and in 1903 the Library School. The Library School was endowed by a gift of \$100,000 made by Andrew Carnegie.

The college and the university have throughout their history been distinguished by a high type of scholarship. Among the professors have been Rev. Laurens Perscus Hickok, 1836-44; Rev. Clement Long, 1844-52; Nathan Perkins Seymour, 1840-70; Elias Loomis, 1836-44; Charles Augustus Young, 1856-66; Elijah Porter Barrows, 1837-52; Samuel St. John, 1838-52; Samuel Colcord Bartlett, 1846-52. Its presidents have been Charles Backus Storrs, 1830-33; George Edmond Pierce, 1834-55; Lawrence Hitchcock, 1855-71; Carroll Cutler, 1871-86; Hiram Collins Haydn, 1887-90; Charles Franklin Thwing, 1890—. The whole number of students in the different departments from the beginning has been as follows: Adelbert College, 2,091; College for Women, 750; the Graduate School, 150; the Medical School, 4,000; the Law School, 475; and the Dental School, 350. The buildings and equipment are valued at \$1,396,400 and the entire property at \$2,834,300.

In the general educational endeavor known as Western Reserve University are two administrative features of special significance. One lies in the co-ordinate method of education. A college for men, Adelbert College, and a college for women exist as essential members of the same university. Each has its own faculty and government. The two bodies of students are distinct. Each college has its endowment and buildings. The work in the sciences, however, is done in the same laboratories, but usually at different times. Professors in the same departments of the two institutions exchange courses of instruction to a certain extent. The co-ordinate method is in part a co-operative method. In a State and a part of the country noted for co-education, the method prevailing in Western Reserve University is conspicuously successful. A further significant method of administration relates to the co-operative course of study established between the Case School of Applied Science and Adelbert College. These two institutions are planted upon the same campus and each has its own board of trustees. But the two faculties have arranged a course of instruction covering five years, three of which are spent in pursuing the liberal studies of the undergraduate college (Adelbert College) and the last two years are spent in the technical school (Case School of Applied Science). At the conclusion

WESTERN UNIVERSITY OF PENNSYLVANIA — WESTFIELD

of the five-year course a bachelor of arts and a bachelor of science degree are given. Thus, the advantages of the liberal course of study are conserved and the efficiency of the specialized course also gained. **CHARLES F. TRWING,**
President.

Western University of Pennsylvania, located at Allegheny, Pa., with its professional schools at Pittsburg. It was founded in 1786 and chartered in 1787, thus being the second oldest institution of learning west of the Appalachian Mountains. In 1819 its curriculum was extended, and the name changed to Western University of Pennsylvania. At first it was located at Pittsburg, and the building was destroyed in the fire of 1845; a new building was erected, but also destroyed by fire in 1849; and the university was compelled to suspend work for five years. Since that time, it has largely increased its endowment and has been uniformly prosperous. In 1895 all courses of the university were opened to women. The university now includes the following departments: (1) the Collegiate Department; (2) the Engineering Department; (3) the Western Pennsylvania School of Mines and Mining Engineering; (4) the Allegheny Observatory; (5) the Pittsburg Law School; (6) the Western Pennsylvania Medical College; (7) the Pittsburg College of Pharmacy; (8) the Pittsburg Dental College. The Collegiate Department offers three courses, the classical, the Latin-scientific, and the scientific; the degree of B.S. is conferred on the completion of the scientific course, the degree of A.B. for the other two courses. Nearly all of the work in the last two years of the classical, scientific, and Latin-scientific courses is elective. A special course providing more thorough and continuous work in chemistry is open to scientific students. The degrees of A.M. and M.S. are conferred for graduate work. The Engineering Department offers three courses, civil, mechanical, and electrical engineering; the School of Mines offers a course in mining engineering; the degrees of civil engineer, mechanical engineer, electrical engineer, and mining engineer are conferred. The work of the first two years of the course in mining engineering is the same as that of the course in mechanical engineering. The School of Mines was established as a department of the university in 1895, when the State legislature appropriated \$50,000 for that purpose. The Allegheny Observatory was founded in 1859 by the Allegheny Astronomical Society; and in 1867 with the other property of that society was transferred to the University; its chief function is the promotion of original research, and the providing of graduate work. The Department of Law offers a three years' course, on the completion of which the degree of LL.B. is conferred. The Medical Department confers the degree of M.D. for a four years' course; the Reineman hospital is under university control, and other hospitals offer opportunities for clinical work. The College of Pharmacy offers a two years' course leading to the degree of graduate in pharmacy, and in addition an advanced third year course, graduates of which are entitled to the degree of doctor of pharmacy; the degree of pharmaceutical chemist is conferred for the completion of three terms' work. The course in the Dental College is three years in length, and leads

to the degree of D.D.S. There are several endowed scholarships in the Collegiate and Engineering departments, 12 of which are for colored students, and three for descendants of members of the Grand Army of the Republic; there are also a number of high school scholarships for honor students in accredited high schools. The students maintain a literary society, an athletic association, an electrical club, and glee and mandolin clubs. The Collegiate Department, the Engineering Department and School of Mines are located at Allegheny; the Observatory at Riverview Park, Allegheny, in buildings erected in 1902; the other departments are in the city of Pittsburg; the medical department has a clinical building, erected 1897, known as the Emma Kaufmann Clinic. The library contains approximately 25,000 volumes, including the Robert Watson Library, and the departmental libraries; in addition, the Carnegie libraries of Allegheny and Pittsburg are open to students, and the Allegheny County Law Library to law students. The students number nearly 800, distributed about as follows: College and Engineering, 150, Medical 270, Dentistry 140, Pharmacy 130, Law 100. The faculty, including assistants and demonstrators, numbers about 144. The University is planning a new location in the eastern part of Pittsburg on which will be gathered all the departments of the institution.

S. B. MCCORMICK,
Chancellor

Westfield, Mass., town in Hampden County; on the Westfield River, and on the Boston & A. and the New York, N. H. & H. R.R.'s; nine miles west of Springfield. The chief manufacturing establishments are machine-shops, paper mills, thread mills, bicycle and whip factories, and cigar factories. In 1900 (government census) the town had 186 manufacturing concerns, capitalized for \$4,345,372 and employing 2,641 persons, to whom were paid annually \$1,229,643. The total cost of raw material used annually was \$2,401,460, and the value of the yearly products was \$5,072,074. From 1900 to 1904 there has been considerable increase in the amount of productions. The valley in which Westfield is located is noted for its beauty; the town has a park, Woronoco, an excellent water-supply, which is brought from Montgomery Mountain, seven miles distant, and a good sewerage system. The water plant, completed in 1874, cost nearly \$250,000. There are seven churches, the Massachusetts State Normal School, a public high school, established in 1855, public and parish elementary schools, kindergartens, and a public library, which contains nearly 20,000 volumes. There are four banks; the two national banks have a combined capital of \$400,000; the two savings banks have (1903) deposits amounting to \$3,600,890.

Westfield is on the site of an Indian village which was called Woronoco. Pop. (1910) 16,044.

Westfield, N. J., village in Union County; on the Central Railroad of New Jersey; about 20 miles southwest of New York. It is mainly a residential village, in a beautiful location, on an elevation. The roads leading out into the country places are excellent. There are six churches, public and private schools, and a national bank. Pop. (1910) 6,430.

WESTFIELD—WESTMACOTT

Westfield, N. Y., village in Chautauqua County; on the Chautauqua Creek, and on the New York, C. & St. L. and the Lake Shore & M. S. R.R.'s; about 60 miles southwest of Buffalo, and 20 miles southwest of Dunkirk. It is in an agricultural and fruit region, in which the chief products are grapes, apples, peaches, and pears. It has railroad shops, a grist-mill, and fruit-basket and crate factories. There are six churches, a union school and academy, which has two endowed scholarships, and a public library, founded by Hannah Patterson by a gift of \$100,000. There is a national bank with a capital of \$50,000. Pop. (1890) 1,983; (1900) 2,430; (1910) 2,985.

Westfield College, located at Westfield, Ill. It was founded in 1861 under the auspices of the United Brethren. It confers the degree of A.B. for the completion of the four years' college course. In addition to the degree course there are normal and business courses and a preparatory department. In 1910 the grounds and buildings were valued at over \$50,000. The income is derived mainly from tuition and incidental fees. In 1910 the library contained over 3,000 volumes, the students numbered 150, and the faculty 9.

Westford, Mass., town in Middlesex County; on the Boston & Maine Railway, 6 miles southwest of Lowell. It contains several villages, and has four churches and a public library. There are manufactures of woolen goods and machinery, and agriculture and granite-quarrying are carried on. Pop. (1910) 2,851.

Westinghouse, George, American inventor: b. Central Bridge, N. Y., 6 Oct. 1846. He entered the machine shop of his father, a manufacturer of agricultural implements, when very young and early evinced an inventive genius, designing at 15 a rotary engine. He served in the Union army in 1863-4, and in 1864-5 was assistant engineer in the United States navy, after which he studied at Union College for two years. He continued his interest in mechanics, his first invention of importance being a railway frog. In 1866 he introduced the famous Westinghouse brake (see AIR-BRAKE), which he has since developed to a remarkable degree of efficiency, and which has come into international use. He was one of the pioneers in introducing alternating-current machinery, and he succeeded in securing the use of this method at the Chicago Exposition in 1893. He has also made numerous improvements in railroad signaling, and through his devices the safety of high-speed railway traveling has been greatly increased. He has erected extensive works in this country and abroad for the manufacture of his various inventions, and is president of numerous corporations. He received the Order of Leopold from the Belgian king in 1884, and in 1889 the Royal Order of the Crown from the king of Italy. He was also decorated with the French Legion of Honor.

Westlake, William, American inventor: b. Cornwall, England, 23 July 1831; d. Brooklyn, N. Y., 28 Dec. 1900. He came to the United States in 1847, settled in Milwaukee, Wis., and there was employed in a printing office. He was subsequently an apprentice to a tinsmith, and in 1853 made for Captain John Ericsson the models for his first hot-air engine. He entered the em-

ploy of the La Crosse & Milwaukee Railroad Company in 1857, and soon after began the series of inventions which made him famous. Among them are the Westlake car heater, the globe lantern, the first practical car lamp, the oil cook stove, the stoveboard, etc.

Westland, New Zealand, a provincial district in South Island, bounded north by Nelson district, south by Otago, west by the ocean, and east by Canterbury, from which it is separated by the chain of the Southern Alps. It is about 200 miles long and about 30 miles in average breadth, its area being about 4,642 square miles. It consists principally of hills branching off from the great alpine system, intersected by narrow bush-clad valleys, and merging coastward into undulating plateaus, river valleys, and shelving coasts. The rivers are numerous but short. Practically the whole of the district is covered with forest. Large tracts can be prepared easily for pastoral purposes, but there is little ground suitable for agriculture. Gold is found in the valleys of the rivers, especially in those of the Arahura and Waibo, and gold-bearing quartz is also worked in some places. Silver, copper, iron, and tin are among the other metallic treasures of the district, which has also yielded much coal, especially from the valley of the Grey. The climate is equable and temperate. This rainfall is heavy, and snow lies on the high mountains during much of the year. The capital is Hokitika, the other chief towns being Greymouth, Brunner, Kumara, and Ross. Railways connect Greymouth with Hokitika, Jackson, and Reefton (in Nelson district). Westland was formerly part of Canterbury district.

Westmacott, west'ma-kōt, Richard, English sculptor, son of Sir Richard Westmacott (q.v.): b. London 1799; d. there 19 April 1872. He studied under his father, and also in Italy 1820-6, and after returning to England rose to prominence in his art. In 1857 he succeeded his father as professor of sculpture at the Royal Academy, having become associate member of the Academy in 1838 and a full member in 1849. His style resembled that of his father in many respects. He published a 'Handbook of Sculpture' (1864) and a pamphlet 'On Coloring Statues.'

Westmacott, Sir Richard, English sculptor: b. London 1775; d. there 1 Sept. 1856. He was the son of Richard Westmacott, also a sculptor, and was early trained to a knowledge of art by his father. In 1793 he was sent to Rome to study his profession under Canova, and there gained the annual gold medal for sculpture given by the pope at the Academy of St. Luke. He also obtained a first prize for sculpture at Florence, and was elected a member of the Academy there. In 1798 he returned to England, and rose rapidly into estimation as an artist. Many of the monuments in St. Paul's Cathedral are by him, and that building forms, in some respects, a gallery of his works. The figure of a Welsh girl in a monument to the memory of Lord Penrhyn, at Penrhyn, in North Wales, is considered by many as his best creation. He designed also the statue of Nelson in Birmingham, besides figures of Addison, Pitt, and many others. He became an associate of the Royal Academy in 1805, a full member in 1811, and in 1827 succeeded Flaxman as lecturer to the Academy on sculpture. He was knighted in 1837.

WESTMINSTER—WESTMINSTER ASSEMBLY OF DIVINES

Westminster, London, England, a metropolitan borough, formerly the ancient City and Liberty of Westminster, which still retains its civic title and certain privileges. Area, 2,508 acres. It is bounded on the south and east by the river Thames; east by the city of London, from which it was separated by the former Temple Bar; north by Holborn, Marylebone, and Paddington; and west by Kensington and Chelsea. It is connected with Lambeth by Vauxhall, Lambeth, Westminster, and Waterloo bridges. The parliamentary borough of Westminster created by the act of 1885 is practically coterminous with the parish of Saint Margaret and Saint John the Evangelist, the remainder of the city constituting the parliamentary boroughs of Saint George, Hanover Square, and the Strand. The city contains some of the finest and most imposing buildings in London, and teems with historical and literary associations. All the metropolitan royal palaces are within its limits, and also Westminster Abbey, the Houses of Parliament, a fine modern Roman Catholic cathedral, the principal government buildings, the headquarters of the London county council and the metropolitan police force, the National Gallery, and the Tate Gallery, Burlington House, Somerset House, and the new Caxton Hall, and the principal theatres and opera-houses.

The history of Westminster goes back to a very early period. It became a city when, in 1540, Henry VIII. made it the see of a bishop, and even though the see was suppressed ten years later it retained the right to the style of city. The only (Anglican) bishop of Westminster was Thomas Thirlby. Since 1831 a branch of the Grosvenor family has borne the title of marquis, and since 1874 of Duke of Westminster. In 1850 a Roman Catholic archiepiscopal see of Westminster was created by Pope Pius IX., the first occupant being Cardinal Wiseman. Pop. of city and metropolitan borough about 190,000. See LONDON.

Westminster, Md., city, county-seat of Carroll County; on the Western Maryland Railroad (Wabash System) about 35 miles northwest of Baltimore. Two new (1904) railroads are under consideration. The city is in an agricultural section, but it has considerable manufacturing interests. The chief industrial establishments are flour mills, carriage factories, canneries, and cigar factories. In the canning season about 500 employees are engaged in the canning factories. There are nine churches. The educational institutions are the Western Maryland College (Methodist Protestant), opened in 1868; public and parish schools. The three national and two savings banks have a combined capital of \$400,000, and deposits of over \$2,000,000. The government is vested in a mayor and the common council of Westminster. The council consists of five members, elected annually, the first Monday in May.

The place was settled in 1724 by persons from the north of Ireland and a colony of English from Prince George County, of which at that time it was a part. Some Germans were also among the first settlers. The inhabitants at present are nearly all American born, descendants of Germans, Irish, English, Dutch, and French. Pop. (1910) 3,310.

WILLIAM H. VANDERFORD,
Editorial Department, 'Democratic Advocate.'

Westminster Abbey. See LONDON, Church Buildings.

Westminster Assembly of Divines, a celebrated assembly held in the middle of the 17th century for the settlement of a general creed and form of worship throughout Great Britain, at a time when Presbyterianism had gained a strong position in England as well as in Scotland. On the 23d of November, 1641, the House of Commons (Long Parliament) addressed to the king a remonstrance desiring a synod of the most learned and pious men throughout the island for the settling of the government of the church; but it was not till 1643, after the civil war had begun, that an ordinance was passed (on 19 June) convoking the long-proposed assembly of divines. By this act 121 clergymen, with 10 lords and 20 commoners as lay assessors, were nominated as constituents of the assembly. Among the first were—the bishops of Exeter and Worcester, Drs. George Morley, John Hacket, William Nicholson, Edward Reynolds, and Robert Sanderson, afterward bishops respectively of Winchester, Lichfield, Gloucester, Norwich, and Lincoln; Dr. James Ussher, archbishop of Armagh; Edmund Calamy, John Lightfoot, Cornelius Burges, Thomas Twisse (prolocutor), and numerous other distinguished divines of the Calvinistic or Puritan party. The lay members comprised John Selden, the two Sir Harry Vanes (father and son), Oliver Saint John, John Pym, and other noted adherents of the popular cause. The assembly commenced its sittings on 1 July 1643, in Henry VII.'s chapel, at Westminster Abbey, but in the meantime a proclamation forbidding the assembly to meet had been issued by the king on 2 June, which had the effect of inducing the greater part of the Episcopal members to absent themselves, and Episcopacy was thus almost entirely unrepresented. The majority of those who remained were Presbyterians, but there was a powerful and energetic minority of Independents. A deputation was now sent along with commissioners from the English Parliament to the general assembly of the Scottish Church and the Scottish Convention of Estates, soliciting their co-operation in the proceedings of the Westminster Assembly, and accordingly on 15 September four Scottish clergymen, Alexander Henderson, George Gillespie, Samuel Rutherford, and Robert Baillie, with two laymen, Lord Maitland and Sir Archibald Johnston of Warriston, were admitted to seats and votes by an act of the English legislature. The assembly continued to hold its sittings till 22 Feb. 1649. Among the results of its deliberations were the directory of public worship, which was presented to Parliament on 20 April and ratified on 2 Oct. 1644; the Confession of Faith presented to Parliament in October and November, 1646, and ratified, with a few verbal alterations, in March, 1648; the Shorter Catechism, presented to the House of Commons on 5 Nov. 1647, and the Longer Catechism on 15 Sept. 1648. In the latter period of the sittings of the assembly the growing power of the Independent party in Parliament presented a serious obstacle to the carrying into effect of its recommendations, though in 1648 an order of Parliament was pronounced declaring "all parishes and places whatsoever," with the exception of chapels for the king and peers, to be under the Presbyterian form of church government. The accession of

WESTMINSTER COLLEGE—WESTON

Cromwell to power destroyed the hopes of the Presbyterians, and on the Restoration the whole proceedings of the Westminster Assembly, with the ratifications of Parliament, were annulled as invalid.

While this celebrated convocation was thus allowed, as regards England, to remain almost inoperative, its deliberations have left on Scotland and on Presbyterianism as established in the United States, an impress which will never be effaced. The present standards of the Presbyterian churches are made up of the various formularies above enumerated. They were ratified by the Scottish General Assembly, as follows: The Directory of Public Worship in February, 1645; the Confession of Faith in August, 1647; and the Longer and Shorter Catechism, in July, 1648. Consult: Hetherington's 'History of the Westminster Assembly' (1843; 6th ed., 1891); the 'Minutes of the Assembly,' edited by Mitchell and Struthers (1874); Mitchell's 'The Westminster Assembly' (1893); etc. See **PRESBYTERIANISM**.

Westminster College, located at Fulton, Mo. It was founded in 1853 by the Missouri Synod of the Presbyterian Church. Though badly crippled during the Civil War by reduction in numbers and loss of endowment, the college continued its work throughout the war. In 1892 a bequest of nearly \$120,000 for permanent endowment was received, and in 1897 the Alumni Association began a movement for further increase of this fund. In 1901 an amendment of the charter placed the college under the joint control of the Southern and the Northern synods of Missouri. The college formerly conferred the three degrees of A.B., B.L., and B.S. for the completion of the classical, literary, and scientific courses respectively; but recently arranged its course in three groups corresponding to the former three courses, and confers the single degree of A.B. Each group includes required and elective studies. Bible study is required, and Hebrew is among the electives. There is also an academy offering a classical and a literary and scientific course and commercial courses. The campus comprises 18 acres on a wooded slope bordering on Stinson Creek. There are now four buildings. In 1910 the library contained 7,000 volumes, the students numbered 175 and the faculty 12.

Westminster College, located at New Wilmington, Pa. It was chartered in 1852, as Westminster Collegiate Institute under the auspices of the United Presbyterian Church. The board of trustees now consists of 40 members, the majority of whom are elected by two synods of that church. The name was changed to Westminster College in 1892. The college offers two four years' courses leading to degrees, the classical and the scientific, and confers the degrees of A.B. and B.S. The work of the scientific course is mostly required; that of the classical course largely elective in the junior and senior years. Greek is required for the A.B. degree. There are also a three years' preparatory course, a department of music, and an art department. The students maintain four literary societies. Any student taking more than one study of the classical course is required to belong to one of these societies. There is no general athletic association, but a football association, baseball association, etc. The college has a pleasant situation on

elevated ground, some parts of the campus commanding a fine view. The buildings are the main building, science hall, the ladies' hall, and the gymnasium. In 1902 a commission was organized by the synods in control for the raising of a semi-centennial endowment fund. The students in 1910 numbered 274, of whom 173 were in the collegiate courses; the faculty numbered 10.

Westminster Hall. See **LONDON, Houses of Parliament**.

Westminster, Order of the Holy Cross of. See **ORDERS, RELIGIOUS**.

Westminster Palace, London, England, an alternative name for the Houses of Parliament, perpetuated from the ancient palace built by Edward the Confessor as a royal residence, and which contained the various national administrative and judicial offices. With the exception of the great hall, the building was destroyed by fire in 1834. The site is occupied by the new palace of Westminster or Houses of Parliament. See **LONDON, Houses of Parliament**.

Westminster School, an ancient English public school established in Westminster Abbey by Henry VIII., and refounded in 1560 as Saint Peter's College by Queen Elizabeth. The school buildings closely adjoin the abbey, several of them having once been a part of the domestic buildings of the abbey, the great schoolroom being originally the monks' dormitory; others, such as Ashburnham House, belonging to the Post Reformation period. The institution was reorganized in 1868 as one of the seven principal public schools of England. The Westminster play, for which this school is noted, is a yearly performance by the pupils of some Latin comedy. Many eminent Englishmen have been educated at this school. Consult: Forshall, 'Westminster School, Past and Present' (1884); Barker and Stenning, 'Westminster School Register' (1893).

Westminster Standards. See **PRESBYTERIANISM**.

Weston, Edward, American electrician: b. London, England, 9 May 1850. He came to the United States in 1870 and engaged as chemist to a nickel-plating company. He devised various improvements in the process of nickel-plating, and invented several dynamo-electric machines, establishing at Newark, N. J., in 1875, the first factory in America devoted exclusively to the manufacture of the latter class of machines. After the consolidation of his plant with another company in 1881 he continued as its electrician until 1888. He has since devoted his attention to the improvement of appliances for lighting by electricity, and has introduced improvements in both arc and incandescent lighting. He was one of the founders of the American Institute of Electrical Engineers, of which he has been president since 1888.

Weston, W. Va., town, county-seat of Lewis County; on the West Fork of the Monongahela River, and on the West Virginia & Pittsburgh Railroad; about 78 miles south by east of Wheeling and 71 miles south by east of Parkersburg. It is in an agricultural region, in which considerable attention is given to stock-raising. It has a flour mill, lumber and planing mill, and machine shops. A State Hospital for the Insane is located here. The two banks have a combined capital of \$150,000. Pop. (1910) 2,780.

WESTPHALIA—WESTPORT

Westphalia, west-fäl'ä, or **Westfalen**, wĕst'fāl'ĕn, Germany, a name originally given (1) to a large region of Germany, (2) to a duchy; (3) to an ancient imperial circle; (4) to a kingdom; (5) to a province of Prussia. These various divisions will be described in the above order.

1. The name of Westphalia was given from the second half of the 8th century to the western part of the ancient Duchy of Saxony incorporated by Charlemagne in the kingdom of the Franks, that is, to all the country between the Weser and Rhine, while the territory between the Elbe and Weser was called Eastphalia (Ostfalen). The latter name was lost after the dissolution of the Duchy of Saxony in 1180; the former was retained, and was applied in the first place to a newly erected duchy.

2. *Duchy of Westphalia*.—This was formed out of the part of the old Duchy of Saxony, then and still called Süderland or Sauerland, on the Upper Ruhr and Lenne. When Henry the Lion, the last of the old dukes of Saxony, was put under the ban of the empire, this territory was taken possession of by Philip of Heinsberg, archbishop of Cologne, who obtained the title of duke from Frederick Barbarossa. Cologne remained in possession of it until the dissolution of the archbishopric in 1801, upon which it was given, by way of indemnity, to Hesse-Darmstadt. In 1813 it was ceded by this power to Prussia, and was united with the Prussian province of Westphalia.

3. *Circle of Westphalia*, one of the ten circles into which the Empire of Germany was divided by Maximilian I. in 1512. It comprised the region between Lower Saxony, the Netherlands, Thuringia, and Hesse, as well as considerable tracts on the left bank of the Rhine; but the proper Duchy of Westphalia, as an appendage of Cologne, was considered as belonging to the electoral circle of the Rhine. Its total area was 22,175 square miles.

4. *Kingdom of Westphalia*.—The Peace of Tilsit (July, 1807) had made Napoleon master of all the Prussian territory west of the Elbe, and he also kept possession of the territories of the electors of Hesse and Hanover, and the Duke of Brunswick. Out of the countries just mentioned he created by decree of 18 August 1807 a kingdom of Westphalia, with an area of 14,712 square miles, and a population of nearly 2,000,000. Napoleon gave the kingdom to his youngest brother Jerome, and on 15 Nov. 1807 a constitution similar to the French was granted to it. The insurrections that broke out in several parts in 1809 occasioned the adoption of various severe measures, and the introduction of an oppressive system of police. At the same time the king was required to bring his army up to a strength of 30,000 men, which produced great disorder in the finances. In 1810 a part of Hanover was added to the kingdom, the whole area of which was now 17,540 square miles. After the battle of Leipsic (1813) the kingdom was dissolved. On 26 October Jerome was obliged to quit his capital (Cassel) and make his escape from the kingdom, whereupon the territories of which it was composed returned to their former possessors.

5. *The Prussian Province of Westphalia* was formed in 1815 out of some of the provinces which Prussia formerly possessed in the circle of Westphalia. It is bounded on the north by the province of Hanover; on the east by Hanover,

Schaumburg-Lippe, Lippe-Deinold, Brunswick, Hesse-Nassau, and the principality of Waldeck; south by the province of Hesse-Nassau; and west by the province of the Rhine and the kingdom of Holland. Its area is 7,800 square miles. The capital is Münster. The province in the south and northeast is generally mountainous, being traversed by the Westerwald, Rothaar, Teutoburgerwald, and the Wesergeburge. The northwest spreads out into extensive and often marshy plains, and belongs to the basin of the Ems; the northeast and a small part of the east to the basin of the Weser; the remainder, constituting the far larger portion of the whole, belongs to the basin of the Rhine. The soil is in general far from fertile. Live-stock are numerous, particularly horned cattle, sheep, and swine; the hams made from the latter have long been famous. The staple manufacture is linen, but that of iron is also very extensive. Besides iron and coal in abundance the minerals include copper, lead, zinc, and salt. The province is divided into the three governments of Münster, Minden, and Arnberg.

Westphalia, Peace of, the treaty concluded in 1648 at Münster and Osnabrück, Westphalia (q.v.), which ended the Thirty Years' war, and established a new political system in Europe. After preliminaries had been settled at Hamburg toward the end of 1641 the actual negotiations were begun in 1644, at Osnabrück, between the empire, Sweden, and the Protestant states, at Münster between the empire, France, and other foreign powers. Two treaties were drawn up, one at Osnabrück, signed 6 Aug. 1648, and one at Münster, signed 24 Oct. 1648. Peace was restored with the signing of the latter. By this peace the religious and political state of Germany was settled. The sovereignty of the members of the empire was acknowledged. They received the right of concluding treaties among themselves and with foreign powers, only not against the emperor and empire. Their consent was made necessary to enable the emperor to put any of the members under the ban. The concessions that had been made to the Protestants since the religious peace in 1555 were confirmed. The form of public worship and the right to secularized ecclesiastical benefices were to return to what they were at the beginning of the so-called normal year 1624. The Calvinists (Reformierten) received equal rights with the adherents of the Augsburg Confession or the Lutherans. The elector-palatine had the palatinate of the Rhine and the electorate restored to him; Alsace was ceded to France; Sweden received Western Pomerania, Bremen, Verden, Wismar, and a sum equal to \$3,750,000; Brandenburg, Mecklenburg, Hanover, and Brunswick were compensated by the secularization of numerous ecclesiastical foundations. Germany lost altogether more than 40,000 square miles of territory, and about 4,500,000 inhabitants. The independence of the United Provinces was recognized by Spain, and that of Switzerland by the empire. The solemn protest of Pope Innocent X. against these terms, particularly in respect of the secularization of bishoprics and abbeys, etc., was not regarded; but the complete execution of the treaty was obstructed by many difficulties.

Westport, Conn., town in Fairfield County; on Long Island Sound at the mouth of the Saugatuck River, and on the New York, New

Haven & Hartford Railroad. It was established from portions of the towns of Weston, Fairfield, and Norwalk. Westport contains three villages. It is in an agricultural region, and has a number of industrial establishments, chief of which are cotton-twine and button factories, machine shops, and manufactories of satchels and morocco. It has a high school, elementary schools, and a public library. There are two banks. The national bank has a capital of \$100,000, and the combined deposits are (1903) \$268,000. Pop. (1890) 3,715; (1900) 4,017; (1910) 4,259.

Westwood, John Obadiab, English entomologist and archaeologist; b. Sheffield, England, 22 Dec. 1805; d. Oxford, England, 2 Jan. 1893. He devoted himself to sciences, making extensive researches in the fields of entomology and archaeology; was one of the founders of the Entomological Society of London in 1833, and from 1883 its honorary life president. From 1861 until his death he was professor of invertebrate zoology at Oxford. His works on both entomology and English archaeology are numerous and important. Among the former are: 'The Entomologists' Text-Book' (1838); 'Introduction to the Modern Classification of Insects' (1839-40); 'Arcana Entomologica' (1843); 'Butterflies of Great Britain' (1843); 'Orthoptera' (1843); 'Phasmid' (1843); 'Oxonien' (1843); 'milia' (1843); 'His archaeological works, which are enriched by his excellent reproductions of manuscripts and illuminations and also by his drawings of inscribed stones and old ivories, are well known. Among them are 'Palaeographia Sacra Pictoria' (1843-5); 'Wood Carvings' (1864); 'The Utrecht Psalter' (1874); 'The Early Inscribed and Sculptured Stones of Wales' (1876-9); 'The Book of Kells: a Lecture' (1887); etc.

Wet Bulb Thermometer. See **Thermometer**.

Wetherell, wēth'ēr-ēl. Elizabeth. See **WARNER, SUSAN**.

Wethersfield, wēth'ēr-z-fēld, Conn., town Hartford County; on the Connecticut River, and on the New York, New Haven & Hartford Railroad; three miles south of Hartford. In the summer it has regular steamer connections with New York and intermediate ports, and it is connected with Hartford and other near-by places by electric railways. It has manufactories of mattresses, copying presses, and agricultural implements. Important industries of the town are connected with the cultivation of seeds and the packing and shipping of the same. A historic building is the Webb house, where, in 1781, Washington and Rochambeau met. A State prison is located here. The educational institutions are a high school, public and private schools and a public library. Pop. (1890) 2,271; (1900) 2,637; (1910) 3,148.

Wetmore, Claude Hazeltine, American author; b. Cuyahoga Falls, Ohio, 1862. He was educated at Western Reserve University, Cleveland, Ohio, and the Ecole Polytechnique, Lausanne, Switzerland, and subsequently spent ten years in South American travel. He has published 'Sweepers of the Sea' (1900); 'Fighting under the Southern Cross' (1901); 'In Inca-land' (1902); 'In a Brazilian Jungle' (1903).

Wetter, vē't'ēr, Sweden, a lake about 24 miles southeast of Lake Wener, extending between the läns of Mariestad, Örebro, Länköping, and Jönköping; greatest length, 80 miles; medium breadth, about 15 miles; area, 715 square miles. Its height above the level of the Baltic is nearly 300 feet, but its depth is in some parts above 400 feet, or 120 feet below the Baltic level. Its water is very clear. It has periodic rises and falls independent of the wetness or dryness of the season, and is subject, even in the calmest weather, to violent underground swells. When these take place in winter the sounds emitted by the ice in cracking and breaking up are often tremendous. An underground ridge is traceable throughout the whole length of the lake from north to south, and its culminating points form the few islands which appear above its surface. The largest of these is the Visingsö, in the south. The Wetter forms part of a general line of navigation, which extends across the kingdom from east to west, and far into the interior. By the Gotha Canal it communicates with Lake Wener, and by the Motala Canal with the Baltic. The scenery of the lake is in many places magnificent; the chief town on its shore is Jönköping.

Wetterhorn, vē't'ēr-hörn ("peak of tempests"), Switzerland, one of the most striking peaks of the Bernese Oberland; has three summits—the west, called by the natives Haali-Jungfrau, 12,147 feet high; the middle, known as the Mittelhorn, 12,165 feet; and the east, the Rosenhorn, 12,110 feet. These were ascended first in 1844 and frequently since, the ascent being made from Grindelwald. The contrast between the bright fresh pastures and the black precipices and dazzling snow ridges of the Wetterhorn is particularly striking, making the valley of the Reichenbach a favorite resort of artists.

Wexford, wēks'fōrd, Ireland, a seaport town, capital of the county of the same name, at the mouth of the river Slaney. The town is irregularly built, and the streets narrow, but it contains some handsome buildings. It has a county court-house, town-hall, prison, theatre, barracks, etc.; three Roman Catholic churches, besides several Protestant places of worship, nunneries, a Roman Catholic college, and various schools. Above the town there is a bridge across the river 1,500 feet in length. Wexford was a Danish settlement of great strength; it was captured by Cromwell in 1649; remains of its ancient walls exist. The harbor is spacious, but has a bar across the mouth. There is a dockyard and patent slip. The herring and salmon fisheries employ many persons; malt, agricultural implements and machinery are manufactured, and distilling and brewing are carried on. The chief trade consists in the exportation of grain, cattle, poultry, butter, etc. In 1885 Wexford ceased to be a parliamentary borough.

Weyden, vī'dēn, Rogier van der, Flemish painter; b. Tournay about 1400; d. Brussels 16 June 1464. In 1426 he was apprenticed to learn painting, in 1432 became master in the painters' guild of Tournay, and in 1436 was chosen town artist of Brussels. His four works illustrating justice, executed for the "golden chamber" of the Hôtel de Ville, were destroyed by fire in 1603. In 1449 he journeyed to Italy, where he worked at Ferrara for Leonello d'Este, and painted also

WEYER'S CAVE—WHALE

for the Medici and the Storms. He was the founder of the Brabant school. Among his principal extant works are: A triptych in the Belvedere of Vienna; a triptych, 'The Last Judgment,' in the Beune Hospital; and 'The Descent from the Cross' (Madrid gallery). Consult the study by Wauters (1856); and Crowe and Cavalcaselle, 'Early Flemish Painters' (3d ed., 1879).

Weyer's (wē'ez) Cave, in Augusta County, Va., 11 miles northeast of Staunton. It is a large stalactitic cavern, in a spur of the Blue Ridge; and it contains a number of chambers, the largest of which is called Washington's Hall. This chamber is 250 feet long and nearly 100 feet high. This cave ranks next in importance to Mammoth and Wyandotte caves.

Weyler y Nicolau, wā'ler ē nē'kō-low, Valeriano, MARQUIS OF TENERIFFE, Spanish general: b. Palma, island of Majorca, 17 Dec. 1838. He was educated in Granada, entered the infantry school in 1853, and became under-lieutenant in the staff school in 1857. He was appointed lieutenant of the staff in 1860, and rose through higher ranks until in 1878 he became lieutenant-general. He was military attaché of the Spanish legation at Washington during the American Civil War, and in 1868 was ordered to Cuba, where he served under Balmaceda through the ten years' war. He was appointed governor-general of the Canaries in 1879, captain-general of the Philippines in 1889, and was afterward provincial governor of Catalonia. He succeeded Martínez Campos as captain-general of Cuba in 1896, and by the perpetration of many barbarities added to an already infamous record for cruelty in the conduct of the war then being waged on the island. His inhuman methods aroused the indignation of the people of the United States, where he became known as 'Butcher Weyler,' and in 1897, upon the change of cabinets in Spain, he was recalled. In 1901-2 he was minister of war in Sagasta's cabinet.

Weyman, wē'man, Stanley John, English novelist: b. Ludlow, Shropshire, 7 Aug. 1855. He was educated at Shrewsbury School and Christ Church, Oxford, studied law, and was called to the bar in 1881. For nine years he practiced on the Oxford circuit, and then began a literary career in 1890 by publishing a romance entitled 'The House of the Wolf.' It was succeeded by 'The New Rector' (1891) and 'The Story of Francis Cludde' (1891), but it was his brilliant story, 'A Gentleman of France' (1893), that first brought him into prominence, and on his historical novels his reputation rests. His later works include 'Under the Red Robe' (1894); 'My Lady Roths' (1894); 'The Red Cockade' (1895); 'The Man in Black' (1896); 'Shrewsbury' (1897); 'The Castle Inn' (1899); 'Sophia' (1900); and 'Count Hannibal' (1901). His tales are well constructed and written in a workmanlike manner, with plenty of incident and adventure, and the interest is well sustained.

Weymouth, wā'mūth, England, seaport in Dorsetshire, on a beautiful semicircular bay, seven miles south-southwest of Dorchester. The borough comprises Melcombe-Regis, from which it is separated by the small river Wey. It is well built; has two parish churches, one of them in Melcombe-Regis; several other places of worship, a general and an eye infirmary, town-hall,

reading-room, Victoria Jubilee hall, libraries, etc. There is a considerable coasting trade, and an active traffic, passenger and other, with the Channel Islands and France. There are ship-building, sail-making, and rope-making establishments. Portland stone is exported from the neighboring isle of Portland (q.v.). Both Weymouth and Melcombe-Regis, particularly the latter, from the beauty of the bay and its smooth, firm sands, attract numerous visitors. There is a fine esplanade about one mile in length. Pop. about 22,000.

Weymouth, Mass., town in Norfolk County; on Boston Harbor, and on the New York, New Haven & Hartford Railroad; 12 miles southeast of Boston. Electric lines connect the town with Boston and the near-by towns. Weymouth contains seven villages, each one having a post-office. It has manufactories for boots and shoes, hammocks, fireworks, and machinery. It has car-repair shops and extensive wool-scouring yards. The educational institutions are grammar and primary schools, private schools, Tufts Library, which contains about 20,000 volumes, the Fogg Library, and a high school at Weymouth Centre. The town owns and operates the water-works.

The first permanent settlement was made in 1623 by Capt. Robert George, but the place had been visited often before this time, notably in 1622 by Thomas Weston. The place was first called by the Indian name *Wemagusset*, until it was incorporated 2 Sept. 1635, when the present name was adopted. Pop. (1900) 11,324; (1910) 12,895. Consult Adams, 'Proceedings on the 250th Anniversary of the Permanent Settlement of Weymouth.'

Weyr, vir, Rudolf, Austrian sculptor: b. Vienna 22 March 1847. A pupil of Bauer and Cesar at the Vienna Academy, he won the Reichel prize with his 'Samson and Delilah' (1870), and in 1878 was commissioned to execute the decorations of the Grillparzer monument. His reliefs and experiments in polychrome sculpture won for him a considerable reputation. Besides numerous decorations for the university and museum buildings at Vienna, his works include the 'Triumphal Procession of Bacchus and Ariadne' for the pediment of the Burgtheater, and the great fountain before the Imperial palace.

Whale. Any large cetacean is called a whale, while any small representative of the order is usually called a porpoise or dolphin. This division of the group is unscientific, however, and breaks down when the moderate-sized forms are in question, the layman being always in doubt whether these are to be classified as whales or as porpoises.

It happens that all cetaceans having whalebone, instead of teeth, or those constituting the suborder *Mystacoceti*, are of large or huge size. These may be all quite properly called whales, but it will be necessary for the present purpose to add to this natural group the sperm whale, a representative of the toothed whales, or suborder *Odontoceti* and the bottlenosed, or ziphioid, whales, which constitute the family *Ziphiidae*, and also belong among the toothed whales. The order then stands as follows:

Order *Cetacea*. *Cetaceans*.

Suborder *Mystacoceti*. All cetaceans with whalebone.
Family *Botaniidae*. (Co-extensive with the suborder.)
Suborder *Odontoceti*. All cetaceans with teeth.

WHALE

Family *Physeteridae*. Sperm whales.
Family *Ziphiidae*. Bottlenosed whales.
Family *Delphinidae*. Porpoises or dolphins.
Family *Platanistidae*. River dolphins.

Whalebone Whales.—Whalers recognize several species or groups of whales with whalebone, to which they give the names of right whales, humpbacks, finbacks and sulphurbottoms. These correspond to natural groups or genera, except that the sulphurbottom is really a kind of finback. To these are to be added the California gray whale, or grayback, a very distinct genus, combining characters of right whales and finbacks, and the pygmy right whale of New Zealand. These various genera may be distinguished by the following external characters:

Humpbacks (genus *Megaptera*).—Form bulky and uncouth. Head broad and rounded in front, and flat on top, with rows of hemispherical tubercles. Belly with many broad longitudinal ridges and furrows. Pectoral fins very long (about one third the length of the body), with serrations corresponding to the joints of the index finger. A low, thick dorsal fin. Flukes with a serrated margin. Color black and white. Whalebone short, dull blackish.

Finbacks (genus *Balaenoptera*).—Form slender and graceful. Head broad and flattish, more or less pointed in front. Belly with very numerous narrow ridges and furrows. Pectoral fins short, with plain margins. A falcate dorsal fin. Color gray and white. Whalebone short, striped gray and white, or entirely black, or black with white bristles, or entirely white.

California Gray Whale (genus *Rhacianectes*).—Form rather slender. Head comparatively narrow, moderately arched and pointed. No abdominal ridges or furrows, but two short furrows on the throat. No dorsal fin. Pectorals short. Color mottled gray. Whalebone short, white.

Right Whales (genus *Balana*).—Form heavy and compact. Snout very narrow, and strongly arched. No ridges or furrows. No dorsal fin. Pectorals short and very broad. Color entirely black, or with a little white below. Whalebone very long, narrow, black.

Pygmy Right Whale of New Zealand (genus *Neobalana*).—Similar to *Balana*, but size small. A dorsal fin present. Whalebone white.

Humpbacks.—The humpback is in many respects the most remarkable of all whales. It reaches a length of about 50 feet. The anterior part of the body is very massive, but the posterior quite slender and at the same time so irregularly shaped and so awkwardly joined to the thorax that the animal appears misshapen. This effect is heightened by the dorsal fin, which is low and thick, with a concave anterior margin, and rounded tip. Not less striking are the immense crenate-margined pectoral fins, like the wings of a bird, and about one third as long as the body. The broad abdominal ridges nearest the median line join below on the throat, forming a chin-like protuberance. Humpbacks are infested by large barnacles of the genus *Coronula*, which fasten on the head, fins, flukes and abdominal ridges. Where they settle on the black skin but are afterward rubbed off, or otherwise got rid of, they leave behind distinct white marks, in the form of disks, circles, crescents, etc., which add to the singular appearance of these whales. Fastened to the large barnacles, are often bunches of

stalked barnacles, genus *Onion*, which hang down like fringes on the fins. Some nine or ten species of humpbacks have been described, but wherever observed they present characters so nearly alike that it is extremely probable that all belong to one widely-diffused species. The species of the Atlantic coast of North America and Europe is *Megaptera nodosa*. Humpbacks occur in all seas, from the Arctic to the Antarctic. They congregate in bands, or schools, which sometimes number hundreds or even thousands of individuals. They are very irregular in their movements and indulge in all manner of uncouth actions. When they dive or sound they throw the flukes out of the water. Like other cetaceans they engage in seasonal migrations northward and southward. In the North Atlantic they withdraw from the waters of Greenland, Newfoundland, Iceland, and Norway in fall and return in spring. They feed chiefly on fish.

Sulphurbottom, or Blue Whale (*Balaenoptera musculus*).—The sulphurbottom, as already stated, is a species of finback. Wherever finbacks are observed there are found to be four distinct forms. Each of these has been described from different localities under different names, but the variations are slight in each case, and have never been fully established, so that there is a strong probability that there are but four cosmopolitan species. These are the sulphurbottom, the common finback, the pollack whale, and the little piked whale. Each form will now be considered separately, beginning with the sulphurbottom. The sulphurbottom is the largest of whales and the largest of all animals now existing, and was probably not surpassed in size by any animal living in earlier geological times. The largest individual of which there are authentic measurements was 88½ feet long. The average length for adults is about 76 feet. The sulphurbottom has a massive head and broad snout, and the body tapers gradually to the flukes. The dorsal fin is falcate and less than a foot high, and is situated at a point a little more than three fourths the distance from the tip of the snout to the notch of the flukes. The pectoral fins are falcate and about 7½ feet long, from the axilla. In color the sulphurbottom is gray, nearly uniform on the head, but mottled on the back and sides. On the belly are numerous white spots. The pectoral fins are gray above and white below, the flukes gray on both sides, and the dorsal fin also gray, sometimes with a whitish centre. The abdominal ridges number 62 to 88. The whalebone is about three feet long, broad at the base, and black in color, both plates and bristles. These huge whales feed exclusively on small crustaceans, the species in the North Atlantic being the thysanopod *Euphausia inermis*. The sulphurbottoms congregate in the bays of southern Newfoundland, Iceland, and northern Norway in early spring and remain until about July. Some individuals, however, appear to remain throughout the year, and their migrations are irregular and not well understood. They rarely strand on the east coast of the United States, nearly all the individuals reported as such belonging to the next species, the common finback.

Common Finback (*Balaenoptera physalus*).—This is the most commonly observed and best known of the finbacks. In size it ranks next to

WHALE

the sulphurbottom. The form is exceedingly attenuated. Adult individuals reach an average length of 65 feet. The head is narrow anteriorly. The dorsal fin exceeds a foot in height and is situated as in the sulphurbottom. The pectoral fins are small, somewhat triangular, and about 5 feet long, from the axilla. This whale is gray on the back and upper surfaces of the pectoral fins and flukes, and white on the belly and the under surfaces of the pectoral fins and flukes. The whalebone as a whole is gray, striped longitudinally with white, but at the anterior end of the jaw on the right side the whalebone is all white. The outside of the right lower jaw is also white. These parts are dark on the left side. This singular asymmetry of coloration is peculiar to, and characteristic of, the species. The common finback feeds on various kinds of small fish, especially the capelin, herring, young cod, etc.

In the North Atlantic it appears in spring in Massachusetts Bay, the Gulf of Maine, about Newfoundland, and in Greenland waters, as well as on the coasts of northern Europe. In the fall it withdraws from these waters and is supposed to migrate southward. The large whales which strand on the east coast of the United States are almost invariably of this species. When swimming or rising to spout, this whale, like the sulphurbottom, shows the top of the head and back and the dorsal fin, but nothing beyond. The flukes are not thrown out of the water when it dives or sounds.

Pollack Whale, or Rudolph's Rorqual (Balænoptera borealis).—This is a smaller whale than either of the preceding, adults reaching a length of about 45 feet. The form is more compact, the dorsal fin larger and more anteriorly placed. It is black on the back and sides, with a restricted gray or whitish area on the belly. The pectoral fins and flukes are dark gray, both above and below. The whalebone plates are black, but the bristles white. This whale, like the sulphurbottom, feeds on small crustaceans. Although large numbers of individuals were taken on the northern coast of Norway in some years when the fishery was at its height, it appears to be less abundant than the larger species. It was not positively known to occur on the east coast of North America until 1903, when four specimens were taken at the Newfoundland whaling stations. It cannot yet be considered more than a straggler in American waters. A similar, or identical, species has been observed in the Pacific Ocean, but little is known regarding it.

Little Piked Whale, or Lesser Finner (Balænoptera acuto-rostrata).—This is the smallest of the finbacks, and is not sought for by whalers. The form is thickset like that of a porpoise, and the head pointed. When adult, it is about 25 feet long, and the maximum length is about 28 feet. The dorsal fin is larger than in any of the other finbacks, and is situated farther forward, or at a point only about two thirds the distance from the tip of the snout to the notch of the flukes. It is very dark gray or blackish on the back and sides, and white on the belly, a little clouded with gray. The pectoral fins are blackish above, with a broad cross-band of white near the middle; below they are white. The flukes are blackish above and whitish below. In this species the abdominal ridges are very numerous and narrow. The whalebone

is very short and entirely white. The little piked whale feeds upon fish. It is found with the other species of finbacks in the North Atlantic, migrating northward and southward in the same manner, according to the season. A few specimens have been observed on the coast of New England, New York, and New Jersey, either stranded, or entangled in the nets of the fishermen. Whales of the same size and form, and with the same peculiar markings, have been observed on the coast of New Zealand, Argentina, Washington, Alaska, and in other widely separated localities.

California Gray Whale, Grayback or Devil-fish (Rhachianectes glaucus).—This remarkable whale is found only in the North Pacific. Its characters have been already enumerated above. When full-grown it has a length of about 40 feet. It is a restless and sagacious animal, and when wounded frequently attacks the boats sent out for its capture. In earlier days it was found abundantly in the winter months in the lagoons and bays of Lower California whither it repaired to breed. It is fond of playing in the surf and approaches close inshore to indulge in this recreation without fear of stranding. The gray whale is found as far northward as Bering Sea, and occurs also on the coast of Japan, but has no counterpart in other seas.

Greenland Right Whale, Arctic Right Whale, or Bowhead (Balæna mysticetus).—In reviewing the observations of earlier zoologists, Cuvier came to the conclusion that but one species of right whale existed in the North Atlantic and Arctic oceans, an erroneous opinion, which nevertheless was accepted until the Danish cetologist Eschricht proved that the right whale of the Arctic was quite distinct from the species occurring farther south. This Arctic right whale, or bowhead, as it is called by American whalers, is most remarkable in appearance. The snout is narrow and arched like a bow. From the roof of the mouth depends the extraordinary, narrow black whalebone, which may be 12 feet long or even longer. This whalebone is enclosed and protected by the immense oblong lower lip, the curved upper edge of which fits against the side of the upper jaw when the mouth is shut. The back is without a fin, while the pectorals are short and broad. There are no ridges or furrows on the belly. Adults reach a length of about 60 feet. The bowhead rarely or never leaves the Arctic ice, but like other whales it migrates northward and southward with the changes of the seasons. On the east coast of America it is never seen as far south as the southern extremity of Greenland, though there is a tradition that at the time of the discovery of the country it ranged as far south as the Strait of Belle Isle in winter. It occurs in the Arctic Ocean north of Alaska and ranges southward into Bering Sea. Individuals are believed to pass back and forth through the channels between the islands north of the continent from the eastern to the western side. The bowhead feeds chiefly on small pteropod mollusks and crustaceans which occur in vast multitudes in the Arctic Ocean. It is the most valuable of whales from a commercial point of view, on account of the thickness of the blubber and the length and fine quality of the whalebone, which at present commands exceedingly high prices. Its constant pursuit for three cen-

WHALE

turies has now very greatly diminished its abundance.

Atlantic Right Whale, or Black Whale (Balena glacialis).—This whale resembles the bowhead in general appearance, but the head is smaller and less arched, and the whalebone shorter, or only about seven feet long. Near the end of the snout is a low rounded protuberance, called the "bonnet" by whalers. This bonnet is covered with barnacles, which are not found adhering to the bowhead. The black whale, as its name implies, is usually entirely black, but some individuals have been reported as whitish or grayish on the throat and breast. When full-grown it reaches a length of about 50 feet. Like the bowhead it feeds upon crustaceans and pteropod mollusks. The species has been nearly exterminated, but in former days it appeared regularly in the bay of Biscay in winter and migrated northward to Iceland and northern Norway in spring. On the North American coast it ranges, or did range, as far south as Georgia in winter and toward the close of that season, or in early spring, appeared in Delaware Bay and off the coast of Long Island and Massachusetts, and later in the Gulf of Saint Lawrence. A few individuals still appear quite regularly off Long Island.

There is every reason to believe that this whale was the object of pursuit of the earliest whale fishers among the Basques in the Bay of Biscay in the Middle Ages. It was the species on which the American Colonial shore whale-fishery was based. So persistently was it pursued, however, that for many years it was supposed to be extinct and no remains which could be identified with it were to be found in any museum. Within the last 25 years, a few individuals have appeared every spring off the east coast of the United States, and a few have been captured, or have stranded, on the coasts of southern Europe and Iceland. As the right whale does not occur within the tropics, it has been questioned whether the large species observed about New Zealand, in the North Pacific and in other waters is the same as that of the North Atlantic. Opinion is at present divided on the subject, but it is generally conceded that the real differences between the right whales of the northern and southern temperate seas, if any, have yet to be pointed out. The Atlantic right whale, like the bowhead, feeds upon pteropod mollusks and crustaceans.

Pygmy Right Whale of New Zealand (Neobalena marginata).—This is a remarkable little whale, resembling the large right whales, but reaching a length of only about 20 feet. It has a small dorsal fin, but no abdominal ridges or furrows. The whalebone is long and white. In color the whale is black, with a line of white along the belly. It has many osteological peculiarities, among which one of the most striking is the flatness and breadth of the ribs, of which there are 17 pairs. The lumbar vertebrae are only two in number. Little is known of the habits of this whale.

Sperm Whale (Physeter macrocephalus).—This whale, as already stated, belongs to the *Odontoceti*, or toothed whales, one of the two main divisions of the order Cetacea, which includes also the porpoises, river-dolphins, and bottlenosed or beaked whales. But one species of sperm whale is known. When full-grown the male reaches a length of 60 or 65 feet, but the

female is much smaller. The head is of immense size, and is shaped like an elongated wedge with the base uppermost, and the edges and free end rounded. The blowhole is single and situated at the end of the snout on the left side. The lower jaw is very narrow and much shorter than the upper, and the two sides are joined together anteriorly for about one half the length. In it are implanted about 44 large conical teeth which fit into pits in the upper jaw when the mouth is closed. There are no teeth in the upper jaw. The back is without a fin, but is raised into a number of low irregular humps posteriorly. The pectoral fins are broad and about six feet long. In color the sperm whale is blackish above and somewhat mottled with gray below. It occurs in all seas except the Arctic and Antarctic, but is essentially an animal of the tropics. The herds or schools are diversified in character, some comprising only young bulls, other females and young led by an old bull, etc. At times old bulls are encountered wandering singly or in small groups. These old males are ill-tempered and pugnacious, and do not hesitate to attack the boats of the whalers. The sperm whale feeds upon large cuttlefish, which its great strength and powerful under-teeth are supposed to enable it to dislodge from their rocky retreats at the bottom of the sea.

Bottlenosed Whales, or Beaked Whales (family Ziphiidae).—This family comprises four or five genera of small whales, none of them exceeding about 30 feet in length. Several species of each genus have been described, but many of them appear to be without a certain foundation. Like the sperm whale, they belong to the sub-order *Odontoceti*, or the toothed whales. They never have, however, more than four teeth regularly implanted in the jaws, but some species have numerous minute rudimentary teeth imbedded in the lips. The head of all the forms, at least in the young, is pointed, the dorsal fin low and placed far back toward the flukes, the pectoral fins narrow, and of moderate length. In the bottlenosed whale of the North Atlantic (*Hyperoodon rostratum*) the forehead gradually increases in size with age, until it is sharply marked off from the narrow beak, like the shoulder of a bottle. This species congregates in large herds and is eagerly sought by whalers for its oil. The beaked whales of the remaining genera, *Mesoplodon*, *Berardius*, and *Ziphius*, are far less abundant. They travel in pairs. *Hyperoodon* is peculiar to the North Atlantic, *Berardius* occurs only in Bering Sea and about New Zealand, while *Mesoplodon* and *Ziphius* appear to be cosmopolitan genera. The beaked whales subsist upon cuttlefish.

Spermaceti.—Spermaceti is the solid constituent of the crude oil of the sperm whale and some other cetaceans. The head of the sperm whale, between the skull and the integuments, is a kind of large reservoir of a semi-solid "head-matter" rich in spermaceti, but the substance is also contained in the oil of other parts of the body and especially the dorsal hump. To extract the spermaceti, the oil is boiled, chilled and afterward submitted to a heavy pressure. The crude brown spermaceti is refined by heating and bleaching with alkali. Spermaceti is a whitish, translucent substance, a little lighter than water, and soluble in chloroform, ether and carbon bisulphid. It melts at

WHALE-BIRD — WHALING

about 125° F. Though an excellent substance for candles, it has been very largely supplanted for that purpose by paraffin and other low-priced materials. The production in the United States in 1901 amounted to 400,000 pounds, valued at \$100,000.

Whalebone.—Whalebone is the outgrowth of horny substance from the epidermis of the upper jaw in whales of the family *Balaenidae*. It takes the form of triangular plates, which differ greatly in size, proportions and color in different species. Plates to the number of 200 or 300 are attached by their bases transversely to the roof of the mouth on each side. They are longest in the middle of the series and at the ends become mere bundles of fibres. The plates are smooth and straight on the outer edge, but the inner edge is fringed with coarse bristles. The bristles of adjoining plates become matted together, forming a strainer by which the whale is enabled to retain in its mouth the fish or small crustaceans, etc., on which it feeds, while the water is squeezed out through the plates by the action of the tongue. In the right whales, the humpback and the sulphurbottom, the whalebone is black or blackish; in the common finback striped gray and white; in the pollack whale, black with white bristles; and in the little piked whale, the California gray whale and the pygmy right whale of New Zealand, yellowish-white. The most valuable whalebone commercially is that of the right whales, and especially that of the bowhead, which may have a length of from 10 to 12 or even 15 feet, and is very flexible. A single bowhead yields 2,000 pounds of whalebone, valued at from \$5 to \$7 a pound.

Whalebone from the humpback, sulphurbottom and finback is short, coarse and brittle, but also enters into commerce. Whalebone is used in the manufacture of corsets, in stiffening and adding gloss to certain kinds of cloth, for surgical instruments, whips, etc.

F. W. TRUE,

United States National Museum.

Whale-bird. See FULMAR.

Whale-head, a stork. See BALENICEPS.

Whale-louse, any of various small crustaceans parasitic on whales. (See FISH-LICE.) These crustaceans have a rudimentary abdomen, and have the limbs of the first joint of the thorax or chest inserted beneath the throat. The body is flattened and of oval shape, and the legs are all prehensile. They burrow deeply into the skin of their hosts.

Whale Oil. The use of whale oil appears to be of ancient origin. It was doubtless first obtained from whales accidentally stranded on the shores, a more frequent occurrence during the early abundance of the cetaceans than at present, when their numbers have been so greatly reduced by excessive fisheries. As the demand for the oil increased beyond the supply available from stranded whales, individuals sighted from the shore were attacked and beached. Owing to the frailty of the boats and equipment, this was a more daring attempt than might be supposed. Just prior to the Revolutionary War there were 183 American vessels in the right-whale fishery of the North Atlantic waters, and 125 were engaged in cruising for sperm whales from Newfoundland to the coast of Brazil. The Revolutionary War and the War of 1812 interfered with the fisheries;

but during the period of peace following 1815 they increased greatly in extent until 1846, when the fleet numbered 678 ships and barks, 35 brigs, and 22 schooners, a total of 735 vessels, with an aggregate tonnage of 233,189 tons, and a value of \$21,075,000, exclusive of outfits and supplies. The entire capital invested in the fishery and its associated industries at that time approximated \$40,000,000, and 40,000 persons derived from it their chief support. During the same year the whaling fleet of all Europe numbered but 230 vessels. The crude value of the American catch from 1840 to 1860 averaged about \$8,000,000 annually. The greatest value was in 1854, when 2,315,924 gallons of sperm oil worth \$1.48½ per gallon, 10,074,866 gallons of whale oil worth 59½ cents per gallon, and 3,445,200 pounds of whalebone worth 39 1-5 cents per pound were secured, the total value being \$10,802,594. In the preceding year, 1853, the total product was 3,246,925 gallons of sperm oil 8,193,591 gallons of whale oil, and 5,652,300 pounds of whalebone, the whole valued at \$10,766,521. Sperm oil and whale oil then served nearly all the diversified uses for which oil was required, the chief exception being leather-dressing, for which neatfoot and cod oils were largely employed. The principal uses were as illuminant, lubricator, in cordage manufacture, screw-cutting, and steel-tempering. The streets of the principal cities were lighted with the oil, and theatres and public buildings were lighted with gas made from the foets.

In 1902 the whaling fleet of the United States consisted of 8 steamers, 18 barks and brigs, and 12 schooners, aggregating 8,366 tons. Of these, 11 barks and 10 schooners were sperm-whale fishing in the Atlantic Ocean, 8 steamers in the Arctic, 6 barks in Okhotsk Sea and off the coast of Japan, 2 schooners in Hudson Bay, and 1 brig at Desolation Island. The total whale-oil product of the world at present approximates 3,000,000 gallons yearly, of which 750,000 gallons are produced by the United States fisheries, 900,000 by those of Norway, and the remainder by Scotland, Russia, Japan, Newfoundland, etc.

The following tabulated statement of the yield of oil from the several species of cetaceans has been prepared after consultation with the most experienced whalers of various ports:

	Yield of oil in barrels of 31½ gallons	
	Variations	Average
Right whale, Pacific.....	25 to 250	90
Right whale, Atlantic....	25 150	75
Bowhead	30 250	100
Sperm whale	5 145	45
Humpback, Pacific.....	10 110	48
Humpback, Atlantic ..	10 100	40
Finback, Pacific.....	10 70	35
Finback, Atlantic.....	20 60	38
California gray whale....	15 60	30
Bottle-nose whale	4 25	12
Orca or killer whale....	1 6	2½
Beluga or white whale...	¾ 3	1½
Black-fish	¼ 4	1½

Whaleback Steamship. See STEAM VESSELS.

Whalebone. See WHALING.

Whaling, or the pursuit of whales as an industry, originated in Europe at a remote period. There are obscure references to it

WHALLEY

among the Norwegians and English as early as the beginning of the 10th century. As early as the 11th century the Basques pursued the North Atlantic right whale, or black whale, (*Balaena glacialis*), with harpoons, in open boats. It is even asserted that they crossed the Atlantic in pursuit of their quarry before the time of Columbus, but this has not been substantiated. Certain it is, however, that they visited Newfoundland immediately after the discovery of America and captured the same species of right whale in those waters. They are supposed also to have first seen the Arctic right whale, or bowhead (*Balaena mysticetus*), in the Strait of Belle Isle. In 1607 Henry Hudson encountered the bowhead in the vicinity of Spitzbergen. The Spitzbergen fishery developed rapidly on account of the large amount of oil yielded by this species, and was extensively engaged in by various European nations, especially the Dutch who in 1680 employed 260 vessels and about 14,000 men in the industry. During the decade beginning 1679, the Dutch took an average of about 1,000 whales annually. As the bowheads decreased about Spitzbergen, they were sought for to the westward, and in 1719 a Dutch vessel first entered Davis Strait. This fishery was developed chiefly by the British, Danes, and Americans. In 1789 there were 255 British vessels engaged in it. The first American vessel visited Davis Strait in 1732. The number increased rapidly and at the height of the fishery, just before the Revolutionary War, Massachusetts alone sent 183 vessels to the strait.

About 1670, the American colonists succeeded in establishing a boat shore-fishery for the Atlantic right whale, which in those days was abundant on the coast, especially off Long Island and in Delaware Bay, and was well known from a much earlier date through stranded individuals. Later the colonists pursued it in sailing vessels farther from shore and in the Gulf of Saint Lawrence, but finally turned their attention to the Arctic right whale, or bowhead, in Davis Strait, as already mentioned.

About 1712 the first sperm whale was captured at sea by a Nantucket whaler. This fishery rapidly rose in importance and was pursued in all quarters of the globe, especially by the Americans. The British did not apply themselves to it until 1775, but in 1790 a British whaling vessel rounded Cape Horn and opened up the Pacific fishery, which immediately grew to enormous proportions, and was at its height in 1837. The American whaling fleet in 1839 comprised 555 vessels, of which the majority were engaged in the Pacific sperm-whale fishery. In 1847 the number rose to 594, while the foreign whaling fleet numbered 230 vessels. The size of the American fleet reached its maximum in 1846, when 729 vessels were employed.

While a large part of the American fleet was engaged in the pursuit of the sperm whale, the remaining vessels were chiefly employed in hunting right whales, especially in the North Pacific. As the sperm-whale fishery declined, this branch increased in importance. In 1835 the famous Kadiak ground was discovered. A new epoch opened in 1843 when bowhead whales were first taken off the Kamchatka coast. In 1848 the first vessel passed through Bering Strait to pursue these large whales in the Arctic Ocean. The fishery in the North Pacific and adjoining Arctic was at its height in 1852, when 278 vessels were

employed. In 1866 the first American steam whaling-vessel was brought into use, and in 1880 two steamers were added to the Pacific-Arctic fleet.

The introduction of mineral oils for illuminating and other purposes, and the decrease in the abundance of whales, gradually broke down the fishery for right and sperm whales and at the present time the number of vessels engaged in the industry is but a handful compared with the fleets of former days. A few sailing vessels still pursue the sperm whale, but in 1902 only five British vessels (steamers from Dundee, Scotland), entered Davis Strait in pursuit of the bowhead. The American whaling fleet in 1902 comprised 38 vessels, including eight steamers engaged in the Pacific-Arctic bowhead fishery. Of the remaining 30 sailing vessels, 21 engaged in sperm whaling in the Atlantic; six visited Okhotsk Sea and the coast of Japan, two entered Hudson Bay, and one remained about Desolation Island. Whale-oil has greatly declined in value, but the whalebone of the bowhead, which in earlier days was worth only a few shillings a pound, now brings from five to seven dollars a pound. As a single bowhead yields 2,000 pounds or more, the profit from even a single whale is large.

The humpback whale was always pursued to some extent by right-whale whalers, but the finbacks and sulphurbottoms, besides furnishing a relatively small amount of oil, were too swift to be attacked successfully with hand-harpoons. About 1865, however, Svend Foyn, a Norwegian fisherman, invented a method of shooting them with a combined harpoon and bomb fired from a swivel gun mounted at the bow of a small steamer, and for 30 years large numbers of sulphurbottoms, finbacks, and humpbacks were killed annually at stations established on the coast of Finnmark. Later the same method was employed at Iceland, The Farøe and Shetland Islands, and also about Japan. In 1898 this mode of whaling was introduced into Newfoundland, where several hundred sulphurbottoms, common finbacks and humpbacks are now killed annually.

A considerable number of common finbacks and humpbacks have been killed in Massachusetts Bay and the Gulf of Maine during the last 25 years by means of explosive bombs attached to a special form of hand-harpoon, called a "darting gun." A boat-fishery of limited extent has been in existence for many years on the coast of California. It has for its object the capture of the California gray whale, and the humpback, which are killed by harpoons fired from a swivel gun mounted at the bow of a whale boat. Similar boat-fisheries exist on the coast of New Zealand, in the West Indies, and in other parts of the world.

Whalley, hwô'l, Edward, English regicide: b. England about 1620, d. Hadley, Mass., about 1675. He was in trade, probably that of woolen-draper, at the outbreak of the Civil War, when he enlisted for Parliament. In 1643 he became major in Cromwell's regiment of horse, and in 1644 after having fought at Gainsborough and Marston Moor, appears as a lieutenant-colonel. He was made colonel of one of the two parts into which Cromwell's regiment was di-

WHARTON—WHARVES AND WHARF CONSTRUCTION

vided, and with this force took Banbury and Worcester. Later, he was superseded. After Charles I. was seized, Whalley was ordered to take charge of the king, and in that post displayed much tact. He sat for Nottinghamshire in the two parliaments assembled by Cromwell, and in 1657 was made a member of the new House of Lords. He went to Scotland as agent of the army to mediate with General Monk, but had no success. On the Restoration he did not obey the summons of surrender of the king's judges, and was therefore excluded from the indemnity. He sailed with William Goffe (q.v.) for New England, arrived at Boston 27 July 1660, resided for a time in Cambridge, but when the act of indemnity reached Boston in November and the town council met (February 1661) to consult regarding the refugees, went with Goffe to New Haven, where they arrived 7 March. He was associated with Goffe in the subsequent wanderings and concealments which have lent such interest to their history. Consult. Stiles, 'History of Three of the Judges of Charles I.' (1704); Noble, 'Lives of the Regicides' (1798); Hutchinson, 'History of Massachusetts' (3d ed. 1795); and the 'Collections' of the Massachusetts Historical Society, 3d ser. I. 60, 4th ser. VIII. 122. Mrs. H. M. Lothrop's romance 'The Judges' Cave' (1901) is founded on incidents in the New England career of Goffe and Whalley.

Wharton, hwar'ton, Anne Hollingsworth, American author: b. Southampton Furnace, Pa., 15 Dec. 1845. She has written mainly though not entirely upon colonial themes and among her books are: 'The Wharton Family' (1880); 'Through Colonial Doorways' (1893); 'Colonial Days and Dames' (1894); 'A Last Century Maid' (1895); 'Martha Washington: A Biography' (1897); 'Heirlooms in Miniature' (1897); 'Salons Colonial and Republican' (1900); and 'Social Life in the Early Republic' (1902).

Wharton, Edith Jones, American novelist: b. New York 1862. She was privately educated and was married to Edward Wharton in 1885. She has since resided much abroad, and has published 'The Greater Inclination' (1899); 'The Touchstone' (1900); 'Crucial Instances' (1901); 'The Valley of Decision' (1902); 'Sanctuary' (1903); 'The Descent of Man' (1904); and 'The House of Mirth' (1905); besides 'The Decoration of Houses' (with O. Codman 1897), a rendering of Sudermann's 'Es Lebe das Leben' as 'The Joy of Living' (1902), and some uncollected stories, articles, and verse.

Wharton, Francis, American jurist: b. Philadelphia, Pa., 7 March 1820; d. Washington, D. C., 21 Feb. 1889. He was graduated at Yale in 1839, studied law, and was admitted to the bar in 1843. He was professor of logic and rhetoric in Kenyon College, Ohio, 1856-63; in 1863 took orders in the Episcopal Church and became rector of Saint Paul's, Brookline, Mass. In 1866 he became a professor in the Episcopal Divinity School at Cambridge, Mass., and also held the chair of international law in the Boston Law School. In 1885 he was appointed counsel for the State Department at Washington, and under a resolution of Congress (1888) was made editor of the Revolutionary diplomatic correspondence of the United States. His best known work is a 'Treatise on the Criminal Law of the

United States' (1846), which is accepted as a standard and has passed through many editions. Other works of his are: 'Precedents of Indictments and Pleas' (1849); a 'Treatise on Medical Jurisprudence'; 'The Conflict of Laws' (1872); 'The Law of Agency and Agents' (1876); 'Commentary on the Law of Contracts' (1882); 'Treatise on the Law of Evidence and Criminal Issues.'

Wharton, Philip, Duke of, English politician: b. December 1698; d. Tarragona, Spain, 31 May 1731. At 16 he married clandestinely and in 1716 traveled on the continent, and visited the Pretender at Avignon. That prince, gratified by his attentions, gave him the title of Duke of Northumberland. About the end of 1716 he returned to England, and thence to Ireland, where he possessed a peerage, and was allowed, although not yet 19, to take his seat in the Irish House of Peers. He obtained a British dukedom in 1718 and on attaining his majority made his appearance in the English Parliament, where he distinguished himself as the defender of Bishop Atterbury, impeached as an adherent to the House of Stuart. He also published a virulent opposition paper called 'The True Briton.' He later entered the Spanish service and in 1727 served against the British at the siege of Gibraltar, for which he was in the following year attainted. His Life and Writings appeared in 1732. Consult Robinson, 'Philip, Duke of Wharton' (1896).

Wharton, Thomas, American journalist: b. Philadelphia, Pa., 1 Aug. 1859; d. there 6 April 1896. He was graduated from the University of Pennsylvania in 1879, joined the editorial staff of the Philadelphia Times in 1883 and at the time of his death was Sunday editor of that journal. He published 'A Latter-Day Saint' (1884); 'Hannibal of New York' (1886). His short story 'Bobbo' enjoyed wide popularity and was republished, prefixed by a biographical sketch of the author by Owen Wister as 'Bobbo' and Other Fancies' (1897). 'Bobbo' was dramatized and successfully played in England.

Wharves and Wharf Construction, the modern methods of wharf construction vary but little (except as to minor details) from the methods of the ancients. The process of constructing timber piers or wharves as practised in all of the ports of the Atlantic and Pacific seaboard is as follows: Piles of the best obtainable timber (generally pine or oak) are first driven to a solid foundation into the material forming the bottom of the harbor; these are designated as standard piles and are spaced from 6 to 10 feet from centres longitudinally and transversely (see Fig. 1), according to the desired carrying capacity of the wharf. These piles are then sawed off at the proper height above the tide level and on their tops (and fastened thereto with wrought iron drift bolts) are placed timbers of yellow pine (generally) 12 inches square. These timbers are known as the caps of the wharf. On these caps are placed what are generally designated as stringers or floor beams. They are generally four inches thick and vary from 12 to 16 inches in depth, according to the load to be sustained. They are fastened to the caps of the wharf with spike-pointed wrought iron drift bolts. The stringer system is placed about 2 feet on centres on this

WHARVES AND WHARF CONSTRUCTION

superstructure; the covering planks from 3 to 6 inches in thickness being fastened with the ordinary commercial spike of requisite length. After this portion of the wharf is finished nothing remains but to protect the same, either with a system of piles driven along the side used for mooring vessels (usually called fender piles and which are fastened to the superstructure of the wharf) and are sometimes additionally protected by wearing strips of timber and plank. (See Fig. 1.) A wharf projecting out from the water front line of the harbor is generally reinforced or braced by means of brace or batter piles driven on both sides of the wharf (see Fig. 1) at an angle of about 35° with the perpendicular and they are fastened to the outside stringer as shown. The above describes more particularly, the wharves as constructed on the Pacific coast and in use in San Francisco since 1880. These wharves are 100 feet in width and about 600 feet in length.

New York Wharves.—In New York city, in wharves of the same area, contractors use about double the number of standard or bearing piles (with the exception of the four outer bents) as were used in those of San Francisco. The piles are driven 10 feet from centre to centre

tened to the before mentioned sub-caps and the other to the backing block; between these vertical fenders there are placed intermediate fenders of the same material but reaching merely between the two longitudinal fenders. In place of mooring piles there is used a cast iron mooring bit. The four outer bents of the wharves are spaced about 20 feet from centre to centre. They consist of a double row of piles, each row containing the same number of piles as are under the regular caps, or making this row of double the carrying capacity of those caps. The end piles in each of these bents and the sheathing are so arranged that they present a rounded edge to the current. This is covered for a distance of 4 feet with an armature of boiler steel one half inch in thickness and 6 feet in height, securely fastened to piles and sheathing. The wider spacing of the outer bent, the additional bracing and armature plates are for protection against floating ice. The timber for superstructure used there is what is known as hard yellow pine. The standard piles are generally of spruce and vary from 50 to 60 feet in length. The wharf timbers rarely exceed 30 feet in length.

Boston Wharves.—The ordinary wooden

FIG. 1.—Cross Section through Ordinary Wharf.

longitudinally and about 5 feet transversely; the outer pile in each bent is cut off one foot below the grade of the balance and is capped with a longitudinal sub-cap 12 inches square. The balance of the standard piles in each bent are cut off to conform with a crown of four inches in a 60-foot wharf and are capped transversely with 12x12-inch timbers. The piles after being stayed into position, are mortised into caps having tenons $7\frac{1}{2}$ inches wide longitudinally with the caps, $3\frac{1}{2}$ inches thick and 3 inches long; the caps are also drift bolted to each standard pile with a wrought iron bolt 1 inch square. (In San Francisco, the caps are merely drift bolted to each pile with a 1-inch round iron drift bolt; no tenons are used.) The stringer system, or as they call it there, rangers, are 12x12-inch timbers, spaced 5 feet apart, or so as to come directly over each standard pile, the outside stringers being composed of two pieces. The covering of the wharf is of two thicknesses of 4 inches each. In place of fender piles, the outside standard piles are utilized for fastening vertical fenders of 8x12-inch white oak timbers, extending from the sub-caps to the line of low water; there are also two lines of horizontal fenders of 8x12-inch white oak extending the entire length of the wharf (with the exception of the four outer bents); one of these is fas-

tened to the before mentioned sub-caps and the other to the backing block; between these vertical fenders there are placed intermediate fenders of the same material but reaching merely between the two longitudinal fenders. In place of mooring piles there is used a cast iron mooring bit. The four outer bents of the wharves are spaced about 20 feet from centre to centre. They consist of a double row of piles, each row containing the same number of piles as are under the regular caps, or making this row of double the carrying capacity of those caps. The end piles in each of these bents and the sheathing are so arranged that they present a rounded edge to the current. This is covered for a distance of 4 feet with an armature of boiler steel one half inch in thickness and 6 feet in height, securely fastened to piles and sheathing. The wider spacing of the outer bent, the additional bracing and armature plates are for protection against floating ice. The timber for superstructure used there is what is known as hard yellow pine. The standard piles are generally of spruce and vary from 50 to 60 feet in length. The wharf timbers rarely exceed 30 feet in length.

wharves of Boston are constructed as follows: Standard piles, generally of oak, are driven 9 feet transversely and 10 feet longitudinally. They are bound together transversely on top with two girder caps of 6x10-inch hard pine and fastened to piles with 1-inch screw bolts; the girder caps are let into the piles so that the same are spaced 3 inches apart. The outside stringers are of 10x12-inch and all inside stringers of 6x12-inch hard pine, spaced 2 feet from centre to centre. The wharves are covered with 3-inch hard pine planks. The wharves are braced by brace piles called there spur-shores; they are of oak and are shouldered against the outer standard pile at about one foot below mean high water and fastened thereto with $1\frac{1}{4}$ inch screw bolts. In addition to bracing with piles, each bent has a set of cross-braces of 4x8-inch oak, running from a point about 2 feet above mean low water to the underside of the girder caps. These braces are fastened to each standard pile at each intersection with 1-inch screw bolts; a horizontal tie of 4x8-inch oak is also placed 1 foot above mean low water and fastened to each pile with 1-inch screw bolts. Fender piles of oak are driven in transverse lines with standard piles close up against the outer ones, and fastened thereto just below the girder cap with $1\frac{1}{4}$ inch screw bolts. The fender piles are cut off 9 inches

WHARF CONSTRUCTION.

Views of new Howard Street Wharf, San Francisco, Cal., showing the wooden cylinder pier
system of construction.

WHARVES AND WHARF CONSTRUCTION

below the top of the planking and are capped with 12 x 12-inch hard pine caps running longitudinally. These caps answer as longitudinal fenders and projecting 3 inches above the planking also as a curb or backing block. Mooring piles of oak are driven just inside of outer stringers and are held in place by 4-inch planks fitted down into adjoining stringers and around mooring piles. The corners of these wharves are similarly piled and finished as are the wharves of Philadelphia and New York. A safe load for these wharves would be about 300 pounds to the square foot.

Philadelphia Wharves.—These wharves, with the exception of two outer bents, are constructed as follows: Standard piles are, as prescribed by the rules of the Board of Port Wardens, driven in bents located longitudinally, 10 feet from centre to centre. The piles in these bents are 5 feet apart from centres transversely and before being cut off at the proper level, they are straightened and stay lathed into position. They are then bound together transversely with girder plank of 6 x 12-inch, gained into piles, equally on each side, leaving a tenon of 4 inches thick, 12 inches long and the width

stringer of 12 x 14 inches and intermediates of 6 x 14 inches laid 2 feet 6 inches from centres. They are dapped or gained out at caps 1 inch. The floor is composed of two layers of 3-inch plank, dressed to a uniform thickness; the first is laid at right angles to the axis of the wharf, and the planks are placed 6 inches apart, these spaces over the stringers being filled solid for the full width of the same. The planks in the outer section of this layer, about 12 feet in length, are creosoted with 14 pounds of dead oil to the cubic foot; they are fastened to the stringers with wrought spikes one half inch square and 7 inches long. The sheathing plank or upper layer are laid close and at an angle of 45 degrees with the axis of the wharf and are spiked to the lower plank with 5-inch wire nails averaging 3 feet apart. The backing log or curb is a 10 x 12-inch white oak timber, raised above the planking of the wharf and supported on blocking of 2 x 12 inches, laid 5 feet apart. Fender and brace piles are used only on the outer bents. The usual system of fenders is a series of 6 x 8-inch white oak timbers placed horizontally around the wharf between the top and the line of mean low water.

FIG. 2.—Cross Section through Wooden Cylinder Pier.

being the full diameter of the pile. They are fastened to each pile with two screw bolts. The cap proper is a single piece of 8 x 16 inches laid on its flat, covering the pile and being flush on each edge with the girders; they are drift-bolted to the piles and well spiked to the girder planks or clamps as they are called. The wharf is braced in the following manner: At the line of mean low water two girders of 5 x 10 inches are fastened to each pile in each bent, one on either side of the pile; the spaces between these planks and the four outer piles on each side are chocked with 12 x 12-inch timbers securely bolted to the girder plank. The bents are then diagonally braced with "A" braces of 5 x 10 on each side, making four in number, dividing the said bent into two panels, that is, a set of braces extend from the girder either way from the centre of the wharf to a point at the underside of the deck line, distant from the outside of wharf one fourth of its entire width. From the outside of wharf, at this same lower girder, another set extends to the bottom deck, and, meeting the first set, they are bolted to each pile at each intersection with galvanized screw bolts. The stringer system is composed of an outside

They are placed about 6 inches apart and are fastened to vertical furring pieces of 8 x 12-inch yellow pine which are bolted to the front row of standard piles in each bent, these piles being surfaced off to receive them. The two outer bents are constructed as to spacing, protection, number of piles and braces as are the New York wharves. They have rounded corners, white oak fender piles, and in addition, fender piles at the ends of these two outer bents; they have also brace piles and corner bands and chocks connecting fender piles.

Comparisons.—Comparing the construction of eastern wharves with those of San Francisco, leaving aside those parts in the eastern wharves which are designed to resist the floating ice, the details of the construction of the San Francisco wharves are simpler; having no gains or tenons, they are not so apt to suffer from dry rot; and the fact of having but few joints in caps and stringers, they are, consequently, in this respect superior to the eastern structures. The construction of the San Francisco wharves is, however, greatly owing to the better materials at their disposal, and for which the coast is famous. The length of timbers for wharf con-

WHARVES AND WHARF CONSTRUCTION

struction in the East very rarely exceeds 40 feet, but generally timbers up to 30 feet in length only, are specified and used. In San Francisco wharves, timbers of from 60 to 100 feet and over in length are frequently employed and are to be had with only a very small additional cost. With piles it is the same, in Eastern wharf construction; a pile 60 feet long is considered a very long pile, whereas on the Pacific coast, piles from 100 to 130 feet in length can be had at any time. The life of the superstructure of the above described wharves, especially if covered with sheds and buildings, is from 15 to 25 years, aside from the actual wear of the planking, but in sea water the life of an unprotected pile is from six months to three years owing to the ravages of the marine pests.

Marine Pests.—The most destructive of these are the *Teredo Navalis* or ship worm and

although they are sometimes less than 1-32 of an inch apart, or from the surface. The teredo enters the timber at the ground level and works upward, generally about 2 feet above low water although it will attack floating timber and I have found the wooden floats or buckets of a ferry steamer making half hour trips for 18 hours at a stretch and almost constantly in motion, completely destroyed by the teredo. It was a theory at one time that the bark on a pile was a protection against the Teredo. While this is true to a certain extent, I have seen piles taken from some of the old wharves in San Francisco Bay that were badly eaten by these worms, the bark being otherwise intact. The limnoria terebrans resembles a wood louse in appearance. It is about the form and size of a grain of wheat; it works between high and low water and is very destructive. It completely destroys the pile between the tide lines avoiding all metal fastenings and knots in the wood. The borings are so close together that the wood is completely disintegrated; ends and joints of timbers seem to be the most favorable points of attack. The protection of piles and timbers from these marine pests has been the study of engineers and scientists for many years and millions have been expended on experiments with varying success. In the direct preservation of piles proper, two methods have been followed. The first and longest in use is impregnating it with chemicals that are destructive to animal life and the second is by covering the pile with an insoluble armor or artificial bark impervious to the worms.

Creosoting.—Without doubt the creosoting process is the most valuable and efficient of all processes known for prolonging the life of timber. The process was invented in England about the same time that kyanizing and the other metallic salt antiseptics came into use; it has survived all other processes and is used to a greater extent than any other method both in Europe and this country. The creosote is derived from the destructive distillation of wood and coal and consists of oil products designated as dead oil when derived from the distillation of coal or coal tar and wood creosote oil when derived from the distillation of wood or phenic tar. The dead oil contains naphthaline, phenic or carbolic acid and other powerful antiseptics which change the chemical nature of the sap by forming therewith soluble compounds while the naphthaline rendered sufficiently fluid by preliminary heating, enters the wood cells, solidifies and becomes permanently fixed, mechanically coating and protecting the fibres against formation of fungi. The wood creosote contains paraffine, pyroligneous acid and other antiseptics. Advantages claimed for this oil are that its penetrating power is much greater and less expensive than dead oil and that it is equally insoluble in water. The limited use of this oil seems to confirm these claimed advantages but cannot be considered conclusive until more definitely established by further experience and the test of time. All experts on preservation of timber agree on one point and that is that the density of timber must be favorable to impregnation; in other words, only open pored timbers should be used for treatment with creosote, this having the least liquidity and therefore the hardest of all preservative chemicals to force into and

the *Limnoria Terebrans*. The teredo navalis is worm-shaped being from 6 inches to 14 inches in length and one fourth of an inch in diameter. It is of gelatinous nature and translucent. Its head is provided with calcareous substance or shell in two parts working on a hinge which performs the office of an auger. The head, like the body, completely fills the cavity bored and the outward appearance of the pile attacked shows no indication of the destruction going on within. Having once entered the timber it never works out nor will one cross another hole

WHARVES AND WHARF CONSTRUCTION

thoroughly impregnate the wood. The Oregon pine or yellow fir used on the Pacific coast is considered too dense to permit a thorough impregnation and if treated with creosote requires a longer steaming and a greater heat to extract the sap and open the pores and also a greater pressure to force the material into the wood. The consequences therefrom have been checking and cracking the timber making it brittle and when used for piles has checked them so extensively that the limnoria has found in and behind these cracks sheltered places in which it has done its destructive work under cover and more rapidly than when exposed to swell and current. It has also made examination of those piles more difficult as the outer shell of the pile was apparently unattacked while the inner portion of the same was entered and destroyed by the limnoria. All authorities in writing on the preservation of piles for marine work seem to ignore the existence of the limnoria terebrans. In my opinion it is much more destructive on the Pacific coast than is the teredo and while a pile that has been thoroughly creosoted will resist the teredo, even if somewhat checked, the limnoria will find the slightest opening and destroy the pile. There have

substantial. Another protection against these marine pests is what is known as the built pile; it consists of a pile built up from a core of 6 x 6 with 1-inch boards until the same forms a pile 12 inches square, each layer being tarred and sanded. It is built on the theory that the teredo is loath to cross a seam and the test pile taken from Section I. of the seawall, a particular feeding ground of the teredo, after 10 years' immersion, verified this theory. But this was a case of again ignoring the ever active limnoria and piles built since have shown that the limnoria found a home in the seams of the boards of which the pile was constructed. However, an improvement was made in the details of construction, at my suggestion, which has resulted in keeping the limnoria out, and that was the placing of ship felt between the last two layers of boards from high water to 2 feet below low water (limnoria working only between high and low water). The result has been quite satisfactory, although I think that a time test of a large quantity of piles is the only satisfactory one. In many of the government piers where the teredo and limnoria are particularly active, numerous iron piles have been used, both wrought and cast. These are

FIG. 4.—Side Elevation.

been several methods for the preservation of piles in San Francisco harbor by means of an exterior covering or artificial bark, some of which have been more or less successful, the success depending upon the durability of the covering, or, in other words, the life of the pile is the life of the artificial bark. The one making the best showing, from the fact that it has been the longest in use, is what is known as the Paraffine Paint Company's method. It consists of a covering of P. & B. pile covering, covered with battens which have been treated with P. & B. paint. I think the secret of the success of this process is the fact that it is applied cold. Previous coverings of this character having been applied hot to a wet pile, no adhesion was obtained between covering and the pile for the reason that the hot material draws the moisture to the surface. This difficulty claims to have been avoided by the parties using what is known as the Perfection Process, by kiln-drying the piles before covering. Said process consists in covering the piles spirally with a double thickness of burlap treated with asphalt, the application or winding of the burlap being done by means of a large lathe in which the piles are turned. This covering has not had sufficient time test to pass on its merit, although it looks

prohibitory in many places for the reason of the excessive cost of the material and construction, most of the piles having either to be screwed into the bottom or driven with a water jet. Another objection is the rapid destruction by oxidization of the joints in the bracing system.

Cylinder Construction.—A mode of construction which has been very successful on the Pacific coast was invented by the writer and has been in use in the San Francisco harbor for the past ten years and has not as yet shown any latent defects. It is what is known as the wooden cylinder pier construction. (See Fig. 2.) The foundation proper consists of cylinders of concrete and piles placed about 15 feet on centres. The details of construction are as follows: The core consists of one or more piles, generally three; these are driven to a firm foundation and are left at different heights from the finished top of the proposed wharf, for example, say one pile is 30 feet in length, one 55 feet and one 60; this is for two reasons: first, for economy, as in the San Francisco Bay most of the piles depend absolutely on the friction of the mud for sustaining purposes (there being no known bottom) and it will readily be seen that the 50-foot piles will be as deep in the mud as the 60; secondly, it admits of a larger body of

WHAT CHEER—WHATELY

concrete at the top of the cylinder where required. After this cluster of piles is driven, there is then driven over and encircling same a wooden stave cylinder, generally four feet inside diameter; these staves are from 3 to 4 inches thick and bound together with wrought iron hoops having adjustable lugs; these hoops are placed about 2 feet on centres and the cylinder is made perfectly water tight. It is driven with an ordinary pile driving machine to from 10 to 15 feet into the mud. The water and mud in the interior is then pumped out to a depth of from a foot to 5 feet below the mud on the outside; then inside of this cylinder of wood, between it and the piles, is placed an interior cylinder of expanded metal or similar metallic interstitial web about 1 foot less in diameter than the interior of the wooden cylinder. The interior is then filled with a rich concrete of hydraulic cement and broken rock. The cylinder pier is complete and forms a teredo proof concrete pier, having a wooden core reinforced with an interstitial web of expanded metal and protected for at least four years with an iron bound wooden jacket. (See Fig. 3.) These cylinders are then capped with caps of structural steel, generally two 15-inch I beams and the balance of the superstructure is as in the ordinary wharf. The fender system is somewhat different from that in general use and is as follows: The fender piles are driven in pairs about 10 feet apart and about 1 foot away from the wharf proper; they are connected together longitudinally with a ribbing composed of three timbers both at the surface and below the top of wharf. (See Fig. 4.) Between these fender piles and the outside stringer are placed a nest of heavy spiral springs similar to those used on a buffer in a freight car. This is the only direct connection between the wharf proper and the fenders; the upper ribbing at the surface of the wharf acts in the dual capacity of a curb for the wharf and a support for the fender line. This spring fender line saves the jar to both vessel and wharf and in ordinary choppy weather there is not the slightest motion to the wharf; it also saves the wear on the fender piles as these last but from one to two years, due to wear and breakage. For example, in pier No. 12, San Francisco, used by the United States transport steamers, the fender piles with the spring system have been in use since 1896 without a single renewal, while at pier No. 4 used by steamers of half the tonnage, all the fenders have been renewed twice in that period of time. There are at present constructed in San Francisco harbor and in course of construction, seven of these wharves 100 feet wide, 600 feet long, and six wharves 120 feet wide and 800 feet long, aggregating a cost of \$1,000,000, and also at Long Beach, Cal., near Los Angeles, a double deck pleasure wharf costing \$100,000. The cylinder pier system construction has been used by the Santa Fe System, the North Shore Railroad Company, and the San Francisco, Oakland and San Jose Railway Company, and is to be used by the Pacific Mail Steamship Company in the construction of four new piers. See Dock; Pier.

HOWARD C. HOLMES,
Chief Engineer, San Francisco Dry Dock Co.

What Cheer, Iowa, city in Keokuk County; on Coal Creek, and on the Chicago & N., and the Burlington, C. R. & N. R.R.'s; about 70

miles southeast of Des Moines. It is in an agricultural and coal mining region, and has several industries connected with farm and dairy products. It has six churches. The two banks have a combined capital of \$80,000. Pop. (1880) 719; (1890) 3,246; (1900) 2,746; (1910) 1,720.

What-cheer, in Rhode Island, a watchword or shibboleth, derived from the fact that the Indians of the colony thus greeted Roger Williams and his companions, when they first landed on the Sekonk River near the present site of Providence.

Whatcom, hwô't'kôm, Wash., city, county-seat of Whatcom County; on Bellingham Bay, and on the Great Northern, the Northern P., and the Bellingham Bay & B. C. R.R.'s; about 79 miles north of Seattle. It has an excellent harbor, and steamer communications with the Puget Sound and the Pacific ports. A State road extends over the Cascade Mountains, across the Mount Baker Pass, to the gold and silver mines and to the grazing lands on the Columbia River. Four miles from the city is the Corn-wall coal mine. The water-supply (gravity system) is obtained from Lake Whatcom, four miles distant. The city has a good sewerage system, electric-light plant, and electric railway. The court-house, city hall, schools, and churches are the principal buildings. It has the State Normal School, a high school, graded elementary schools, and a library. The three banks have a combined capital of \$215,000 and deposits amounting to over \$1,250,000.

In December 1890 the old city of Whatcom and the town of Schome were consolidated and called New Whatcom. In 1903, New Whatcom and Fairhaven were consolidated under the name of Bellingham. Pop. (1890) Whatcom, 4,099; Schome, 2,700; Bellingham (1910) 24,298.

Whately, hwât'li, Richard, English prelate, Archbishop of Dublin: b. London 1 Feb. 1787; d. Dublin 8 Oct. 1863. He was educated at Oriel College, Oxford, and in 1819 made his first appearance as an author by publishing his since famous 'Historic Doubts relative to Napoleon Bonaparte.' This pamphlet is among the most popular of the author's writings, more than 12 editions of it having been published. Its object is to show that objections of the same kind as those brought forward by skeptical writers of the truth of the gospel narratives, founded on apparent inconsistencies and absurdities in these narratives, may be brought against any well known and incontrovertible piece of history, such as that of Napoleon Bonaparte. In 1822 Whately delivered the Bampton lectures at Oxford, 'On the Use and Abuse of Party Feeling in Matters of Religion.' The same year he received the living of Halesworth in Suffolk, and was appointed principal of Saint Alban's Hall, Oxford, in 1825. In 1825 he published 'Essays on Some of the Peculiarities of the Christian Religion' (7th ed. 1860). A second series of essays 'On Some Difficulties in the Writings of Saint Paul and in Other Parts of the New Testament' appeared in 1828 (6th ed. 1849); and a third series, 'The Errors of Romanism traced to their Origin in Human Nature,' in 1830 (5th ed. 1856). In 1825 was published perhaps the most widely known of his works, 'The Elements of Logic,' and the scarcely less popular 'Elements of Rhetoric' in 1828. Both have passed through many editions, and like all his
